Serpukhoff is one of the oldest towns of the principality of Moscow; it is mentioned in the will of Ivan Daislovich (1328), at which time it was a nearly independent principality under the protectorate of Moscow. Its fortress, protecting Moscow on the south, was often attacked by the Tatars; Toktamish plundered it in 1382, and the Lithuanian prince Svidrigaito in 1410. In 1556 the town was strongly fortified, so that fifteen years later it was able to resist the Mongol invasion. Its commercial importance dates from the 18th century.

SERTORIUS, Quintus. The life and career of the Roman Sertorius, a man of remarkable genius both as a general and as a statesman, may be said to be comprised between the years 105 and 72 B.C., a period of civil war and revolution in the Roman world, when every man of any mark had to be an adherent either of Sulla or of Marius. Sertorius, who came from a little Sabine village under the Apennines and was a self-made man, attached himself to the party of the latter, and served under him in 102 B.C. at the great battle of Aquæ Sextiæ (Aix), in which the Teutones were decisively defeated. Three years before he had witnessed the rout of a Roman army by the Cimbri on the Rhone. In 97 he was serving in Spain and thus had a good opportunity of making himself acquainted with the country with which his fame is chiefly associated. In 91 he was quæstor in Cisalpine Gaul, and on his return to Rome he met with such a hearty welcome that he would have been elected to the tribuneship but for the decided opposition of Sulla. He now declared himself for Marius and the democratic party, though of Marius himself as a man he had the worst opinion. He must have been a consenting party to those hideous massacres of Marius and Cinna in 87, though he seems to have done what he could to mitigate their horrors by putting a stop to the outrages perpetrated by the scum of Marius's soldiery. On Sulla's return from the East and the war with Mithradates in 83, Sertorius left Rome for Spain, where he represented the Marian or democratic party, but, it would appear, without receiving any definite commission or appointment. Here he passed the remainder of his life, with the exception of some cruises in the Mediterranean in conjunction with Cilician pirates, and of a campaign in Mauretania, in which he defeated one of Sulla's generals and captured Tingis (Tangier). This success recommended him to the Spaniards, more particularly to the Lusitanian tribes in the west, whom Roman generals and governors of Sulla's party had plundered and oppressed. Brave and kindly and gifted with a rough telling eloquence, Sertorius was just the man to impress Spaniards favorably, and the native militia, which he organized, spoke of him as the "new Hannibal." Many Roman refugees and deserters joined him, and with these and his Spanish volunteers he completely defeated one of Sulla's generals and drove Metellus, who had been specially sent against him from Rome, out of Lusitania, or Further Spain as the Romans called it. Sertorius owed much of his success to his statesmanlike ability, and it seems that he aspired to be in Spain what the great Agricola afterwards was in Britain. His object was to build up a stable government in the country with the consent and coöperation of the people, whom he wished to civilize after the Latin model. He established a senate of 300 members, drawn from Roman emigrants, with probably a sprinkling of the best Spaniards. For the children of the chief native families he provided a school at Osca (Huesca), where they received a Roman education and even adopted the dress of Roman youths. Strict and severe as he was with his soldiers, he was particularly considerate to the people generally and made their burdens as light as possible. It seems clear that he had a peculiar gift for evoking the enthusiasm of rude tribes, and we can well understand how the famous white fawn, which was his constant companion, may have promoted his popularity. For six years he may be said to have really ruled Spain. In 77 he was joined by Perpenna, one of the officers of Lepidus, from Rome, with a following of Roman nobles, and in the same year the great Pompey, then quite a young man and merely a knight, was sent by the senate to take command in Spain and with Metellus to crush Sertorius. The war was waged with varying success, but on the whole Sertorius proved himself more than a match for his adversaries, utterly defeating their united forces on one occasion near Saguntum. Pompey wrote to Rome for reinforcements, without which, he said, he and Metellus would be driven out of Spain. Rome's position was very critical, the more so as Sertorius was in league with the pirates in the Mediterranean, was negotiating with the formidable Mithradates, and was in communication with the insurgent slaves in Italy. But owing to jealousies among the Roman officers who served under him and the Spaniards of higher rank he could not maintain his position, and his influence over the native tribes slipped away from him, though he won victories to the last. In 72 he was assassinated at a banquet, Perpenna, it seems, being the chief instigator of the deed.

What we know of Sertorius is mainly drawn from Plutarch's *Lives*, from Appian, and from the fragments of Sallust. There is a good life of him by G. Long in Smith's *Class. Dict.*

SERVANT, See Master and Servant.

SERVETUS, Michael, or Miguel Serveto (1511–1553), physician and polemic, was born in 1511[1] at Tudela in Navarre (according to his Vienne deposition), his father being Hernando Villanueva, a notary of good family in Aragon. His surname is given by himself as Serveto in his earliest works "per Michaelem Serueto, alias Reues." Later he Latinized it into Servetus, and even when writing in French (1553) he signs "Michel Seruetus."[2] It is not certain that he was related to his contemporary Andrès Serveto of Aniñon, the Bologna jurist; but it is probable that he was of the same family as the Spanish ecclesiastic Marco Antonio Serveto de Reves (d. 1598), born at Villanueva de Sigena in the diocese of Huesca (Latassa, *Biblioteca Nueva*, 1798, i. 609). Servetus, who at Geneva makes "Villeneufve" his birthplace, fixes it in the adjoining diocese of Lerida, in which there are three villages named Vilanova. Having apparently had his early training at the university of Saragossa, he was sent by his father to study law at Toulouse, where he first became acquainted with the Bible (1528). From 1525 he had found a patron in Juan de Quintaña (d. 1534), a Franciscan promoted in 1530 to be confessor to Charles V. In the train of Quintaña he witnessed at Bologna the coronation of Charles in February, 1530, visited Augsburg, and perhaps saw Luther at Coburg. The spectacle of the adoration of the pope at Bologna had strongly impressed his mind in an anti-papal direction. He left Quintaña, and, after visiting Lyons and Geneva, repaired to Œcolampadius at Basel, whence he pushed on to Bucer and Capito at Strasburg. A crude, but

[1] This date rests upon his own testimony as to his age (both at Vienne and Geneva) and that of Calvin. An isolated passage of his Geneva testimony may be adduced in support of 1509.

[2] The form "Servet" first appears in a letter of Œcolampadius to the senate of Basel (1531), and is never used by himself. "Servede" is an imaginary form.

very original and earnest theological essay, *De Trinitatis Erroribus*, printed at Hagenau in 1531, attracted considerable attention; Melanchthon writes "Servetum multum lego." It was followed in 1532 by a revised presentation of his argument. We next find Servetus at Lyons, in 1535, as an editor of scientific works for the printing firm of Trechsel, under the name of Michel de Villeneufve or Michel Villanovanus, which he used without interruption till the year of his death. Here he found a friend in Dr. Symphorien Champier (Campegius) (1472–1539), whose profession he resolved to follow. Accordingly he went (1536) to Paris, where he studied medicine under Johann Günther, Jacques Dubois and Jean Fernel. It was in 1536, when Calvin was on a hurried and final visit to France, that he first met Servetus at Paris, and, as he himself says, proposed to set him right in theological matters.[1] As assistant to Günther, Servetus succeeded the famous anatomist Vesalius; Günther, who pays the highest tribute to his general culture, describes him as specially skilled in dissection and "vix ulli secundus" in knowledge of Galen. He graduated in arts and asserts that he also graduated in medicine, published a set of lectures on syrups (the most popular of his works), lectured on geometry and astrology, and defended by counsel a suit, brought against him (March, 1538) by the medical faculty on the ground of his astrological lectures. In June, 1538, we find him at the university of Louvain (where he was inscribed on the roll of students as Michael Villanova on 14th December, 1537), studying theology and Hebrew, explaining to his father (then residing at San Gil) his removal from Paris, early in September, 1537, as a consequence of the death (8th August) of his master (el señor mi maestro), and proposing to return to Paris as soon as peace was proclaimed. After this he practiced medicine for a short time at Avignon, and for a longer period at Charlieu (where he contemplated marriage, but was deterred by a physical impediment). In September, 1540, he entered himself for further study in the medical school at Montpelier. In 1541 he resumed editorial work for the Lyons booksellers, to whose neighborhood he had returned.

Among the attendants upon his Paris lectures had been a distinguished ecclesiastic, Pierre Paulmier, since 1528 archbishop of Vienne. Paulmier invited Servetus to Vienne as his confidential physician. He acted in this capacity for twelve years (1541–53), and made money. Outwardly he conformed to Roman Catholic worship; in private he pursued his theological speculations. It is probable that in 1541 he had been rebaptized. He opened a correspondence with Calvin, and late in 1545, or very early in 1546, he forwarded to Calvin the manuscript of a revised and enlarged edition of his theological tracts, and expressed a wish to visit him at Geneva. Calvin replied on 23d February, 1546, in a letter which is lost, but in which, he says, he expressed himself "plus durement que ma coustume ne porte." On the same day he wrote to Guillaume Farel, "si venerit, modo valeat mea autoritas, vivum exire nunquam patiar," and to Pierre Viret in the same terms. Servetus had fair warning that if he went to Geneva it was at his peril. In his letter to Abel Pouppin (in or about 1547), after stating that he had failed to recover his manuscript from Calvin, he says, "mihi ob eam rem moriendum esse certo scio." The volume of theological tracts, again recast, was declined by a Basel publisher in April, 1552, but an edition of 1000 copies was secretly printed at Vienne. It was finished on 3d January, 1553; the bulk of the impression was privately consigned to Lyons and Frankfort, for the Easter market. But on 26th February a letter, enclosing a sheet of the printed book, and revealing the secret of its authorship, was written from Geneva by Guillaume H. C. de Trye, formerly *échevin* of Lyons, to his cousin Antoine Arneys in that city. This letter bears no sign of dictation by Calvin; the history of De Trye shows that it may have been instigated in part by personal ill-feeling towards the Lyons booksellers. But Calvin furnished (reluctantly, according to De Trye) the samples of Servetus's handwriting enclosed in a subsequent letter, for the express purpose of securing his conviction. The inquisitor-general at Lyons, Matthieu Ory, set to work on 12th March; Servetus was interrogated on 16th March and arrested on 4th April. Under examination his defence was that, in correspondence with Calvin, he had assumed the character of Servetus for purposes of discussion. At 4 A.M. on 7th April he escaped from his prison, evidently by connivance. He took the road for Spain, but turned back in fear of arrest. How he spent the next four months is not known; Calvin believed he was wandering in Italy; the idea that he lay concealed in Geneva was first started by Spon. On Saturday, 12th August, he rode into Louyset, a village on the French side of Geneva. Next morning he walked into Geneva, and ordered a boat, to take him towards Zurich on his way for Naples. He was recognized that day at church and immediately arrested. The process against him lasted from 14th August to 26th October, when sentence "estre brusle tout vyfz" was passed, and carried out next day at Champel (27th October, 1553). Calvin would have had him beheaded. Meanwhile the civil tribunal at Vienne had ordered (17th June) that he be fined and burned alive; the sentence of the ecclesiastical tribunal at Vienne was delayed till 23d December. Jacques Charmier, a priest in Servetus's confidence, was condemned to three years' imprisonment at Vienne. The life of Servetus is full of puzzles; his writings give the impression not only of quick genius but also of transparent sincerity; they throw, however, little light on the mysterious parts of his story. Don Pedro Gonzalez de Velasco (see his *Miguel Servet*, 1880) has placed a statue of Servetus in the porch of the Instituto Antropologico at Madrid.

The opinions of Servetus, marked by strong individuality, are not easily described in the terms of any current system. His anabaptism, with his denial of the tripersonality of the Godhead and of the eternity of the Son, made his views abhorrent to Catholics and Protestants alike; while his intense Biblicism, his passionate devotion to the person of Christ, and the essentially Christocentric character of his view of the universe give him an almost unique place in the history of religious thought. He is sometimes classed with the Arians; but he indorses in his own way the homoousian formula, and speaks contemptuously of Arius as "Christi gloriæ incapacissimus." He has had many critics, some apologists (*e.g.*, Postel and Lincurius), and few followers. The fifteen condemnatory clauses, introducing the sentence of Servetus at Geneva, set forth in detail that he had been found guilty of heresies, expressed in blasphemous language, against the true foundation of the Christian religion. It is curious that one instance of his injurious language is his employment of the term "trinitaires" to denote "ceux qui croyent en la Trinite." No law, current in Geneva, has ever been adduced as enacting the capital sentence. Claude Rigot, the procureur-général, examined Servetus with a view to show that his legal education must have familiarized him with the provisions of the code of Justinian to this effect; but in 1535 all the old laws on the subject of religion had been set aside at Geneva; the only civil penalty for religion, retained by the edicts of 1543, was banishment. The Swiss churches, while agreeing to condemn Servetus, give no hint of capital punishment in their letters of advice. The extinct law seems to have been arbitrarily revived for the occasion. A valuable controversy followed, on the question of executing heretics, in which Beza (for), Mino Celsi (against), and several caustic anonymous writers took part.

The works of Servetus are not so rare as is often supposed, but the most common are his earliest, in which he approaches nearer to the position afterwards taken by F. Socinus than he does in his more matured publications. The following is an enumeration of them in the order of their appearance. (1) *De Trinitatis Erroribus Libri Septem*, 1531, 16mo. (2) *Dialogorum de Trinitate Libri Duo*, 1532, 16mo; four chapters are added on justification and kindred topics. These two books have been twice reprinted and

[1] Beza incorrectly makes Servetus the challenger and the date 1534.

manuscript copies are common; a Dutch version, by Reynier Telle, was published in 1620. (3) *Claudii Ptolomæi Alexandrini Geographicæ Enarrationis Libri Octo: ex Bilibaldi Pirckheymeri translatione, sed ad Græca et prisca exemplaria a Michaele Villanovano jam primum recogniti. Adjecta insuper ab eodem scholia*, etc., Lyons, (Melchior & Caspar Trechsel), 1535, fol.; 2d ed., Lyons (Hugo à Porta), 1541, *i.e.*, 1542; printed by Caspar Trechsel at Vienne, fol.; on this work Tollin founds his high estimate of Servetus as a comparative geographer; the passage incriminated on his trial as attacking the authority of Moses is an extract from Lorenz Friese. (4) *Brevissima Apologia pro Symphoriano Campegio in Leonardum Fuchsium*, 1536, 12mo; no extant copy is known; Tollin has reprinted an extract from it. (5) *Syruporum Universa Ratio*, etc., Paris, 1537, 16mo; there were four subsequent editions, the last being Venice, 1548 (six lectures on digestion, the composition and use of syrups being treated in the fifth lecture). (6) *In quendam Medicum Apologetica Disceptatio pro Astrologia*, Paris, 1538, 16mo; reprinted, Berlin, 1880; the *medicus* is Jean Tagault, who had interrupted the lectures of Servetus on astronomy, under which he included meteorology. (7) *Biblia Sacra ex Santis Pagnini Tralatione . . . recognita, et scholiis illustrata*, etc., Lyons (Hugo à Porta), 1542, fol., remarkable for its theory of prophecy, explained in the preface and illustrated in the notes. (8) D'Artigny says that Servetus "fit les argumens" to a Spanish version of the *Summa* of Aquinas; but nothing is known of this or of the "divers traités de grammaire" which he translated from Latin into Spanish. (9) *Christianismi Restitutio*, etc., 1553, 8vo (perfect copies in Vienna and Paris, an imperfect copy in Edinburgh), partly reprinted, London, 1723; 4to (copies in London and Paris), reprinted 1790; 8vo, by Rau at Nuremberg for de Murr, from the Vienna copy; manuscript copies are rare; the Paris library has a manuscript copy of an earlier recension of several books, including the often-quoted description of the pulmonary circulation. This work is often called anonymous, but the initials M. S. V. are given at the end and the full name at p. 199; the volume is not a single treatise but an assemblage of theological tracts written in a nervous and epigrammatic style and with great command of very various learning; the *Apologia* addressed to Melanchthon, with which it concludes, is in the writer's best manner. Two treatises, *Desiderius* (*ante* 1542) and de *Tribus Impostoribus* (1598), have been erroneously assigned to Servetus. Of his few remaining letters most will be found in Mosheim.

The literature relating to Servetus is very large, but the following are some of the most important pieces. Calvin's *Defensio Orthodoxæ Fidei*, etc., 1554, 4to (also in French, *Déclaration pour maintenir*, etc., 16mo, same date), is the source of many prevalent misconceptions respecting the opinions of Servetus and his attitude on his trial. De la Roche's *Historical Account*, etc., in *Mem. of Lit.*, 1711–12 (reproduced in French, *Biblioth. Angl.*, Amsterdam, 1717, 18mo), was followed by *An Impartial History*, etc., 1724, 8vo (said to be by Nathaniel Hodges, a Baptist minister, afterwards knighted). Allwoerden's *Historia*, etc., 1728, 4to (materials furnished by Mosheim), is superseded by Mosheim's *Anderweitiger Versuch*, etc., 1748, 4to, with its appendix, *Neue Nachrichten*, 1750, 4to, issued after the publication of the records of the Vienne trial by D'Artigny, in *Nouveaux Mémoires d'Hist.*, etc., vol. ii., 1749, 12mo. Chaufepié's valuable article in *Nouv. Dict. Historique*, vol. iv., 1756, fol. (translated separately by Rev. James Yair, 1771, 8vo), makes no use of Mosheim's later researches. Trechsel, in *Die prot. Antitrinitarier vor F. Socin*, etc., bk. i., 1839, 8vo, uses all available materials up to date. Since then the investigations of H. Tollin (published in a series of some forty separate articles in various journals from 1874 to 1885) have thrown light on every portion of the subject. The records of the Geneva trial, first published by De la Roche, and reproduced in Rilliet's *Relation*, etc., 1844, 8vo, and elsewhere, are best given in vol. viii. (1870) of the edition of Calvin's works by Baum, Cunitz, and Reuss; Roget, in *Hist. du Peuple de Genève*, vol. iv., 1877, has a good account of both trials. The passage describing the pulmonary circulation is first noticed by W. Wotton, in *Reflections upon Ancient and Mod. Learning*, 1694, and has given rise to a literature of its own: see especially Tollin's *Die Entdeckung des Blutkreislaufs*, etc., 1876; Huxley, in *Fortnightly Rev.*, February, 1878; and Tollin's *Kritische Bemerkungen über Harvey und seine Vorgänger*, 1882. Other physiological speculations of Servetus are noted by Sigmond (*The Unnoticed Theories of Servetus*, 1826): but it has escaped Sigmond that Servetus had an idea of the composition of water and of air. As a thinker, Servetus is claimed on superficial grounds by Unitarians (see Wallace, *Antitrin. Biog.*, 1850, i. 420), who have written several accounts of him, of which R. Wright's *Apology*, etc., 1807, 8vo., is the worst, and J. S. Porter's *Servetus and Calvin*, etc., 1854, 8vo., perhaps the best. Saisset, in *Rev. des Deux Mondes*, 1848, treats Servetus as a pantheist; he is followed by Willis, in his *Servetus and Calvin*, 1877, 8vo, a most unsatisfactory book (comp. *Theol. Rev.*, April and July, 1878). Tollin's *Das Lehrsystem Michael Servet's*, 3 vols., 1876–78, 8vo., and Pünjer's compendium *De Michaelis Serveti Doctrina*, etc., 1876, 8vo, are valuable digests of his opinions, from different points of view. Of Servetus's personal character the best vindication is Tollin's *Charakterbild Michael Servet's*, 1876, 8vo (in French with additions by Dardier, *Portrait Caractère*, 1879, 8vo). His story has been dramatized by Max Ring, *Die Genfer* (1850), by José Echegaray, *La Muerte en los Labios* (1880), and by Albert Hamann, *Servet* (1881). The recent discovery at the Record Office, London (U. 140) and the British Museum (Cotton MSS., Galba B. x.) of intercepted letters from Servetus at Louvain in 1538 adds considerably to our information about his family and early friends, but introduces new problems as to the details of his fitful career. (A. GO.)

SERVIA, a kingdom belonging to the Balkan peninsula of Europe, lying between Bosnia on the west and Bulgaria and Roumania on the east, and between the Turkish province of Albania on the south and the Austrian Military Frontier on the north. From Bosnia it is separated by the Drina, from Austrian and Roumanian territory by the Danube and the Save, and from Bulgaria partly by the Timok. Some parts of the southern frontier are indicated by mountains, but elsewhere there are no natural boundaries. In shape Servia is an irregular trapezium, situated between about 42° 30′ and 45° N. lat. and 19° and 22° 30′ E. long. The area is about 18,760 square miles, and the population (1,667,159 in 1874) was estimated at the end of 1884 to be 1,902,419, thus giving a density of about 100 to the square mile. This low density, only about one-third of that of the United Kingdom, is explained by the nature of the surface, the inland position, the defective communications with the exterior, and the absence of manufacturing industries. Plate I.

The surface is for the most part mountainous or hilly, though there are no well-defined mountain ranges of any extent. The highest summits lie near the middle of the southern frontier, where Mount Kopaonik attains the height of nearly 7000 feet. Towards the Bosnian frontier the mountains are pretty closely massed together, and some of the summits approach 4000 feet; this height is exceeded on the eastern side of the country, where the mountains, forming a continuation of the Carpathians, are in many places more rugged and precipitous than anywhere else in the kingdom. The Rudnik Mountains, which begin immediately to the north of the Servian Morava, have their highest parts in the south and gradually sink towards the north from nearly 3000 to less than 2000 feet. Still lower are the elevations in the provinces in the extreme south acquired in 1878 under the treaty of Berlin. As a general rule the Servian highlands consist of detached groups of mountains and conical hills with gentle slopes rising from verdant valleys, and they are mostly covered to the top with forests, chiefly of oak and beech, the higher summits in the south also with conifers. But the plains, though numerous, are of no great extent, and occur chiefly along the banks of the rivers. Apart from frontier rivers, the most important stream is the Morava, which, rising on the western slopes of the Kara Dagh, a little beyond the Servian frontier, enters the country with a northeasterly course near the extreme southeast, and then turns north-northwest and flows almost in a straight line through the heart of the kingdom to the Danube. In the upper part of its course it is known as the Bulgarian Morava, and only after receiving the Servian Morava on the left is it known as the Morava simply or as the Great Morava. The only other important tributary is the Nishava, which it receives from the right at Nish. The valleys of all these rivers, especially those of the Bulgarian and the Great Morava, and of the Nishava, contain considerable areas of level or low-lying country well suited for the growth of corn, and the low grounds along the Save and the Danube from the Drina to the Morava are also well adpated for agriculture, though for the most part devoted only to pasture. Altogether no more than one-sixth of the surface is estimated to be occupied by cultivated fields and vineyards, while one-fifth is estimated to form pasture land and about an equal area woodland. Nearly one-half of the entire area is believed to be unproductive. Orography.

Besides the frontier streams on the north and west, the only river of any importance for navigation is the Morava, which is navigable for steamers of light

draught as high as Tiupriia about 60 miles from its mouth, but its valley is important as the main highway of the country, and all the more since the introduction of railways. Railways both to Constantinople and to Salonica are now (1886) in course of construction under a convention concluded with Austria in 1881. The section common to the two systems, that from Belgrade to Nish, 152 miles in length, was opened for traffic in September, 1884, and the line (76 miles) from Nish to Vranja was completed in March, 1886, but the connection with the Turkish railway from Salonica remains to be completed. At present, in consequence of the unsatisfactory communication with the south, only about 7 or 8 per cent. of the Servian imports enter by the southern frontier, 85 per cent. coming through Austria-Hungary. In the beginning of 1886 work had been begun on only one-half of the line from Nish to Pirot, on the other system.

Railways.

The geological structure of Servia is varied. In the south and west the sedimentary rocks most largely developed are of ancient, pre-Carboniferous date, interrupted by considerable patches of granite, serpentine, and other crystalline rocks. Beyond this belt there appear in the northwest Mesozoic limestones, such as occupy so extensive an area in the northwest of the Balkan peninsula generally, and the valleys opening in that quarter to the Drina have the same desolate aspect as belongs to these rocks in the rest of that region. In the extreme northeast the crystalline schists of the Carpathians extend to the south side of the Danube, and stretch parallel to the Morava in a band along its right bank. Elsewhere east of the Morava the prevailing rocks belong to the Cretaceous series, which enters Servia from Bulgaria. The heart of the country—the Shumadia, as it is called—is mainly occupied by rocks of Tertiary age, with intervening patches of older strata; and the Rudnik Mountains are traversed by metalliferous veins of syenite. The mineral wealth of Servia is considerable and varied, though far from being adequately developed. Gold, silver, iron, and lead are said to have been worked in the time of the Romans. Heaps of ancient slag from lead mines still exist in the neighborhood of Belgrade, and other old lead mines occur in the valley of the Toplitza. Gold dust is washed down by heavy rains in the valley of the Timok, where it is gathered by the peasants. In the syenite veins of the Rudnik Mountains ores of lead, zinc, copper, sulphur, and arsenic are present, but are not worked; and from the mines of Krupani in the northwest argentiferous lead, antimony, and other ores have been obtained. The principal mining centre east of the Morava is Maidanpek in the north, where there is a large iron-smelting establishment in the hands of an English company. Coal or lignite is met with in many places, including a number of points on the Servian railway. The largest deposit lies round Tiupriia, and measures about 19 miles in length by 7½ in breadth. All the minerals belong to the state, but permission to work them can be obtained on payment of a moderate royalty.

Geology.

Minerals.

The climate of Servia is on the whole mild, though subject to the extremes characteristic of inland Eastern countries. In summer the temperature may rise as high as 106° Fahr., while in winter it often sinks to 13° or even sometimes 20° below zero. The high-lying valleys in the south are colder than the rest of the country, not only on account of their greater elevation, but also because of their being exposed to the cold winds from the north and northeast. Accordingly, the chief products of the soil are such as thrive under a warm summer and are unaffected by a cold winter. Both maize and wine are grown, but the olive is excluded by the severity of the cold season.

Climate.

Maize is the principal object of agriculture, the average annual crop being estimated at upwards of 5,000,000 bushels, wheat coming next with an average crop of less than 4,000,000 bushels. Besides cereals, flax, hemp, and tobacco are grown, but the attempts made to cultivate cotton have proved unsuccessful. The chief wine-growing locality is in the northeast round Negotin. Inefficient as are the implements and backward the methods of agriculture, grain makes up a considerable portion of the exports, owing to the scantiness of the population and the deficiency of other industries, and it is expected that this export will be greatly increased on the completion of the railway system to the southern seaports. The grain chiefly exported is wheat,—maize supplying, as among all the Slavs of the Balkan peninsula, the chief food of the people. Hitherto live-stock has formed the largest item in the exports, sometimes amounting to over one-half. Among these pigs, which are fed in immense numbers on the mast of the forests, take the first place. Of late years their number has greatly declined, largely in consequence of American competition; but relatively to population Servia still maintains a much greater number than any other country of Europe; and the same is true of sheep, which are here relatively more than twice as numerous as in Spain. Cattle also are numerous, but are reared solely as beasts of draught and for export. Bees are very generally kept,—the honey being consumed in the country, the wax exported. The rearing of silkworms is spreading, especially since cocoons and eggs have begun to be exported to Italy. Orchards are very extensive, and all kinds of fruit belonging to central Europe are grown in abundance,—above all, the plum, from which is distilled the favorite national spirit, *slivovitza*. The average annual value of the exports is a little over £1 [$4.86] per head of population. After live animals and grain come hides and prunes. Among the imports the chief items are sugar, salt (wholly absent in Servia), cotton goods, and other textiles. Import duties being high, a considerable amount must always be allowed for smuggled goods. Though the great bulk of the imports enter the country by the Austrian frontier, an increasingly large proportion comes originally from beyond Austria-Hungary. Thus in 1879, of the total quantity of imports across the Austrian frontier, 76 per cent. were of Austrian-Hungarian origin, in 1880 73 per cent., in 1881 65 per cent., leaving 24, 27, and 35 per cent. respectively for countries beyond. Among the latter Germany comes next after Austria-Hungary and then England. Colonial wares (sugar, coffee, etc.) are now imported cheaper by way of Hamburg than by way of Trieste.

Products.

Exports and imports.

The natural increase of population in Servia is pretty rapid, the annual birth-rate being among the highest in Europe, while the death-rate, though high, is exceeded in several other countries. During the years 1879–84 the average annual number of births was 76,962, of deaths 47,181, the excess of births over deaths 29,781, which figures compared with a total population intermediate between that at the end of 1874 and that at the end of 1884 give a birth-rate of upwards of 43 per thousand, a death-rate of less than 27 per thousand, and an annual excess of births over deaths of nearly 17 per thousand. The average proportion of male to female births is 106 : 100. The people are mainly Serbs, though the proportions have been modified by the increase of territory under the treaty of Berlin. This territory, at one time occupied by Servians, had been to a large extent deserted by them in consequence of the oppressive Turkish yoke, and their place had been taken by Mohammedan Albanians west of the Morava and by Bulgarians in the valley of the Nishava. Most of the Albanians, however, quitted their homes at the time of annexation, and Servians are now returning to their former seats. Previous to the treaty of Berlin the principal element of the population next after the Servians consisted of Roumanians, of whom there were about 130,000. The Servian Church forms a branch of the Oriental Greek Church with a perfectly independent administration. The highest ecclesiastical authority is exercised by the national synod. Elementary education is in a very backward state, but recently a law has been passed to remedy this defect, by making education obligatory on all children between six and thirteen and laying the duty of providing accommodation, books, and teachers upon school districts. At Belgrade there is a high school or university with faculties of philosophy, law, and technics.

Population.

The agricultural population are scattered among a great number of villages, most of which consist of single isolated homesteads. Each homestead is occupied by a group of families connected by blood and acknowledging one head, the *stareshina*, who is usually the patriarch of the community, but is often chosen by the rest of the members on account of his prudence and ability. He regulates the work and distributes the proceeds of the labor of the entire

homestead, and his ruling is followed without question. The land cultivated by a family or group of families is always their own property. The buildings belonging to the homesteads are enclosed within an immense palisade, inside which a large expanse of fields is mostly planted with plum, damson, and other fruit-trees, surrounding the houses of the occupiers. In the midst of these is the house of the stareshina, which contains the common kitchen, eating hall, and family hall of the entire homestead. In this last all the members assemble in the evening for conversation and amusement, the women spinning, while the children play. The people take delight in listening to the recitation of the poetical rhapsodies in which the Servian literature is remarkably rich. The houses are mostly very small wooden structures, serving for little else but sleeping places. But that of the stareshina is often of brick, and is invariably of better construction than the rest.

Government.

Since 6th March, 1882, the government has been a constitutional monarchy. The legislative body is called the *skupshtina*, and in 1884 consisted of 178 members, three-fourths of whom are elected by the people, the remainder being nominated by the king. A new skupshtina is elected every three years. For the settlement of special questions of great moment an extraordinary skupshtina or great national assembly is elected, in which there are four times as many members, all elected, as in the ordinary skupshtina. There is also a permanent council of state of 15 members, who have the task of drawing up proposals for legislation, hearing complaints regarding the decisions of ministers, and performing other functions. For administrative purposes the kingdom is divided into twenty-two circles, beside the city of Belgrade. In the budget for 1883–84 the revenue and expenditure were each estimated at nearly £1,500,000 [$7,290,000], and for 1884–85 at about £1,840,000 [$8,942,400]. The national debt at the end of 1884 was about £7,000,000 [$34,020,000]. An additional debt of about £1,000,000 [$4,860,000] was contracted during the Servo-Bulgarian war of 1885–86.

Army.

The Servian army is divided into three classes. The first class, embracing men between 25 and 30 years of age, constitutes the standing army, which numbers 18,000 on a peace footing and about 100,000 on a war footing. The first two years are served with the colors and the remainder of the term in the reserve. The second class contains men between 30 and 37 who have served in the standing army. The third class, which is only called out in extraordinary emergencies, is composed of men between 37 and 50. The total military strength of Servia for cases of emergency is estimated to be about 210,000 men.

The capital of Servia is Belgrade, at the junction of the Danube and the Save. It is the only town with more than 15,000 inhabitants. Next in size is Nish, in the territory added by the treaty of Berlin, where the valley of the Nishava opens into that of the Bulgarian Morava. The other chief towns are Kragushevatz in the centre of the Shumadia, the former capital of the country, Shabatz on the Save, Semendria on the Danube, Krushevatz, Alexinatz (the centre of the flax and hemp growing district), Ushitze, Posharevatz, Vranja, and Leskovatz.

See Rev. W. Denton, *Servia and the Servians*, London, 1862; Kanitz, *Serbien: historische-ethnographische Reisestudien*, Leipsic, 1868; Balme, *La Principauté de Serbie*, Paris, 1880. (G. G. C.)

History.

The original home of the Croats and Serbs, who are identical in race and language, was the country adjoining the Carpathian range. Their speech shows them to belong to the eastern division of the Slavonic family (see Slavs). The generally accepted derivation of the name *Chrobat, Croat*, is from the original designation of the Carpathians, *Chrbet*, "a ridge," an opinion supported by Schafarik and Professor Ljubić, author of a Croatian history. This view is rejected by Perwolf[1] and also by Penka,[2] but apparently on insufficient grounds. The last-named connects the word with the same root as that from which "Slav" is derived (*slu-ti, klu, kru*) and makes it signify the "vassals," those who follow a chief. The derivation suggested by Schafarik for "Serb" is the root *su*, "to produce;" thus the name would come to mean the people, just as *deutsch* is from *diot*, "people." He considers it to have been the original appellation of all the Slavs. This must be accepted as the best explanation hitherto given, though not altogether satisfactory. We find the name Σέρβοι in Ptolemy and *Sirbi* in Pliny.

The Serbs and Croats have no history till the year 638 A.D., at which period they left their original settlements and migrated into the ancient Illyricum and part of Mœsia. Whether any of this people had previously taken up their abode in the Balkan peninsula is by no means clear, and very different opinions have been held on the subject. The most probable account is that small Slavonic colonies were settled here and there as early as the 2d and 3d centuries, consisting mainly of prisoners taken in war; and we hear of two tribes, the Karpi and the Kostoboki, who are claimed by Schafarik with good reason as Slavs. Jireček considers that for two hundred years before the Slavs are heard of in history south of the Danube they were scattered as colonists in Mœsia, Thrace, Dardania, and Macedonia. Professor Drinoff finds mention of Slavonic colonies in Thrace in the *Itinerarium Hierosolymitanum* and *Itinerarium Antonini;* and, even if we do not give a complete adhesion to his views, there are many names of towns in Procopius (in the first half of the 6th century) which are undoubtedly Slavonic. The traces of the original inhabitants have disappeared, except in so far as the Albanians represent these peoples. It is generally believed that the word *meropch* or *neropch*, signifying a slave, found in the *Zakonik* of Dushan, refers to the Noropians, an old Thracian tribe.

Settlement of Serbs in Balkan peninsula.

Our authority for the Servian migration in the middle of the 7th century is the emperor Constantine Porphyrogenitus. According to the story, five Croatian princes, the brothers Clucas, Lobelus, Cosentzis, Muchlo, and Chrobatus, and two sisters, Tuga and Buga (*i.e.*, Calamity and Prosperity), came at this period from northern or Belo-Chrobatia, as it was called, the original home of the Croats in the Carpathian Mountains. The descendants of their people who remained in the territory are lost among the surrounding population. The services of these Croats were made use of by the emperor Heraclius, and they became a barrier against the Avars, whom they drove out of the country in which they settled. The territory which they occupied was divided by them into eleven *župas* or *gauen*. The people who inhabited the western portion kept the name of Croat, those in the eastern were called Serbs. We must now leave the Croats, as in this article we have only to do with the Serbs properly so called. The Croatian branch of the family, after being ruled by petty *bans*[3] (a word said to be of Avar origin), was annexed to the kingdom of Hungary, and after the 16th century followed the fortunes of the house of Hapsburg.

Early contests with Greeks.

For five centuries after their arrival in their new territories we hear nothing of the Serbs save an occasional very brief mention in the Byzantine chroniclers. The native annalists do not begin earlier than the 12th century. As in Croatia so among the Serbs, the smaller župans[4] gradually became merged into two or three great ones. The head župan of Servia, who resided in Desnica, called by Constantine Destinica, was at first the suzerain of all the other Servian župans, with the exception of the Pagani, concerning whose Latin name the emperor Constantine makes the very strange remark—*καὶ γὰρ Παγανοὶ κατὰ τὴν τῶν Σκλάβων γλῶσσαν ἀβάπτιστοι ἑρμηνεύονται.* After the land was harried by the Bulgarians we find the great župan of Dioclea (Doclea) supreme; he acquired the title of king, and received his insignia from the pope. Finally, Nemanya, the descendant of a župan family of Dioclea, founded a new dynasty in Rasa (mod. Novibazar), and united Servia and Bosnia into one strong empire. The names of the earlier princes, who are insignificant and do not help us to follow the thread of Servian history, need not be mentioned. We find them sometimes tributary to the Greek emperors and sometimes independent. They appear, moreover, to have been engaged in constant wars with the Bulgarians. About 1015 Vladimir was reigning; but he was assassinated by the Bulgarian czar John, who got possession of Servia, but died two years afterwards on an expedition against the Greeks. Together with Bulgaria, Servia fell under the power of the emperor, and its affairs were managed by a Greek governor. Stephen Voyislaff made an insurrection in 1040, expelled the governor, Theophilus Eroticus, and defeated the Greeks in 1043. His son and successor, Michael (1050–80), at first lived in peace with the Byzantines, but afterwards entered into diplomatic relations with the West, took the title of king (*rex*), and received his insignia from the pope (1078). He conquered Durazzo (Drać) in 1079, and reigned thirty years. His son, Constantine Bodin, subjugated the župans

[2] *Origines Ariacæ*, p. 128, Vienna, 1883.

[3] [Ban is a Persian word introduced by the Avars into Europe. See *New English Dictionary of the Philological Society*.—Am. Ed.]

[4] The following rules for the pronunciation of the Croatian letters will be found useful: *c* = *ts*; *ć* = a sound between *ts* and *ch*, something like *tie* in the English word "daintier;" *č* = *ch* as in "church;" *j* = *y* as in "yonng;" *š* = *sh*; *ž* = *zh* or *j* in the French "jour."

of Bosnia and Rasa. About 1122 Ourosh, surnamed Bela, župan of Rasa, ascended the throne. From this time dates the power of Servia. His wife Anna was a German princess. Omitting three insignificant rulers, we come to the famous Stephen Nemanya (1159–95), whose life has been written by his son Sava. He reigned thirty-six years, and was many times successful against the Greeks, but was not able to take Ragusa. He abandoned the government to his son Stephen in 1195 and became a monk under the name of Simeon, dying in 1200 in the monastery of Chilander on Mount Athos. Stephen was crowned by his youngest brother Sava, first archbishop of the country, with a crown which had been consecrated by the pope; hence his title *Prvovyenchani*, "the first-crowned,"—that is to say of the new dynasty, for the župans of Dioclea were already kings. He died in 1224 and was followed by his sons Radoslaff and Vladislaff in succession. The latter made an offensive and defensive alliance with Ragusa. He employed Germans to work the Servian mines; and we find them repeatedly mentioned in Servian documents under the name of Saxons, especially in the *Zakonik* of Stephen Dushan. No traces, however, can be found of them at the present day. Vladislaff's court is said to have been very luxurious. He died childless about 1237 and was succeeded by his brother Stephen Urosh, whose territories were devastated in 1241 by the Mongols. He was afterwards driven from his throne by his son Dragutin and died in 1272. The latter, however, stung by conscience, abandoned the crown to his brother Milutin and contented himself with Syrmia, where he died in 1317. The reign of Milutin was chiefly occupied with struggles against the Greeks; he was generally successful in his campaigns. But his domestic life was unhappy: he divorced three wives and caused his only son Stephen to be blinded from suspicion of his treachery. The operation, however, was imperfectly performed, and the youth recovered his sight. In 1314 Milutin fought on the side of the emperor Andronicus against the Turks, and in the same year forced the Ragusans to pay him tribute. After his brother Dragutin's death he seized his hereditary dominions, and recalling his son Stephen, whom he had banished to Constantinople, gave him Dioclea. In 1319 the Hungarians deprived him of Bosnia; two years later he died. His son Stephen was engaged in perpetual wars. In 1330 he defeated the Bulgarians at the brook Kamencha near Velbuzhd, when the Bulgarian czar Michael was slain. It was on this occasion that his son called Stephen Dushan first distinguished himself. In spite of the king's successes against the Greeks, he was destined to close his reign in the most lamentable manner: he was imprisoned and strangled by order of his own son at Zvechan in 1336. It is from this crime that Dushan gained his surname (*dushiti*, "to suffocate"). Concerning this prince, we are told by the ancient chroniclers that he was gigantic in stature and terrible in appearance. He conducted thirteen campaigns against the Greeks. In 1337 he took Strumitza and subjugated all Macedonia and Albania to Thessalonica, Kostur, and Janina, threatened Byzantium, and concluded a peace with the emperor Andronicus, who was shut up in Thessalonica. He now divided his kingdom into eight districts and arranged everything on the Byzantine model. He conquered the whole of Macedonia, and caused himself to be crowned emperor of Servia, his son Urosh as king (*kral*, *rex*), and the archbishop of the country as patriarch. In 1349, at a diet, he published his celebrated *Zakonik* or "Book of Laws" (see below). In 1356 he began a new campaign against the Greeks, his object being to seize Constantinople, to place the Greek crown upon his head, and drive the Turks out of Europe; but in the midst of his schemes he died at Deabolis in Albania on 18th December, 1356. His son Urosh was then but nineteen years of age, and, being sickly in body and weak in mind, he was unable to struggle against the revolted governors of his provinces, some of whom wished to make themselves independent. He was killed in a conflict with one of them in 1367, who ascended the throne under the name of Vukashin. This monarch was at first successful against the Turks, now already masters of considerable portions of the Byzantine empire; but he lost the decisive battle of Tænarus, and with it his life, in 1371. According to the chroniclers, the Serbs were surprised and many slain while sleeping. Many also were drowned in the waters of the Maritza, "and there their bones lay and were never buried." The fate of Vukashin and his brother Goiko was uncertain. The empire of Dushan now began to fall to pieces and Servia was again without a ruler. Marco, the son of Vukashin, declared himself the successor of his father; but the line was unpopular with the Serbs, and at a diet at Peć (Ipek) in 1374 they elected a young noble, Lazar Greblianovich, a connection of the old princely house. He did not, however, take the title of either emperor or king, but only of *knez* or prince. Bosnia was separated from Servia and fell under the rule of a noble named Tvertko. Sultan Murad had already conquered the Bulgarian sovereign Shishman and now marched against Servia. On the 15th of June, 1389, the Serbs were completely defeated at the battle of Kosovo, the "field of black-birds." No event has been so much celebrated in the national songs as this. Many are the lays which tell of the treachery of Vuk Brankovich and the glorious self-immolation of Milosh Obilich, who stabbed the conquerer on the battlefield. The silken shroud, embroidered with gold, with which his wife Militza covered the body of her husband is still preserved in the monastery of Vrdnik in Syrmia, and a tree which she planted is shown to travellers at Župa. According to one account Lazar was killed in the battle; according to others he was taken prisoner and executed before the eyes of the dying Murad. The bones of Lazar now rest at Ravanitza on the Frushka Gora in Syrmia. We hear no more of independent Serb princes; the country was now tributary to Turkey, and its rulers were styled despots. Stephen, the son of Lazar, was confirmed in this title by Bajazid, the successor of Murad. Militza died in a convent in 1406. Stephen died in 1427 childless, and was succeeded by George Brankovich, a man sixty years of age, whose reign was a troubled one. In 1437 he was compelled to fly to Hungary to avoid the wrath of Murad II., and did not recover his territory till Hunyadi and Scanderbeg drove back the Turks in 1444. George fell, in the ninety-first year of his age, in battle with a Hungarian magnate named Michael Szilagyi on 24th December, 1457. His youngest son Lazar succeeded him after committing many crimes, but only survived his father five weeks. His widow, Helena Palæologus, gave the country to the pope in order to secure his assistance against the Turks. Upon this the sultan ravaged Servia in the most pitiless manner, burnt the churches and monasteries, and carried off 200,000 persons into captivity. Servia became in all respects a Turkish province, although we occasionally find the empty title of "despot" borne by some of the descendants of its princes. Great numbers of the Serbs subsequently migrated to Hungary. In 1689 some thousands under the command of the despot George Brankovich entered the imperial (German) army. In 1691 the Servian patriarch, Arsenius Chernoyevich, led about 36,000 families to settle in various parts of Hungary, chiefly in Syrmia and Slavonia. These *zadrugas*, as they are called, are not families in our sense of the word, consisting of parents and children, but communities of families according to the custom still found among the Croats of the Military Frontier. The number of the emigrants at that time would probably amount to 400,000 or 500,000 persons. Others followed them in 1738 and 1788. These Serbs have kept their religion and language in spite of the desperate efforts of the Government to Magyarize them. The last despot of Servia was George Brankovich, who died in captivity in Austria in 1711.

Stephen Dushan.

Contests with Turks.

Battle of Kosovo.

Servia tributary to Turkey.

In consequence of the splendid victories of Prince Eugene, Austria acquired the greater part of Servia by the treaty of Posharevatz in 1718, but the Turks regained it by the peace of Belgrade in 1739. For upwards of four centuries the Serbs groaned under the Turkish yoke, until, in 1804, unable to endure the oppression of the Turkish *dahis*, they broke out into rebellion under George Petrovich, surnamed *Tsrni*, or "Black George" (in Turkish *Kara*). Kara George was born at Topola (Tapolja) in 1767; at first he merely aimed at conquering the dahis, but afterwards he attempted to drive the Turks out of Servia. This he succeeded in doing after many failures. In 1813, however, they reconquered the country, and George with his adherents was compelled to fly to Austria. He returned in 1817, but was treacherously murdered by order of Milosh Obrenovich, who had now become the Servian leader. We have no space here to sketch the struggles of Milosh to secure the independence of Servia. He was himself of peasant origin and in his youth had been a swineherd. The Turks had contrived to kill or drive out of the country all the Servian aristocracy, leaving only peasants to till the ground, feed swine (one of the great industries of the country), and pay the *harach*. Milosh was declared prince by the national assembly, and in 1830 secured the consent of the Porte to his enjoyment of the title with the succession reserved to his family. Turkey allowed Servia a quasi-independence, but held and garrisoned several fortresses. Milosh had so little forgotten his Turkish training that he made himself obnoxious to his subjects by his despotic acts. He was a man of simple, even coarse habits, as many of the anecdotes told of him testify. He was compelled to abdicate in 1839 in favor of his son Milan, who, however, was of too feeble a constitution to

Struggles for independence.

direct the government, and, dying soon afterwards, was succeeded by his younger brother Michael. He also abdicated in 1842 and the Serbs then elected Alexander, the son of Tsrni George, or, to give him his Servian patronymic, Karageorgevich. His rule lasted seventeen years; he was compelled to resign in 1859, and Milosh, now very old, was invited to come from Bucharest. He lived, however, only one year, dying in 1860, and left the throne to his son Michael, then aged forty, who was thus a second time elected prince of Servia. Michael was a man of refinement and had learned much during his exile. The condition of the country improved during his reign, and in 1862 he succeeded in getting the Turkish garrisons removed from Belgrade. The Moslem inhabitants have gradually withdrawn from the country, so that they are now represented by a very few families. Of the two mosques still remaining in Belgrade, one is devoted to their use, the other having been turned into a gas-work. While walking in his park, called Koshutniak or Topshidere, near Belgrade, Michael was assassinated by the emissaries of Alexander Karageorgevich on 10th June, 1868. He was succeeded by his second cousin, Milan, grandson of Yephrem, a brother of Milosh. Milan was born in 1854; he became prince of Servia in 1872. In 1875 he married a Russian lady, Natalie de Keczko. In 1878 the Serbs declared war against Turkey, but their arms were unsuccessful, and they were only saved by the intervention of Russia. By the treaty of Berlin, July, 1878, the country received a large accession of territory, and the prince caused himself to be proclaimed king. Peace continued till the year 1885, and during this period the Serbs seemed to make considerable progress as a nation, in spite of the bitterness of political faction. In 1885, however, Servia made an ill-judged and selfish attack upon Bulgaria, which was ignominiously beaten off.

Literature.

For some account of the Servian language, see Slavs.

Under Servian literature the Dalmatian and Croatian in the limited sense of the term must be included. The latter, however, is somewhat meagre. This literature is divided into three periods—(1) from the earliest times to the fall of Servian independence at the battle of Kosovo, 1389; (2) from the rise of the importance of Ragusa in the 15th century till its decay towards the end of the 17th; (3) from the time of Dositei Obradovich to the present day.

First Period.—The earliest composition which has come down to us in the Servian or Illyrian language, to use a term in which we may include the Dalmatian Slavs, who are essentially the same people, is the production of an unknown priest of Dioclea (Doclea), now Duklya, a heap of ruins, but formerly a city of considerable importance on the river Moratza. His title in Latin is "Anonymus Presbyter Diocleus," or in Slavonic "Pop Dukljanin." He must have lived about the middle of the 12th century, as the chronicle compiled by him extends to the year 1161. It is a tedious production, and possesses only antiquarian interest; it is printed by Kukuljević Sakcinski[1] in the *Arkiv za Povestnicu Jugoslavenskn* (Agram, 1851). The oldest documents of the Servian language in the narrower sense of the term are a letter of Kulin, the ban of Bosnia in 1189, and the letter of Simeon or Stephen Nemanya to the monastery of Chilander on Mount Athos. These productions are simply Palæoslavonic with a mixture of Serbisms. The history of early Servian literature has been thoroughly investigated by Schafarik in his *Serbische Lesekörner* (Pesth, 1853). We have only space to mention the more important productions. (1) The *Life of St. Simeon* by his son St. Sabbas or Sava, the first archbishop of Servia, was written about 1210. The early manuscripts have been lost and the oldest copy known only dates from the 17th century. Besides this work, Sava also compiled a *tipik* or collection of statutes for the monastery of Studenitza, of which he was hegoumen or abbot. He was the founder of the celebrated Chilander monastery. (2) The *History of St. Simeon and St. Sabbas* by Dometian was compiled in 1264, and is preserved in a manuscript of the 14th century. There is a good edition by Danichich, to whom we are indebted for a valuable lexicon of Old Servian. (3) The *Rodosloff* or Lives of Servian kings and archbishops, compiled by Archbishop Daniel (died 1338), contains the lives of Kings Radoslaff, Vladislaff, Urosh, Dragutin, Queen Helena, Milutin, etc. After his death the work was continued by an anonymous writer. The style of these productions is dry and tasteless. They are written in Palæoslavonic mixed with Serbisms. Hilferding has commented with great severity on their bombastic and panegyrical style,—the most complimentary epithets being applied to many sovereigns whose careers were stained with crimes. (4) The *Life of Stephen*, surnamed "Dechanski," from the monastery Dechani which he founded, written by Gregory Tzamblak, hegoumen of the same monastery. (5) In 1359 we have the Code of Laws (*Zakonik*) of Stephen Dushan, which has been previously mentioned; it is the earliest specimen of Servian legislation, and has come down in several manuscripts, being first published by Raich in his *History* at the close of the 18th century. Since that time other editions have appeared, the two most important being those of Miklosich and Novakovich.

Second Period.—To this epoch, which may be said to commence with the 15th century, belong some of the Servian chronicles, the *Lyetopis Koprivnichki* and others,—dry and tedious compilations; the 15th century saw also the outburst of the literature of Ragusa (see below). The Servian ballads have obtained a European celebrity, and must have existed from very early times. Nicephorus Gregoras, who in 1325–26 came to Stephen Urosh IV. as ambassador from the Byzantine emperor Andronicus, noticed that some Serbs attached to his suite sang tragic songs celebrating the great exploits of their national heroes. As M. Pipin remarks in his *History of Slavonic Literature*, this shows the existence of a national epic among the Serbs before the battle of Kosovo. In the description of an embassy sent from Vienna to Constantinople in 1551 a certain Kuripeshich, by birth a Slovene, speaks of hearing songs sung in honor of Milosh who slew Sultan Murad. The first attempt at collecting them was made by the Franciscan monk Andrew Kačić-Miošić, a Dalmatian, who died in 1785. His work was published at Venice in 1756 under the title of *Razgovor Ugodni Naroda Slovinskoga* (Recreations of the Slavonic People). Some of the pieces included in this volume were written by Miošić himself, and he made many alterations in the old ones. This, however, was quite in the spirit of the age in which he lived. We find extracts from Servian ballads in some of the Dalmatian poets of the 16th century. In 1794 they were alluded to in the *Travels* of the abbé Fortis, and were finally collected by Vuk Stephanovich Karajich and published at Leipsic in 1824 under the title *Narodne Srpske Pyesme* (Popular Servian Songs). Some of them were afterwards translated into German by Theresa von Jacob and into English by Bowring and Lord Lytton. The versions of the last two possess but little merit. It would be impossible in a short notice like the present to discuss the contents of these remarkable ballads. To the majority of readers the cycle which treats of Knez Lazar and his fate at the battle of Kosovo will prove the most interesting. Besides historical persons introduced in the ballads, there is the half-mythical hero Marco Kralevich, who, like the Russian Ilya Murometz, has many of the characteristics of a supernatural being. His victories, chiefly over Turks and Magyars, are narrated in the most bombastic phraseology. At last he dies in battle; but the belief prevails that he remains concealed till he shall appear on some future occasion to rescue his people from their oppressors. Almost as mysterious as the hero himself is his horse Sharatz, who was presented to him by a *vila* or fairy. After the death of Vuk Stephanovich (1864) a supplementary volume was published by his widow, which her husband had left prepared for the press, *Srpske Narodne Pyesme iz Herzegorine* (Popular Servian Songs from Herzegovina, Vienna, 1866). A good collection of songs of the Montenegrins (Tsrnogortzi) was edited at Leipsic in 1857 by Milutinovich. There has also appeared a little volume of Servian national songs from Bosnia, collected by Bogolub Petranovich in 1867. Since then volumes of Servian popular poetry by Rayachevich and Ristich have appeared.

Early chronicles.

Servian ballads.

During this period Slavonic literature reached a high pitch of culture in the little city of Ragusa, called in Slavonic Dubrovnik. During the 15th, 16th, and 17th centuries this city, now in a state of decay, was a kind of Slavonic Athens. To the influence of Italian literature was added the culture introduced by the crowds of learned Greeks, Chalcocondylas, Lascaris, and others,—who found refuge within its walls after the fall of Constantinople. Lyrics and the lyric drama seem to have been the general productions of the more noteworthy authors. The influence of Italian is perceptible throughout. The first writer of eminence was Hannibal Lucić, a very popular poet in his day, author of love-songs, a drama *Robinja* (The Female Slave), and translations published first by his son Anthony at Venice in 1556, and reprinted by Dr. Gaj at Agram in 1847. A very interesting poem by this author is his *Eulogy* of the city of Dubrovnik (Ragusa). Another writer of considerable reputation was Nicholas Vetranić-Čavčić (1482–1576), who afterwards became a monk and lived as a hermit on one of the islands on the Dalmatian coast. He has left several

Ragusan era.

[1] In citing the names of those members of the Servo-Croatian race who use Latin letters the original orthography is preserved

plays and, besides translating the *Hecuba* of Euripides, wrote several mysteries, in the style of the religious plays once so popular throughout Europe; of these the *Sacrifice of Abraham* is the best. His poem entitled *Italy* is remarkable for the warm affection it expresses for the country of his education. Peter Hektorević (1486–1572) was a rich proprietor of the island of Zara, and is worth mentioning as having shown a taste for the national poetry of his country. He has introduced some songs in his *Ribanje i Ribarsko Prigovoranje* (Fishing and a Dialogue of Fishermen). Very celebrated in its time was the *Jegjupka* or Gypsy of Andrew Čubranović (1500–1559), who was originally a silversmith. His poem of the *Gypsy* is said to have been evoked in the following manner. Čubranović was on one occasion following a young lady and urging his suit when she turned round and said scornfully in Italian to her attendant, in the hearing of the poet, "Che vuole da me questo Zingaro?" ("What does this Gypsy want with me?"). The despised lover took up the word of reproach and wrote a poem in which he introduced a Gypsy prophesying to a company of ladies their various fortunes and concluding with an expostulation to the hard-hearted beauty for her obduracy. Schafarik speaks of this piece with great enthusiasm and calls it "a truly splendid flower in the garden of the Illyrian Muses." The Russian critic Pîpin supposes, with great probability, that the poem was written as a sort of masquerade for the carnival. It enjoyed considerable popularity and was frequently imitated. A similar story is said to have suggested the *Dervise* (Dervish) of Stjepo Gučetić, in which the author represents himself as a Turkish dervish. These two pieces are elegant productions in the Italian manner.

Nicholas Naljeskovic (1510–1587) was a native of Ragusa and author of several pastoral plays in the style then so much in vogue throughout Europe. Of the same description are the productions of Marino Držić (1520–1580, of whom his contemporaries praised "il puro, vago, e dolce canto." Mention may also be made of Dinko Ranjina and Mauro Orbini (d. 1614). Another celebrated poet was Dominco Zlatarić (1556–1607), who, besides translating the *Electra* of Sophocles, produced a version of the *Aminta* of Tasso and has left several minor pieces. The chief of the Ragusan poets, however, was Ivan Gundulić (sometimes called by his Italian name of Gondola). Very few facts are known of his life; but he died in 1658, aged fifty, having discharged several important public offices. His death, says Schafarik, was not too early for his fame but too early for literature and the glory and prosperity of his country. He himself published but little, and many of his writings perished in the earthquake in 1667, after which Ragusa never regained her former prosperity. The so-called Petrarchan school of Illyrian poetry languished after this and wasted its energy on elegant trifles. Dalmatian poets of the 18th and 19th centuries have not made any considerable figure. The *Osman* of Gundulić, on which his fame rests, is an epic in twelve books, and was written to celebrate the victory of the Poles under Chodkiewicz over the Turks and Tatars in 1622 at Chocim (Khotin). Schafarik praises Gundulic for the richness of his imagination, the lofty tone of his verse, and its perfectly constructed rhythm. We are willing to allow that *Osman* possesses considerable spirit and that the versification is melodious, but on the whole it seems a tedious poem. The short quatrains in which it is written lack the true epic dignity. Leaving the Dalmatians, the only writer worthy of mention among the Serbs is George Brankovich (1645–1711), the last despot, who compiled a *History of Servia till the end of the 17th Century*, which has been edited by Chedomil Miyatovich, ambassador from the court of Servia to St. James's (1886). From this period till the close of the 18th century there is no Servian literature: the spirit of the people seems to have been crushed out of them by Austrian persecutors on the one hand and by Turkish on the other. Till the reign of Milosh Obrenovich in the 19th century hardly a Servian printed book was to be seen. The works of Yuri Krizhanich, who, although a Serb, wrote in Russian, are mentioned under RUSSIA (p. 105).

Third Period (from 1750).—The spark of nationality was still burning among the Serbs, in spite of their degradation, and men were found to fan it. Such a man was Raich (1720–1801), a thorough patriot. He was born in Slavonia, a province of Austria inhabited by Serbs, the son of poor parents, but he had all the enthusiasm for learning that animated the Russian Lomonosoff, whom he very much resembled. Thus we find him making his way on foot from his native town to Kieff, where he was received into the ecclesiastical seminary and devoted himself to theology. After spending three years at Kieff, he betook himself to Moscow. Meeting, on his return to his native country, with a cold reception from those whom he had expected to foster his studies, he went back to Russia, and while at Kieff resolved to write the history of the Servian nation. Knowing that the Slavonic monasteries in European Turkey contained many unpublished manuscripts (numbers of which have since perished in the wars which have devastated the country or have been destroyed by the Greeks), he visited Constantinople and many other parts of that empire in order to collect materials. On his return to Austria he took up his abode at Neusatz on the Danube (also long the headquarters of Schafarik), and worked at his history, which he finished in 1768, but it was not published till upwards of twenty years later. In 1772 he became a monk, and he died in 1801. The work of Raich, though interesting as a monument of learned industry, does not now possess much critical value. The style is harsh and a great deal of the ethnology (a science then in its infancy) unsound. Thus, among other strange statements, he holds the Bulgarians on the Volga to have been Slavs. After Raich we come upon two indefatigable Servian workers, Dositei Obradovich (1739–1811) and Vuk Stephanovich (1787–1864). Obradovich. The life of the former has been written by himself. He was a man of varied learning, and his career was marked by many curious adventures. After having visited nearly every part of Europe (including England, where he was received with great hospitality),[1] Obradovich returned to Servia and became tutor to the children of Tsrni George. He was a man sprung from the people, and an indefatigable and successful laborer for national education. The list of his compilations and translations is considerable. Acting on the wise principle that the language *as it is spoken* should be cultivated and not a jargon overloaded with archaic and supposed classical forms, he did good by destroying the influence of the Palæoslavonic among his countrymen. Before his death his services to his country were recognized by his appointment as member of the senate and superintendent of national education. The man, however, who was destined to bring the Servian language into the greatest prominence was Vuk (Wolf) Stephanovich Karajich, whose collection of songs was mentioned above. Vuk was an indefatigable scholar and patriot. Till his time the Servian language had been, so far as all foreigners were concerned, simply *rudis indigestaque moles*. He wrote a good grammar, which has formed the basis of all published since, and to this Jacob Grimm furnished a preface. To him also we owe a Servian dictionary and a collection of tales and proverbs. His supposed innovations in the Servian language with regard to the rejection of archaisms and the introduction of a new system of orthography raised up a host of enemies against him, so that not only was he forbidden to enter Servia but his books were excluded from the country. He died at the beginning of 1864, but permission to make use of his innovations was not given till four years afterwards.

Raich. Vuk Stephanovich.

A complete enumeration of the Servian and Croatian authors of the 19th century would far exceed the limits of this article. But Matthias Anthony Relković (1732–1798) deserves mention, because he wrote in a dialect but little cultivated, viz., the Slavonian in the restricted sense, as applied to the Austrian province of that name. He published in 1761 a successful satire entitled *Satir iliti Divi Csovik* (Satire or the Clever man), at Dresden. A few names, each of which marks a definite feature of the literature, must suffice. Lucian Mushitzki (1777–1851), an archimandrite, afterwards bishop of Carlowitz, was highly esteemed by his countrymen as a poet. His odes are full of patriotic feeling. Yovan Hadchich (1799–1870) wrote under the *nom de plume* of Milosh Svetich. For some time he was an authority in Servian literature, but ultimately his influence waned. Simeon Milutinovich, a noted writer, whose life was full of strange adventures, composed an epic poem entitled *Serbianka*, which describes the chief incidents of the Servian war in 1812. It was published at Leipsic in 1826. We have previously alluded to his collection of Montenegrin songs. He is also the author of a tragedy on Milosh Obilich, who slew Sultan Murad. Milutinovich, who was a Bosnian, died in poverty in 1847. Yovan Popovich (1806–1856), a native of the Banat, was a writer of much industry and merit, and gained a considerable reputation by his plays, the subjects of which were taken from Servian history and were put upon the stage with considerable effect. Without being a great dramatic writer, he had the art of constructing pieces to which people would listen,—something like Sheridan Knowles. To this circle belongs also

Minor writers.

[1] To show the opinion entertained of him in Britain it is only necessary to cite the inscription in a book presented to him by Dr. Fordyce, an eminent London physician of the time: "Dositheo Obradovic, Serbiano, viro linguis variis erudito, sanctissimis moribus morato," etc.

Yuri Maletich, author of *Spomenik Lukianom Mushitzkom* (A Memorial to Lucian Mushitzki), and also the *Apotheosis of Kara George*. In 1847 the well-known journal *Glasnik* (The Messenger) was founded, which has continued to the present time and contains many valuable papers on Servian history and literature. Schafarik had previously founded at Neusatz (Novi Sad) the *Matitza Srbska*, an excellent society for printing Servian books.

Croatian literature.

The Croats have also been active in modern times. The remarkable poem, *Death of the Agha Ismail Čengić*, by Ivan Mažuranić (born in 1813), is said to be so popular among the Serbs, as stimulating their hatred of the Turk, that it has been called "The Epos of Hate." Ismail was the descendant of an old Bosnian family who had turned Mussulmans to keep their estates when the country was first invaded. These renegades, as might be expected, are more fanatical than the Turks themselves. His exploits were chiefly directed against the Uskoks and the Montenegrins. The poem is composed in the same metre as that of the Servian ballads collected by Vuk. It is spirited, but has a savage air about it, engendered by the scenes described, the fierce border wars of long hereditary hatred. The account of the cruelties committed by the Turks while collecting the *harach* and the conclusion, where the body of the slain Agha is brought to the hermit, are dramatically conceived.

Servo-Croatian poetry.

The four most celebrated Servo-Croatian poets are Stanko Vraz, Preradović, Yovanovich, and Radichevich. Stanko Vraz (1810–1851) was by birth a Slovene; he joined, however, the Illyrian movement under Ljudevit Gaj and used the Servo-Croatian language. The attempt of Gaj to form a common literary language under the name of Illyrian by fusing the Servo-Croat and the Slovenish languages was not successful. Perhaps the only result, if it had been preserved in, would have been that the Slovens would have become completely Germanized, as a pedantic literary language would not have been understood by the peasants. Besides many graceful lyrics, Vraz also published collections of national songs. Some of his shorter pieces are very elegant and have a rich Oriental coloring. Peter Preradović (1818–1872), a native of the Military Frontier and a general in the Austrian army, is the author of many graceful lyrics, widely known throughout all Servian-speaking regions. A complete edition of his works appeared in 1873. Peter Yovanovich (born in 1801) is the author of many popular poems. But no one of the later generations of Servian authors has gained such a reputation as Branko Radichevich, who was born in the Austrian Banat in 1824, and ended his short life at Vienna in 1853. His popularity rests upon the patriotism shown in his writings and their spirited tone. Nor have the Servo-Croats lacked important workers in the fields of history and philology. Among these must be mentioned Dyuro Danichich (1825–1882), who was educated partly at Pesth and partly at Vienna, at the latter university becoming a pupil of Miklosich. He first made himself conspicuous by espousing the cause of Vuk Stephanovich Karajich in the dispute about Servian orthography. Besides contributing valuable papers to the *Glasnik*, he was the author of an Old Servian dictionary of great service to students. He edited, as previously mentioned, the memorials of Old Servian literature. At the time of his death he was engaged upon a great Servo-Croatian dictionary, a work which it is to be hoped, will be continued by some of his pupils. Ljudevit Gaj (1809-1872), who has already been mentioned, was a Croat and labored to bring about a national unity. His services were invaluable as an editor of the Old Dalmatian classics. Armin Pavić (still living) has written a good history of the Dalmatian drama (*Historija Dubrovačke Drame*, Agram, 1871). Stoyan Novakovich (born 1842), at one time minister of public instruction, besides contributing valuable articles in the *Glasnik*, has published an historical chrestomathy of the Servian language and an edition of the *Zakonik* of Stephen Dushan. Another worker in the same field was Chedomil Miyatovich, previously mentioned. One of the most indefatigable and patriotic of modern Croatian scholars is Ivan Kukuljević Sakcinski, who has edited, besides many early Croatian and Servian works, an admirable *Arkiv az Povestnicu Jugoslavensku* Collection of Documents for South Slavonic History), of which several volumes have appeared, —a veritable storehouse of Slavonic history, archæology, and literature. He has found an excellent coadjutor in Dr. Francis Rački (born 1829), among whose works may be mentioned *Pismo Slavjensko* Slavonic Writing, Agram, 1861), *Odlomci iz Državnoga prava Horvatskoga* (Fragments of Croatian Law, 1861), and many excellent historical articles in the journals *Pozor* (The Observer) and *Rad* (Labor).

After Miklosich, the most indefatigable worker in the field of Slavonic literature now living is the Croat Ignaz Vatroslaff Jagić (born 1835), formerly a professor at Berlin, who now occupies the chair of Slavonic philosophy at St. Petersburg, in the place of Sreznevski. He has published many valuable works on Slavonic philology, such as (in 1867) a *History of Servo-Croatian Literature*, also a reading-book with specimens of early Glagolitic and Cyrillic works (*Primĕri Staroherватskoga Jezika*). He has also edited two of the oldest Slavonic codices, Marianus and Zographensis. Moreover, in 1875, he founded the well-known *Archiv für slavische Philologie*, which he still edits with the coöperation of many Slavists. Sime Ljubić is another worker in the field of Slavonic history and literature. To the excellent literary journals already mentioned may be added the *Starina*, published at Agram. Valuable works have been written by Balthasar Bogišvić on the house-communities of the southern Slavs and south Slavonic law generally. His labors have been made use of by Sir Henry Maine. One of the most celebrated of living Servian poets is Matthias Ban, the author of several poems and plays, which have been very favorably received.

Slavonic literature generally.

A few words may be added here on Montenegrin history and literature, the details of which are but scanty. On the death of Stephen Dushan, a certain prince Balsha became independent ruler of Zeta. Many fugitives betook themselves to the little retreat after the battle of Kosovo. Ivan Chernoyevich settled in Tzetinye (Cettinje) in 1485 and built a church and a monastery. In 1516 his son and successor retired to Venice, and Montenegro was governed by a national assembly and a vladika (prince bishop). The country was ruled by vladikas of various families till 1697. In that year the office became hereditary in the family of Petrovich of Negosh. Originally the ecclesiastical and civil functions were combined in the person of the vladika, but they were separated on the death of Peter II. in 1851. The latter was the author of some poems in the Servian language, the most celebrated being *Loucha Mikrokozma* (The Light of the Microcosm), which appeared at Belgrade in 1845. He was succeeded by his son Daniel, first prince of Montenegro, who, dying in 1860, was followed by his nephew Nicholas, the most memorable events of whose reign have been the war with Turkey and the increase of his territory by the treaty of Berlin. (W. R. M.)

Monte-negro.

SERVITES (Servi Beatæ Mariæ Virginis). This religious order owes its origin to Bonfiglio Monaldi, a Florentine, who in 1233[1] withdrew along with six of his comrades to the Campo Marzo near the city for prayer and ascetic exercises in honor of the Virgin. Three years afterwards they removed to Monte Senario, where their numbers were considerably increased. The order at a very early period received from Bishop Ardingus of Florence the rule of St. Augustine, but did not obtain papal sanction until 1255. It rapidly spread into France, Germany, the Low Countries, Poland, and Hungary, and from Martin V. it received in 1424 the privileges of the mendicant orders. The Servite Tertiaries were founded about the same time by Giuliano Falconieri. Under Bernardino de Ricciolini arose the Hermit Servites (1593). The members of the order (Observants and Conventuals) are now found chiefly in Italy, Hungary, Austria, and Bavaria.

SERVIUS, the commentator on Virgil, is all but unknown to us, so far as personal information goes. From notices in the *Saturnalia* of Macrobius, where he appears as an interlocutor, we may infer that in or about 380, though still quite young, he was already distinguished as a "grammaticus," that is, as an expert in the criticism, explanation, and teaching of the classical literature of Rome. Servius therefore belongs to the latter half of the 4th and the earlier years of the 5th century, to the age of Symmachus and Claudian, of Jerome and Augustine. The allusions of Macrobius and a short letter from Symmachus to Servius leave no doubt that the grammarian formed one of that band of cultivated men, led by Symmachus, whose eyes were turned towards the pagan past and away from the Christian future, and who breathed into pagan culture its last transient sparks of life and vigor. The race of "grammatici" to which Servius belonged, and which had now run at Rome a course

[1] [Date 1223, in vol. xvi. p. 742, is preferable.—Am. Ed.]

of some 500 years, had done much evil to literature, had helped to corrupt, falsify, encumber, and even in some instances by abbreviations upon abbreviations to kill out the texts on which they worked; but on the whole they had done more good. They had helped to save what could be saved of education, culture, and history, and so had in the main contributed to the preservation of the ancient literature that has come down to us. Of all the "grammatici" none bears on his front more of the virtues and fewer of the vices of the race than Servius. But it must be noted that much which passes under the name of Servius in modern editions, and in modern quotations, most certainly did not proceed from his hand. The comments on Virgil to which his name has been attached come from three different sources. One class of MSS. contains a comparatively short commentary, definitely attributed to Servius. A second class (all going back to the 10th or 11th century) presents a much expanded commentary, in which the first is embedded; but these MSS. differ very much in the amount and character of the additions they make to the original, and none of them bear the name of Servius. The added matter is undoubtedly ancient, dating from a time but little removed from that of Servius, and is founded to a large extent on historical and antiquarian literature which is now lost. The third class of MSS., written for the most part in Italy and of later date, repeats the text of the first class, with numerous interpolated scholia of quite recent origin and little or no value.

The real Servian commentary (for so we must designate the text that we find in the first class of MSS.) practically gives the only complete extant edition of a classic author written before the destruction of the empire. It is constructed very much on the principle of a modern edition, but with very different ideas both as to the relative and the absolute value of the matters treated. Owing to the delicacy and originality of his veiled style, to the innumerable threads of ancient history, mythology, and antiquities shot through the texture of his poems, owing above all to the firm hold he early gained upon the Latin schools, Virgil had a continuous line of expounders stretching almost from his death to the destruction of the Roman government of the West. Servius built his edition in part on the extensive Virgilian literature of preceding times, much of which is known only from the fragments and facts he has preserved. The notices of Virgil's text, though seldom or never authoritative in face of the existing MSS., which go back to, or even beyond, the times of Servius, yet supply valuable information concerning the ancient recensions and textual criticism of Virgil. In the grammatical interpretation of his author's language, Servius does not rise above the stiff and overwrought subtleties of that day; while his etymologies, as is natural, violate every law of sound and sense. As a literary critic the shortcomings of Servius are great, if we judge him by a modern standard, but he shines if compared with his contemporaries. In particular, he deserves credit for setting his face against the prevalent allegorical methods of exposition. But the abiding value of his work lies in his preservation of facts in Roman history, religion, antiquities, and language which but for him might have perished. Not a little of the laborious erudition of Varro and other ancient scholars, to whom time has proved unkind, has survived in Servius's pages. The older MSS. sometimes add to the name Servius that of Magister (given to other distinguished grammarians at different times); the later Italian MSS. in some cases give his name as Maurus Servius Honoratus. Besides the Virgilian commentary, we have other works of Servius,—a collection of notes on the grammar (*Ars*) of Donatus; a treatise on metrical endings; the tract *De Centum Meteris* or *Centimeter*.

The most noted editions of the Virgilian commentary are by Fabricius (1551); P. Daniel, who first published the enlarged commentary (1600); and by Thilo and Hagen (Leipsic, 1878–84). The *Essai sur Servius* by E. Thomas (Paris, 1880) is an elaborate and valuable examination of all matters connected with Servius; many points are treated also by Ribbeck in his "Prolegomena" to Virgil, and by Thilo and Hagen as above. The smaller works of Servius are printed in Keil's *Grammatici Latini*.

SERVIUS TULLIUS, the sixth king of Rome, described in one account as originally a slave, is said to have married a daughter of Tarquin, and to have gained the throne by the contrivance of Tanaquil, his mother-in-law. Another legend represented him as a soldier of fortune originally named Mastarna, from Etruria, who attached himself to Cæles Vibenna, the founder of an Etruscan city on the Cælian Hill. Servius included within one circuit the five separately fortified hills which were then inhabited and added two more, thus completing the "Septimontium"; the space thus inclosed he divided into four "regiones," the Suburana, Esquilina, Collina, and Palatina (see ROME, vol. xx. p. 831). For his contributions to Roman law see ROMAN LAW, vol. xx. p. 690 *sq.*, and for his reforms of the constitution see ROME, vol. xx. pp. 753–4. His legislation was extremely distasteful to the patrician order, and his reign of forty-four years was brought to a close by a conspiracy headed by his son in-law Tarquinius Superbus. The street in which Tullia drove her car over her father's body ever after bore the name of the "Vicus Sceleratus."

SESAME, the most important plant of the genus *Sesamum* (nat. ord. *Pedalineæ*), is that which is used throughout India and other tropical countries for the sake of the oil expressed from its seed. *S. indicum* is an herb 2 to 4 feet high, with the lower leaves on long stalks, broad, coarsely toothed or lobed. The upper leaves are opposite, lanceolate, and bear in their axils curved, tubular, two-lipped flowers, each about ¾ inch long, and pinkish or yellowish in color. The four stamens are of unequal length, with a trace of a fifth stamen, and the two-celled ovary ripens into a two-valved pod with numerous seeds. The plant has been cultivated in the tropics from time immemorial, and is supposed on philological grounds to have been disseminated from the islands of the Indian Archipelago, but at present it is not known with certainty in a wild state. The plant varies in the color of the flower, and especially in that of the seeds, which range from light yellow or whitish to black. Sesame oil, otherwise known as gingelly or til (not to be confounded with that derived from *Guizotia oleifera*, known under the same vernacular name), is very largely used for the same purposes as olive oil, and, although less widely known by name, is commercially a much more important oil; thus, apart from the almost universal use of the oil in India, from 50 to 80 millions of kilogrammes [*c.* 50,000–79,000 tons] of the seed are stated to have been introduced annually into France in 1870–72. The seed is also largely exported from Zanzibar and Formosa. The seeds and leaves also are used by the natives as demulcents and for other medicinal purposes. The soot obtained in burning the oil is said to constitute one of the ingredients in India or Chinese ink. The plant might be cultivated with advantage in almost all the tropical and semi-tropical colonies of Britain, but will not succeed in any part of Europe.

SESOSTRIS (Σέσωστρις, so Herodotus; Diodorus writes *Sesoosis;* other forms are *Sesonchosis*, *Sesosis*, *Sesothis*, etc.) is according to Greek historians the name of a king of Egypt who conquered the whole world, even Scythia, the lands of the Ganges, and Æthiopia, which were not subject to any of the later great empires. The conqueror in whose exploits these extravagant legends took their rise was Ramses II. (see EGYPT, vol. vii. pp. 640–1); but the Greek accounts unite in his person all the greatest deeds of the ancient Pharaohs, and add much that is purely imaginary. In Manetho's lists Sesostris is identified

with a much older king, Usertesen II., perhaps because authentic tradition made him the conqueror of Æthiopia (see vol. vii. p. 637). When Herodotus says that he himself saw monuments of Sesostris in Palestine, he has been thought to refer to the figures of Ramses II. hewn in the rocks of Nahr-al-Kalb, near Beirút, but they do not agree well with his description (Hdt., ii. 102–106), which seems to point rather to Astarte pillars (*Asherim*). The monuments in Ionia of which he speaks still exist in the Karabel Pass. They are not Egyptian but so-called "Hittite," *i.e.*, probably Cappadocian. See Wright, *Empire of the Hittites*, last plate.

SESSA, a town of the kingdom of Italy, province of Terra di Lavoro, situated among hills on the site of the ancient *Suessa Aurunca*, on a small affluent of the Garigliano, is 17 miles east of Gaeta and half a mile from Sant' Agata. The hill on which Sessa is situated is a mass of volcanic tufa, in which have been discovered painted chambers erroneously supposed to have belonged to a city covered by a volcanic eruption. The town contains many ancient remains, particularly the ruins of Ponte Aurunca and of an amphitheatre. It is the see of a bishop, has an interesting basilica with three naves, a gymnasium, a technical school, and a seminary. The cathedral contains inscriptions, a mosaic pavement, and a good ambo decorated with mosaics resting on columns. In the principal street are memorial stones with inscriptions in honor of Charles V., surmounted by an old crucifix with a mosaic cross. Exclusive of the environs, the town has a population of 6130. The hills of Sessa are celebrated for their vines, the "Ager Falernus" of the Romans.

SESSION, Court of. See Scotland, p. 560 *supra*.

SETTLE, Elkanah (1648–1723), a minor poet and playwright of the Restoration period, immortalized by the ridicule of Dryden and Pope, was born at Dunstable in 1648. He is the "Doeg" of the second part of *Absalom and Achitophel*, and is treated by the satirist with somewhat more good-humored contempt than his companion in the pillory—Shadwell.

> Doeg, though without knowing how or why,
> Made still a blundering kind of melody;
> Spurr'd boldly on, and dash'd through thick and thin,
> Through sense and nonsense, never out nor in.

Dryden treats him as a sort of harmless fool, who "rhymed and rattled" along in perfect satisfaction with himself. For some time also he was taken by the public at his own valuation. At college he seems to have been regarded as a prodigy, and his juvenile verse was preferred to Dryden's. Coming to London, he began to produce tragedies. His *Empress of Morocco* (acted in 1673, when the author was twenty-five) was a signal success on the stage, and is said by Dennis to have been "the first play that was ever sold in England for two shillings, and the first that was ever printed with cuts." Puffed up by this success, Settle made haughty allusions in his preface, which excited the ire of his contemporaries; and Dryden coöperated with Crowne and Shadwell in writing sarcastic notes on *The Empress*. Settle's next collision with Dryden was also provoked by himself. He attempted a counterblast to Dryden's great satire in *Absalom Senior*, and was contemptuously demolished in return. Settle was then comparatively a young man, his age being thirty-five, but he had touched the height of his fame, and the remaining forty years of his life were not so successful. Dryden mockingly said of him that his ambition was to be "the master of a puppet-show," alluding to his duties in the office of city poet, in which he was one of the successors of Lodge, Middleton, Jonson, and Quarles; and to this he was literally reduced in his old age, keeping a booth at Bartholomew Fair, where he is said to have played the part of the dragon in green leather. He died in the Charterhouse in 1723.

SETTLEMENT, in law, is a mutual arrangement between living persons for regulating the present or future enjoyment of property. It also denotes the instrument by which such enjoyment is regulated. The prevailing notion of a settlement is the dealing with property in a manner different from that in which the law would have dealt with it apart from the settlement. Definitions of settlement for the purposes of the Acts are contained in the Acts of 1856, 1877, and 1882 (see below). They are, however, scarcely sufficient for a general definition. On the one hand they are too extensive, and include wills; on the other they are not comprehensive enough, as they apply only to real estate. They also include only cases of successive limitations, but the idea of succession does not in itself seem a necessary part of the conception of settlement, although no doubt most settlements contemplate successive enjoyment. Settlements may be either for valuable consideration or not: the latter are usually called voluntary, and are in law to some extent in the same position as revocable gifts; the former are really contracts, and in general their validity depends upon the law of contract. They may accordingly contain any provisions not contrary to law or public policy.[1]

The elements of the modern settlements are to be found in Roman law. The *vulgaris*, *pupillaris*, or *exemplaris substitutio* (consisting in the appointment of successive heirs in case of death, incapacity, or refusal of the heir first nominated) may have suggested the modern mode of giving enjoyment of property in succession. Such a *substitutio* could, however, only have been made by will, while the settlement of English law is, in the general acceptation of the term, exclusively an instrument *inter vivos*. The *dos* or *donatio propter nuptias* corresponds to a considerable extent with the marriage settlement, the instrument itself being represented by the *dotale instrumentum* or *pacta dotalia*. In the earliest period of Roman law no provision for the wife was required, for she passed under *manus* of her husband, and became in law his daughter, entitled as such to a share of his property at his death. In course of time the plebeian form of marriage by *usus*, according to which the wife did not become subject to *manus*, gradually superseded the older form, and it became necessary to make a provision for the wife by contract. Such provision from the wife's side was made by the *dos*, the property contributed by the wife or some one on her behalf towards the expenses of the new household. *Dos* might be given before or after marriage, or might be increased after marriage. It was a duty enforced by legislation to provide *dos* where the father possessed a sufficient fortune. *Dos* was of three kinds: *profectitia*, contributed by the father or other descendant on the male side; *adventitia*, by the wife herself or any person other than those who contributed *dos profectitia*; *receptitia*, by any person who contributed *dos adventitia*, subject to the stipulation that the property was to be returned to the person advancing it on dissolution of the marriage. The position of the husband gradually changed for the worse. From being owner, subject to an obligation to return the *dos* if the wife predeceased him, he became a trustee of the *corpus* of the property for the wife's family, retaining only the enjoyment of the income as long as the marriage continued. The contribution by the husband was called *donatio propter nuptias*.[2] The most striking point of difference between the Roman and English law is that under the former the children took no interest in the contributions made by the parents. Other modes of settling property in Roman law were the life interest or *usus*, the *fideicommissum*, and the prohibition of alienation of a *legatum*.

[1] In this English law allows greater freedom than French. By § 791 of the Code Napoléon, in a contract of marriage the succession to a living person cannot be renounced.

[2] See Hunter, *Roman Law*, p. 150; Maine, *Early History of Institutions*, lect. xi.

The oldest form of settlement in England was perhaps the gift in frankmarriage to the donees in frankmarriage, and the heirs between them two begotten (Littleton, § 17). This was simply a form of gift in special tail, which became up to the reign of Queen Elizabeth the most usual kind of settlement. The time at which the modern form of settlement of real estate came into use seems to be doubtful. There does not appear to be any trace of a limitation of an estate to an unborn child prior to 1556. In an instrument of that year such a limitation was effected by means of a feoffment to uses. The plan of granting the freehold to trustees to preserve contingent remainders[1] is said to have been invented by Lord Keeper Bridgman in the 17th century, the object being to preserve the estate from forfeiture for treason during the Commonwealth.[2] The settlement of chattels is no doubt of considerably later origin, and the principles were adopted by courts of equity from the corresponding law as to real estate.

At the present time the settlement in England is, so far as regards real estate, used for two inconsistent purposes,—to "make an eldest son," as it is called, and to avoid the results of the right of succession to real property of the eldest son by making provision for the younger children. The first result is generally obtained by a strict settlement, the latter by a marriage settlement, which is for valuable consideration if antenuptial, voluntary if post-nuptial. At the same time it should be remembered that these two kinds of settlement are not mutually exclusive; a marriage settlement may often take the form of a strict settlement and be in substance a resettlement of the family estate.

There are three possible varieties of the marriage settlement: (1) the dotal system (*régime dotal*), under which the husband generally has the usufruct but not the property in the *dos;* this is the system generally followed in countries where the Roman law prevails; (2) the system of community of goods (*communauté de biens*), by which the wife becomes a kind of partner of the husband; this system, said to have been originally the custom of ancient Germany, is in vogue in France and Louisiana; (3) the system of separate property, by which (subject to contract) the wife's property is free from the control of her husband; this system prevails in the United Kingdom and the United States. An ordinary English marriage settlement of personalty is a deed to which the parties are the intended husband and wife and trustees nominated on their behalf. It generally contains the following clauses: a power to vary the investments of the settled property within limits; trusts of the income for the benefit of the husband and wife during their lives; trusts for the issue, usually according to the appointment of the husband and wife or the survivor, and in default for sons attaining twenty-one and for daughters attaining that age or marrying, equally, subject to a "hotchpot" clause, charging the children with the amount of any previous appointments; a power of advancement of the portions of children in anticipation; a trust for the maintenance of infant children after the death of the parents, with a direction for the accumulation of surplus income; ultimate trusts fixing the destination of the settled property in default of issue. The receipt and trustee clauses, at one time usual, have been rendered unnecessary by recent legislation. The Conveyancing Act, 1881, superseding Lord St. Leonards' Act of 1859 and Lord Cranworth's Act of 1860, gives power to appoint new trustees, and makes a trustee's receipt a sufficient discharge. Trustees were formerly much restricted in their investments, but various Acts of Parliament have now increased their powers of choice of investment (see TRUST). The settlement of real estate is still a matter of greater difficulty than that of personalty, though it has been considerably simplified by recent legislation. A short statutory form of settlement of real estate is provided by the Conveyancing Act, 1881 (Fourth Schedule, Form iv.). The Act further enacts that a covenant by the settlor for further assurance is to be implied. This takes the place of those covenants usually inserted in settlements before the Act, which were the ordinary covenants for title. (See REAL ESTATE.) The Settled Land Act, 1882, gives statutory authority to certain provisions generally inserted by conveyancers. The clauses must, however, still vary infinitely according to the circumstances of particular cases. Where the settlement is of copyholds, the usual course is to surrender them to the use of trustees as joint tenants in fee upon such trusts as will effect the desired devolution of the property.

A strict settlement of real estate usually takes place on the coming of age or marriage of the eldest son, if it be the intention of the parties that the estate should continue undivided. The consideration for the settlement in the first case is usually an immediate allowance made to the son, in the second the marriage itself, a valuable consideration. It will appear on referring to the articles ENTAIL and REAL ESTATE that an estate cannot be entailed for a period exceeding a fixed number of existing lives and an additional term of twenty-one years, but that if it be sought to bar the entail within that period the consent of the protector of the settlement must be obtained. The process of resettlement is thus described by Lord St. Leonards: "Where there are younger children, the father is always anxious to have the estate resettled on them and their issue, in case of failure of issue of the first son. This he cannot accomplish without the concurrence of the son; and, as the son, upon his establishment in life in his father's lifetime, requires an immediate provision, the father generally secures to him a provision during their joint lives as a consideration for the resettlement of the estate in remainder upon the younger sons." The settlement usually takes the form of a life estate for the father, followed by a life estate for the son, with remainder in tail to the unborn child of the son, the continuance of the estate in the family being further secured by a series of cross-remainders. There is often a name and arms clause, under which, by means of a shifting use (see TRUST), every person succeeding to the settled estate as tenant in tail is forced to assume the name and arms of the settlor under penalty of forfeiture of his estate. Certain parts of the personalty of the settlor are often settled upon trusts to devolve with the real estate. In order to attain this end, the chattels are not simply subjected to the same limitations as the real estate. If so subjected, they would vest absolutely in the first tenant in succession, as no estate can be limited in personalty (see PERSONAL ESTATE). A declaration is added that they shall not vest absolutely in any tenant until he shall attain twenty-one, and in case he should die under that age that they shall devolve as nearly as possible in the same way as the lands. By means of strict settlement the actual possessor of a settled estate at any given time is in general only a tenant for life. It is a rule of law that in a settlement of this nature there should be a full and complete communication of all material circumstances by the one party to the other.

It is only within a comparatively recent period that any dissatisfaction at the system of settlement has been felt. In 1829 the Real Property Commissioners saw no reason to recommend any alteration of the law as it then existed. To use the words of the First Report, p. 6, "Settlements bestow upon the present possessor of an estate the benefits of ownership, and secure the property to his posterity. The existing rule respecting perpetuities has happily hit the medium between the strict entails which prevail in the northern part of the island, and by which the property entailed is for ever abstracted from commerce,[3] and the total prohibition of substitutions[4] and the excessive restriction of the power of devising[5] established in some countries on the Continent of Europe. In England families are preserved, and purchasers always find a supply of land in the market." This optimistic view, it is scarcely necessary to say, is not the one generally accepted at present. The inconveniences inseparable in an economical point of view from the settlement of land have been proposed to be met in two ways,—(1) by a total prohibition of the creation of life estates (see LAND), and (2) by an extension of the powers of the limited owner. The latter is the one which has hitherto commended itself to the legislature of the United Kingdom.

Up to thirty years ago a settled estate in England or Ireland could be sold or leased only under the authority of a private Act of Parliament. The dealings of the limited

[1] The appointment of such trustees has been rendered unnecessary by 8 and 9 Vict. c. 106 and 40 and 41 Vict. c. 33.

[2] This sketch of the history of settlement is abridged from a paper by the late Mr. Joshua Williams, *Papers of the Juridical Society*, vol. i. p. 45.

[3] The law of Scotland was shortly afterwards altered by the Rutherford Act of 1848 (see ENTAIL).

[4] As by the Code Napoléon, § 896. By § 898 *substitutions vulgaires* are, however, practically allowed, the inconsistency with § 896 being avoided by affirming that these are not substitutions at all. In other countries the right of settlement or substitution has been much modified by legislation, mostly in the direction of limiting the authority of the settler. Thus in Austria no family settlement (*Familien-Fideicommiss*) can be created without the consent of the legislature. *Civil Code*, § 618.

[5] In France the proprietor may only devise half, a third, or a quarter of his estate, according to the number of his children.

owner with his property were practically confined to certain powers of raising money for draining conferred by 8 and 9 Vict. c. 56 and the Public and Private Drainage Acts (now repealed). The first general Act was the Leases and Sale of Settled Estates Act, 1856, which proceeded on the principles generally followed in the private Acts. The Act allowed the tenant for life to demise the premises (except the principal mansion house) for various terms, and to sell with the approval of the court. Several amending Acts were passed, and finally the law was consolidated and amended by the Settled Estates Act, 1877 (40 and 41 Vict. c. 18). Meanwhile the Improvement of Land Act, 1864 (which applies to the United Kingdom), and the Limited Owners' Residence Acts, 1870 and 1871, had been passed. The Act of 1864 allowed the owner of a settled estate to charge upon the land, by way of rent-charge, the expenses of certain improvements, such as drainage, irrigation, inclosing, reclamation, clearing, erection of laborers' cottages and farmhouse buildings, planting for shelter, construction of any buildings which will increase the value of the land for agricultural purposes, and construction of jetties or landing-places on the sea-coast or navigable rivers and lakes. This list of improvements has been since extended by the Settled Land Act, 1882. The Act of 1870 enabled the owners of settled estates to charge such estates with the expense of building mansions as residences. The building of such mansions is by the Act of 1871 an improvement within the meaning of the Act of 1864. The Settled Estates Act, 1877 (40 and 41 Vict. c. 18), allowed the tenant for life, or for a greater estate, of a settled estate, to demise settled land on an agricultural lease for a term not exceeding twenty-one years (in Ireland thirty-five years). The lease must not be without impeachment of waste. This is the only case in which the powers of the Act may be exercised without the leave of the court. The court may authorize leases of any settled estates or of any rights or privileges over or affecting any settled estates, subject to the conditions that—(1) the lease be made to take effect in possession at or within one year next after the making, and be for a term for an agricultural lease as above, for a mining lease not exceeding forty years, a repairing lease sixty years, a building lease ninety-nine years, with power for the court to grant for a longer term if in accordance with the custom of the district and beneficial to the inheritance; (2) the best rent must be reserved; (3) in a mineral lease three-fourths of the rent is to be invested (one-fourth where the limited owner is entitled to work the minerals for his own benefit); (4) the lease is not to authorize felling of trees except for the purpose of clearing for building; (5) the lease is to be by deed, and is to contain a condition for reëntry on non-payment of rent for twenty-eight days. The court may also authorize sales of settled estates and of timber, and dedication for streets, roads, squares, gardens, sewers, and other works. The application to the court (which in England is the Chancery Division or the Chancery of Lancashire, in Ireland the Chancery Division) is by petition in a summary way with the consent of the persons having any beneficial estate under the settlement, and all trustees having any estate on behalf of any unborn child. The court may dispense with consent under certain circumstances. No application is to be granted by the court where a similar application has been refused by parliament. Money received on sale under the Act is to be invested as the Act directs, for the benefit of the settled estate. In 1882 the powers of the limited owner were still further increased. In that year was passed the Settled Land Act, 1882 (45 and 46 Vict. c. 38), since amended by 47 and 48 Vict. c. 19. For this very valuable Act the statute book is indebted to the late Earl Cairns. It does not repeal the Act of 1877, but gives cumulative powers. The Act of 1877 must still be brought into action in certain cases to which the Act of 1882 does not apply. The broad distinction between the two Acts is that the powers given by the Act of 1877 are based entirely, except in agricultural leases, on judicial proceedings, while those given by the Act of 1882 may be exercised by the tenant for life at his option, generally without the consent of trustees or the court. The powers are those usually inserted in settlements of real estate, and are conferred upon every tenant for life beneficially entitled to possession. This includes a tenant in tail by Act of Parliament restrained from defeating an estate tail, but not a tenant in tail where the land in respect of which he is restrained was purchased with money provided by parliament,[1] a tenant in fee simple subject to an executory limitation, a person entitled to a base fee, a tenant for years determinable on a life, a tenant *pur autre vie*, a tenant in tail after possibility of issue extinct, a tenant by the curtesy, etc. A married woman may exercise the powers given by the Act in spite of any restraint on anticipation contained in the settlement. The Act does not apply to corporations, whether sole or aggregate. The chief powers given by the Act are those of selling and leasing. A tenant for life may sell settled land or any part of it, or any easement, right, or privilege over it, or the seignory of a manor, and may make exchange or partition. A sale must be for the best price, and an exchange or partition for the best consideration; the sale may be in one lot or several, and by auction or private contract. A reservation as to user or as to mines and minerals may be imposed. Settled land in England may not be exchanged for land out of England. A lease is not to exceed for building ninety-nine years, mining sixty, any other kind twenty-one. The regulations as to leases are in general correspondence with those of the Act of 1877. The time for which non-payment of rent gives a right of reëntry is thirty instead of twenty-eight days, and there are additional regulations as to building and mining leases. Where the tenant for life is impeachable for waste in respect of mines, three-fourths of the mining rent is to be set aside as capital money, in other cases one-fourth. The tenant for life may surrender and regrant leases. The principal mansion house and the demesnes thereof, and other lands usually occupied therewith, cannot be sold or leased without the consent of the trustees of the settlement or the order of the court. The Act provides for three kinds of sale: (1) by the tenant for life *mero motu*, the ordinary case; (2) with consent of trustees or the court, as in the case of the principal mansion and of the application of money paid for a lease or reversion; (3) by order of the court, as in the case of the variation of a building or mining lease according to the circumstances of the district, of parliamentary opposition for the protection or recovery of settled land, and of the sale or purchase of chattels as heirlooms to devolve with land.[2] Land acquired by purchase, exchange, or partition is to be settled as far as possible on the same trusts as the other settled property. Capital money is to be applied as the Act directs, generally for the benefit of the settled property. The tenant for life may enter into a contract for carrying into effect the purposes of this Act. A contract not to exercise the powers of the Act is void. As to procedure, an application to the Chancery Division is to be made by petition or summons. Jurisdiction is conferred upon county courts (in Ireland civil bill courts) in respect to land or personal chattels settled or to be settled, not exceeding in capital value £500 [$2430] or in annual value £30 [$145.80]. Rules of court have been framed for the purpose of carrying into effect the provisions of the Acts of 1877 and 1882. For more minute information than can be given in this place the Acts and rules themselves must be consulted.

The necessity for a settlement, as far as the wife's interests are concerned, has been diminished by the Married Women's Property Act, 1882 (45 and 46 Vict. c. 75). It is still, however, usual to have a settlement on marriage, especially where there is property of any considerable value. The Act contains a saving of existing settlements and a power to make future settlements with or without restriction against anticipation (not to be valid against a married woman's ante-nuptial debts). No settlement or agreement for a settlement is to have greater validity against a married woman's creditors than such settlement or agreement would have when made or entered into by a man. A future or reversionary interest in settled personalty is specially excepted from the operation of Malins's Act (20 and 21 Vict. c. 5), under which a married woman may by deed acknowledged dispose of her future or reversionary interest in unsettled personalty. The former law as to *equity to a settlement* seems to have been rendered obsolete by the Married Women's Property Act. The doctrine of equity formerly was in accordance with the maxim, "He who seeks equity must do equity,"—that, where a husband was forced to obtain the assistance of a court of equity to reach property to which he was entitled in right of his wife, equity would only aid him on condition of his settling a certain portion on his wife. Now that a husband cannot succeed to any property in right of his wife during her lifetime, the reason for the doctrine of equity to a settlement has disappeared.

As a rule a settlement can only be made by a person not under disability, therefore apart from statute not by a lunatic, or a bankrupt, and generally not by an infant. But by the Infants' Settlement Act (18 and 19 Vict. c. 43) infant males of twenty or over or infant females of seventeen or over may with the approbation of the Chancery

[1] That is to say, the Act would apply to the estates tail of the marquis of Abergavenny or the earl of Shrewsbury, but not to Blenheim or Strathfieldsaye, purchased with public money for the dukes of Marlborough and Wellington (see REAL ESTATE).

[2] Land in this sense has quite recently been held to include an hereditary dignity, such as a baronetcy.

Division obtained by petition make a valid settlement or contract for a settlement of all or any part of their property. By the Acts of 1877 and 1882 the powers of the Acts may in certain cases be exercised by trustees of a settlement, trustees in bankruptcy, committees of lunatics, and guardians of infants.

Where the parties are not in a position to make an immediate settlement, articles for a settlement are sometimes entered into, but more rarely than formerly on account of the facilities offered by the Infants' Settlement Act. The court will enforce the execution of a settlement in accordance with the articles, and will reform one already made if not in accordance with them. The court will also enforce the specific performance of any contract on the faith of which a marriage has taken place, in spite of the provisions of § 4 of the Statute of Frauds (see FRAUD).[1] It should be noticed that marriage itself is not such a part performance of a contract as to give the court jurisdiction. An imperfect obligation arising from an informal antenuptial agreement can be made binding as between the parties by a post-nuptial settlement; but this will not protect such a settlement from being treated as a voluntary settlement against creditors.

A settlement or contract for settlement made in consideration of marriage or for other valuable consideration is as a rule irrevocable by the settlor and good against creditors. The only exception or apparent exception is the provision in the Bankruptcy Act, 1883 (46 and 47 Vict. c. 52, § 47 (2)), that any covenant or contract made in consideration of marriage for the future settlement on or for the settlor's wife or children of any money or property wherein he had not at the date of his marriage any estate or interest, and not being money or property of or in right of his wife, shall, on his becoming bankrupt before the property or money shall have been actually transferred or paid, be void against the trustee in bankruptcy. With regard to voluntary settlements, 13 Eliz. c. 5 avoids as against creditors conveyances of lands or chattels contrived to delay, hinder, or defraud creditors or others, with a proviso protecting estates or interests conveyed on good consideration and *bona fide* to persons not having notice of fraud. 46 and 47 Vict. c. 52, § 47 (1), enacts that any settlement of property, not being a settlement made before and in consideration of marriage or made in favor of a purchaser or incumbrancer in good faith and for valuable consideration, or a settlement made on or for the wife or children of the settlor of property which has accrued to the settlor after marriage in right of his wife, shall, if the settlor becomes bankrupt within two years after the date of the settlement, be void against the trustee in the bankruptcy, and shall, if the settlor becomes bankrupt within ten years, be void against the trustee unless the parties claiming under the settlement can prove that the settlor was at the time of making the settlement able to pay all his debts without the aid of the settled property, and that the interest of the settlor in such property had passed to the trustee of the settlement on the execution thereof. 27 Eliz. c. 4 was passed for the benefit of purchasers, as 13 Eliz. c. 5 was for that of creditors, but refers to real estate and chattels real only. It enacts that every conveyance of lands with intent to defraud purchasers shall be void as against such purchasers only, and that conveyances with power of revocation shall be void against subsequent purchasers. The Act has been construed to mean that a voluntary conveyance of real estate is void as against a subsequent purchaser, mortgagee, or lessee for value. With these exceptions a voluntary settlement is good as between the settlor and the objects of the settlement, and as between them and third persons. So far is this the case that the court will not assist a settlor to destroy the effect of a voluntary settlement by compelling specific performance against a subsequent purchaser. On the other hand the court will not enforce specific performance of a voluntary settlement, in spite of its being a contract under seal. Such an instrument, however, creates a debt and will be admitted to proof in a creditors' suit.[2]

Scotland.—A *disposition and settlement* is a mode of providing for the devolution of property after death, and so corresponds rather to the English will than the English settlement. The English marriage settlement is represented in Scotland by the *contract of marriage*, which, like the English settlement, may be ante- or post-nuptial. The main difference between the ante- and the post-nuptial contract is the extent to which the property the subject of the contract may be withdrawn from creditors. In the former case a preference or *jus crediti* is according to circumstances conferred on the wife or children; in the latter case the wife or children cannot compete with the creditors. A post-nuptial contract is also liable to revocation by the husband or wife. The Married Women's Property Act, 1881, while it makes the wife complete mistress of her property, at the same time does not exclude or abridge the power of settlement by ante-nuptial contract of marriage.

A contract of marriage may be made with or without the creation of trustees, the latter being the more usual form. If the contract settle hereditary property, it generally contains a narrative or inductive clause, containing the names of the parties with an obligation to celebrate the marriage, a disposition of the estate with its destination, provisions as to the wife and younger children, and a declaration that these provisions shall be in full of their legal claims, a conveyance by the wife of her whole means and estate to her husband or the trustees, an appointment of trustees to secure implement of provisions to the wife and children, a registration clause, and a testing clause. If the contract settle movables, it is, *mutatis mutandis*, in much the same form, with the addition of a clause excluding the *jus mariti* of a future husband of the wife (see *Juridical Styles*, vol. i. p. 174, vol. ii. p. 498). The Rutherford Act (11 and 12 Vict. c. 36) and the Entail Act, 1882 (45 and 46 Vict. c. 53), specially provide that settlements by marriage contract are not to be disappointed until the birth of a child, who by himself or his guardian consents to disentail, or until the marriage is dissolved, unless with the consent of the trustees of the contract. Improvements by limited owners were allowed by law much earlier than in England. 10 Geo. III. c. 51 enabled heirs of entail to charge the entailed estates with the sums of money laid out by them in building mansions. This principle was expressly adopted for England, as the preamble of the Act shows, by the Limited Owners' Residence Act, 1870. The Rutherford Act and other Acts empowered heirs of entail to excamb, to feu, to lease, to charge by bond and disposition in security, to sell, to grant family provisions, and to erect laborers' cottages. The Settled Estates Act and Settled Land Act do not apply to Scotland. Substitution, as in Roman law, can only be made by testamentary or *mortis causa* disposition. The Rutherford Act and the Entail Amendment Act, 1868 (31 and 32 Vict. c. 84), more strict than the law of England against perpetuities, forbid the creation of a life-rent interest in heritables or movables except in favor of a party in life at the date of the deed creating such interest.

United States.—Marriage Settlements are not in as common use as in England, no doubt owing to the fact that the principle of the Married Women's Property Act was the law of most of the States of the Union long before its adoption by England. In Louisiana, in the absence of stipulation to the contrary, community of goods is the rule. Settlements other than marriage settlements are practically unknown in the United States. Property cannot, as a general rule, be tied up to anything like the extent still admissible in England. In those States where entail is allowed the entail may be barred by simple means of alienation.

(J. WT.)

SETTLEMENT, ACT OF. By this Act, 12 and 13 Will. III. c. 2, passed in 1701 (followed by the parliament of Scotland in the Act of Union, 1707, c. 7), the crown was settled upon the Princess Sophia, electress and duchess dowager of Hanover, granddaughter of James I., and the heirs of her body, being Protestants. The Act contained in addition some important constitutional provisions. Those which are still law are as follows: (1) that whosoever shall hereafter come to the possession of this crown shall join in communion with the Church of England as by law established; (2) that in case the crown of this realm shall hereafter come to any person not being a native of this kingdom of England, this nation be not obliged to engage in any war for the defence of any dominions or territories which do not belong to the crown of England without the consent of parliament; (3) that after the limitation shall take effect no person born out of the kingdoms of England, Scotland, or Ireland, or the dominions thereunto belonging, although he be naturalized or made a denizen (except such as are born of English parents), shall be capable to be of the privy council or a member of either House of Parliament, or enjoy any office or place of trust, either civil or military, or to

[1] At one time the ecclesiastical courts went farther, and enforced specific performance of the ceremony of marriage itself. After a contract of marriage *per verba de præsenti* or *per verba de futuro*, a celebration *in facie ecclesiæ* might have been decreed. This jurisdiction of the ecclesiastical courts was finally abolished by 4 Geo. IV. c. 76.

[2] See Williams, *The Settlement of Real Estates*; Davidson, *Precedents of Conveyancing*, vol. iii.; Wolstenholme and Turner, *The Settled Land Act*; Middleton, *The Statutes Relating to Settled Estates*.

have any grant of lands, tenements, or hereditaments from the crown to himself, or to any other or others in trust for him;[1] (4) that after the limitation shall take effect judges' commissions be made *quamdiu se bene gesserint*,[2] and their salaries ascertained and established, but upon the address of both Houses of Parliament it may be lawful to remove them; (5) that no pardon under the great seal of England be pleadable to an impeachment by the Commons in parliament. The importance of the Act of Settlement appears from the fact that in all the Regency Acts it is specially mentioned as one of those Acts which the regent may not assent to repeal (see REGENT). To maintain or affirm the right of any person to the crown, contrary to the provisions of the Act of Settlement, is treason by 6th Anne, c. 7.

SETTLEMENT OF THE POOR. See POOR LAWS.

SÉTUBAL, called by the English St. Ubes, a port and commercial town in the province of Estremadura, Portugal, nearly 20 miles southeast of Lisbon, lining for about three-quarters of a mile the north shore of a harbor of the same name, 3 leagues long by half a league broad, and inferior only to that of Lisbon, at the end of a fertile valley of 6 miles long from Palmella, where the Sabo river discharges into the Bay of Sétubal, and on the Portuguese railway (Lisbon-Barreiro-Sétubal). It is overtopped on the west by the great red treeless range of Arrabida. In the sand-hills of a low-lying promontory in the bay, over against Sétubal, are the ruins of "Troia," uncovered in part by heavy rains in 1814, and again in 1850 by an antiquarian society. These ruins of "Troia," among which have been brought to view a beautiful Roman house and some 1600 Roman coins, refer, beyond almost all dispute, to Cetobriga, which flourished 300–400 A.D. In the neighborhood, on a mountain 1700 feet high, is the cloister Arrabida, with stalactite cavern, whither pious pilgrimages are made. There are five forts for the defence of the harbor, and that of St. Philip, built by Philip III., commands the town. Sétubal is an emporium of the Portuguese salt trade carried on principally with Scandinavian ports, the salt being deemed the finest for curing meat and fish. By reason of this advantage and the excellence of its oranges, the best in Portugal, and of its Muscatel grapes, it has much commercial importance, and is the fourth city in the kingdom. It also manufactures leather and does a considerable fishing trade. There are five churches, several convents, a theatre, a monument of the poet Bocage, who was born here, and an arsenal. Among its other public buildings are the Stapal, the Bomfin, which has a handsome fountain, the Fonte Nova, and the Annunciatá. Sétubal suffered severely, along with Lisbon, from the earthquake of 1755. The population was 14,798 in 1878.

SEVENOAKS, a market town of Kent, England, situated on high ground about a mile from the railway station, 25 miles southeast of London by the London, Chatham, and Dover Railway, and 20 by the South-Eastern Railway. It consists principally of two streets which converge at the south end, near which is the church of St. Nicholas, of the 13th, 14th, and 15th centuries, restored in 1878, and containing monuments of the Amherst family and a tablet to William Lambarde, the "Perambulator" of Kent (d. 1601), removed from the old parish church of Greenwich when that was demolished. At the grammar school founded in 1418 by Sir William Sevenoke, lord mayor of London, George Grote received his education. There is also a school founded by Lady Margaret Boswell, wife of Sir William Boswell, ambassador of Charles I. at The Hague, and almshouses founded by Sir William Sevenoke in connection with his school. The Walthamstow Hall for 100 children, daughters of Christian missionaries, erected at a cost of £22,000 [$106,920], was opened in 1882. Close to Sevenoaks is Knole Park, one of the finest old residences in England, which in the time of King John was possessed by the earl of Pembroke, and after passing to various owners was bought by Archbishop Bourchier (d. 1486), who rebuilt the house. He left the property to the see of Canterbury, and about the time of the dissolution it was given up by Cranmer to Henry VIII. By Elizabeth it was conferred first on the earl of Leicester and afterwards on Thomas Sackville, earl of Dorset, by whom it was in great part rebuilt and fitted up in regard to decoration and furniture very much as it at present exists. In the time of Elizabeth county assizes were held in the town. Of late years Sevenoaks has very much increased by the addition of villa residences for persons having their business in London. The population of the urban sanitary district (area 2028 acres) in 1871 was 4118, and in 1881 it was 6296.

SEVEN SLEEPERS OF EPHESUS, THE, according to the most common form of an old legend of Syrian origin, first referred to in Western literature by Gregory of Tours (*De Glor. Mart.*, c. 95), were seven Christian youths of Ephesus, who, to escape the rage of Decius, lived for some time in concealment in a cave. The enemy at last, however, discovered their hiding place, and caused great stones to be rolled to its mouth that they might die of hunger. The martyrs fell asleep in a mutual embrace. The occurrence had long been forgotten, when it fell out, in the thirtieth year of Theodosius II., 196 years afterwards, that a certain inhabitant of Ephesus, seeking shelter for his cattle, rediscovered the cave on Mount Cœlian, and, letting in the light, awoke the inmates, who sent one of their number down to buy food. Cautiously approaching the city, the lad was greatly astonished to find the cross displayed over the gates, and on entering to hear the name of Christ openly pronounced. By tendering coin of the time of Decius at a baker's shop he roused suspicion, and in his confusion being unable to explain how he had come by the money, he was taken before the authorities as a dishonest finder of hidden treasure. He was easily able to confirm the strange story he now had to tell by actually leading his accusers to the cavern where his six companions were found, youthful and rosy and beaming with a holy radiance. Theodosius, hearing what had happened, hastened to the spot in time to hear from their lips that God had wrought this wonder to confirm his faith in the resurrection of the dead. This message once delivered, they again fell asleep.

Gregory says he had the legend from the interpretation of "a certain Syrian;" in point of fact the story is very common in Syriac sources. It forms the subject of a homily of Jacob of Sarug (*ob.* 521 A.D.), which is given in the *Acta Sanctorum*. Another Syriac version is printed in Land's *Anecdota*, iii. 87 *sq.*; see also Barhebræus, *Chron. Eccles.*, i. 142 *sq.*, and compare Assemani, *Bib. Or.*, i. 335 *sq.* Some forms of the legend give eight sleepers,—*e.g.*, an ancient MS. of the 6th century now in the British Museum (*Cat. Syr. MSS.*, p. 1090). There are considerable variations as to their names. The legend rapidly attained a wide diffusion throughout Christendom; its currency in the East is testified by its acceptance by Mohammed (sur. xviii.), who calls them *Aṣḥāb al-Kahf*, "the men of the cave." According to Al-Birúní (*Chronology*, tr. by Sachau, p. 285) certain undecayed corpses of monks were shown in a cave as the sleepers of Ephesus in the 9th century. The seven sleepers are a favorite subject in early mediæval art.

SEVERN, THE, next to the Thames in length among the rivers of England, rises at Maes Hafren on the eastern side of Plinlimmon, on the south-south-west borders of Montgomeryshire, and flows in a nearly semicircular course of about 200 miles to the sea; the direct distance from its source to its mouth in the Bristol Channel is about 80 miles. By the Britons it was called Halfren, and its old Latin name was *Sabrina*. Through Montgomeryshire its course is at first

[1] This clause is virtually repealed by the Naturalization Act, 1870 (33 and 34 Vict. c. 14, § 7), as to persons obtaining a certificate of naturalization.

[2] Their commissions had previously been made *durante bene placito*.

in a southeasterly direction, and for the first 15 miles it flows over a rough precipitous bed. At Llanidloes, where the valley widens to a breadth of one or two miles and assumes a more fertile appearance, it bends towards the northeast, passing Newtown and Welshpool. On the borders of Shropshire it receives the Vyrnwy, and then turning in a southeasterly direction enters the broad rich plain of Shrewsbury, after which it bends southward past Ironbridge and Bridgnorth to Bewdley in Worcestershire. In Shropshire it receives a number of tributaries (see SHROPSHIRE). Still continuing its southerly course through Worcestershire it passes Stourport, where it receives the Stour (left), and Worcester, shortly after which it receives the Teme (right). It enters Gloucestershire at Tewkesbury, where it receives the Avon (left), after which, bending in a southwesterly direction, it passes the town of Gloucester, 18 miles below which the estuary widens out into the Bristol Channel, at the point where it receives from the left the Lower Avon or Bristol river, and from the right the Wye.

From Newtown its fall is 465 feet, the average fall per mile being about 2 feet 3 inches, but from Ironbridge to Gloucester, a distance of about 70 miles, the fall is only about 103 feet. Between Stourport and Gloucester the breadth is 150 feet, but below that town the breadth rapidly increases and the banks become bolder and more picturesque. Owing to the gradual decrease in the width and depth of the Bristol Channel the tide enters with great force, forming a tidal wave or bore about 9 feet in height, which at certain times causes great destruction, among the more serious inundations being those of 1606, 1687, 1703, and 1883. The total area drained by the Severn is about 4500 square miles. Its navigation extends to about 150 miles above its mouth; barges can ascend as far as Stourport, and large vessels to Gloucester. Owing to the difficulties of the navigation the Gloucester and Berkeley Ship Canal, 18 miles in length, was constructed, admitting vessels of 350 tons to Gloucester, the river only admitting vessels of 150 tons. The only other important port is Bristol, but there are a few smaller ports and fishing towns, while by means of canals the Severn has connection with some of the principal towns of England. With the Thames it is connected by the Stroudwater and Thames and Severn Canals; by various canals it has communication with the Trent and the rivers of the north; and the Hereford and Gloucester Canal connects those two cities. The Severn is a good salmon river, and is specially famous for its lampreys.

SEVERN, JOSEPH (1793–1879), portrait and subject painter, was born in 1793. During his earlier years he practiced portraiture as a miniaturist; and, having studied in the schools of the Royal Academy, he exhibited his first work in oil, Hermia and Helena, a subject from the *Midsummer Night's Dream*, in the Royal Academy Exhibition of 1819. In 1820 he gained the gold medal and a three years' travelling studentship for his Una and the Red Cross Knight in the Cave of Despair, a painting now in the possession of the representatives of the late Lord Houghton. He accompanied his friend Keats the poet to Italy, and nursed him till his death in 1821. In 1861 he was appointed British consul at Rome, a post which he held till 1872, and during a great part of the time he also acted as Italian consul. His most remarkable work is the Spectre Ship from the *Ancient Mariner*. He painted Cordelia Watching by the Bed of Lear, the Roman Beggar, Ariel, the Fountain, and Rienzi, executed a large altarpiece for the church of St. Paul at Rome, and produced many portraits, including one of Baron Bunsen and several of Keats. He died at Rome, August 3, 1879.

SEVERUS, LUCIUS SEPTIMIUS, the twenty-first emperor of Rome, reigned from 193 to 211 A.D. He was born in 146 at Leptis Magna, an African coast town in the district of Syrtes, whose ancient prosperity is still attested by its extensive ruins. In this region of Africa, despite its long possession by the Romans, the Punic tongue was still spoken by the people in general. Severus had to acquire Latin as a foreign language, and is said to have spoken it to the end of his days with a strong African accent. After he had arrived at the throne he dismissed abruptly from Rome a sister who had come to visit him, because he felt shame at her abominable Latin. Yet Severus and his dynasty were almost the only emperors of provincial descent who frankly cherished the province of their origin, while the province showed true loyalty to the only Roman emperor ever born on African soil, and to the successors who derived their title from him.

Of the origin of the Severi nothing is known: it is a natural but very doubtful conjecture that the L. Septimius Severus, a native of Africa, addressed by the poet Statius, was an ancestor of the emperor who bore the same name. The father of Severus was a Roman citizen of equestrian rank, and it may safely be affirmed that the family held a poor position when he was born, but had risen in importance by the time he reached manhood. Two of his uncles attained to consular rank. Fulvius Pius, the maternal grandfather of Severus, is often identified with the man of that name who was governor of Africa, and, after being condemned for corruption by Pertinax, was highly honored by Didius Julianus; but dates are strongly against the identification. Of the future emperor's education we learn nothing but its results. Spartianus declares him to have been "very learned in Latin and Greek literature," to have had a genuine zeal for study, and to have been fond of philosophy and rhetoric. But the learning of rulers is often seen through a magnifying medium, and we may better accept the statement of Dio Cassius that in the pursuit of education his eagerness was greater than his success, and that he was rather shrewd than facile. No doubt in his early years he acquired that love for jurisprudence which distinguished him as emperor. Of his youth we know only that it was entirely spent at Leptis. Beyond that there is merely one anecdotal fabrication giving an account of youthful wildness.

The removal of Severus from Leptis to Rome is attributed by his biographer to the desire for higher education, but was also no doubt due in some degree to ambition. From the emperor Marcus Aurelius he early obtained, by intercession of a consular uncle, the distinction of the broad purple stripe. At twenty-six, that is, almost at the earliest age allowed by law, Severus attained the quæstorship and a seat in the senate, and proceeded as *quaestor militaris* to the senatorial province of Bætica, in the Peninsula. While Severus was temporarily absent in Africa in consequence of the death of his father, the province of Bætica, disordered by invasion and internal commotion, was taken over by the emperor, who gave the senate Sardinia in exchange. On this Severus became military quæstor of Sardinia. His next office, probably in 174, was that of legate to the proconsul of Africa, and in the following year he was tribune of the plebs. This magistracy, though far different from what it had been in the days of the republic, was still one of dignity, and brought with it promotion to a higher grade in the senate. During the tribunate he married his first wife Marcia, whose name he passed over in his autobiography, though he erected statues of her after he became emperor. In 178 Severus became prætor, not by favor of the emperor, but by competition for the suffrages of the senators. Then, probably in the same year, he went to Spain as legate; after that (179) he commanded a legion in Syria. The death of Marcus Aurelius seems in some way to have interrupted his career; he was unemployed for several years, and devoted great part of his leisure to the study of literature, religion, and antiquities (so says Spartianus) at Athens. The year of Severus's first consulship cannot be determined with precision, but it falls within the space between 185 and 190. In this time also falls the marriage with Julia, afterwards famous as Julia Domna, whose acquaintance he had no doubt made when an officer in Syria. Her two sons Bassianus (known as Caracalla) and Geta were probably born in

188 and 189. Severus was governor in succession of Gallia Lugdunensis, Sicily, and Pannonia Superior. He was in command of three legions at Carnuntum, the capital of the province last named, when news reached him that Commodus had been murdered by his favorite concubine and his most trusted servants.

Up to this moment the career of Severus had been ordinary in its character. He had not raised himself above the usual official level. He had achieved no military distinction,—had indeed seen no warfare beyond the petty border frays of a frontier province. But the storm that now tried all official spirits found his alone powerful enough to brave it. Three imperial dynasties had now been ended by assassination. The Flavian line had enjoyed much shorter duration and much less prestige than the other two, and the circumstances of its fall had been peculiar in that it was probably planned in the interest of the senate and the senate certainly reaped the immediate fruits. But the crisis which arose on the death of Nero and the crisis which arose on the death of Commodus were strikingly alike. In both cases it was left to the army to determine by a struggle which of the divisional commanders should succeed to the command-in-chief, that is, to the imperial throne. In each case the contest began with an impulsion given to the commanders by the legionaries themselves. The soldiers of the great commands competed keenly for the honor and the material advantages to be won by placing their general in the seat of empire. The officer who refused to lead would have been deemed a traitor to his troops, and would have suffered the punishment of his treason.

There is a widespread impression that the Prætorian guards at all times held the Roman empire in their hands, but its erroneousness is demonstrated by the events of the year 193. For the first time in the course of imperial history the Prætorians presumed to nominate as emperor a man who had no legions at his back. This was Pertinax, who has been well styled the Galba of his time—upright and honorable to severity, and zealous for good government, but blindly optimist about the possibilities of reform in a feeble and corrupt age. After a three months' rule he was destroyed by the power that lifted him up. According to the well-known story, true rather in its outline than in its details, the Prætorians sold the throne to Didius Julianus. But at the end of two months both the Prætorians and their nominee were swept away by the real disposers of Roman rule, the provincial legions. Four groups of legions at the time were strong enough to aspire to determine the destiny of the empire,—those quartered in Britain, in Germany, in Pannonia, in Syria. Three of the groups actually took the decisive step, and Severus in Pannonia, Pescennius Niger in Syria, Clodius Albinus in Britain, received from their troops the title of Augustus. Severus far outdid his rivals in promptness and decision. By what means we do not know, he secured the aid of the legions in Germany and of those in Illyria. These, with the forces in Pannonia, made a combination sufficiently formidable to overawe Albinus for the moment. He probably deemed that his best chance lay in the exhaustion of his competitors by an internecine struggle. At all events he received with submission an offer made by Severus, no doubt well understood by both to be politic, insincere, and temporary. Severus sent a trusted officer, who confirmed Albinus in his power and bestowed upon him the title of Cæsar, making him the nominal heir-apparent to the throne.

Before the action of Severus was known in Rome, the senate and people had shown signs of turning to Pescennius Niger, that he might deliver them from the poor puppet Didius Julianus and avenge on the Prætorians the murder of Pertinax. Having secured the coöperation or neutrality of all the forces in the western part of the empire, Severus hastened to Rome. To win the sympathy of the capital he posed as the avenger and successor of Pertinax, whose name he even added to his own, and used to the end of his reign. The feeble defences of Julianus were broken down and the Prætorians disarmed and disbanded, without a blow being struck. A new body of household troops was enrolled and organized on quite different principles from the old. In face of the senate, as Dio tells us, Severus acted for the moment like "one of the good emperors in the olden days." After a magnificent entry into the city he joined the senate in execrating the memory of Commodus, and in punishing the murderers of Pertinax, whom he honored with the most splendid funeral rites. He also encouraged the senate to pass a decree directing that any emperor or subordinate of an emperor who should put a senator to death should be treated as a public enemy. But he ominously refrained from asking the senate to sanction his accession to the throne.

The rest of Severus's reign, as it is read in the ancient histories, is in the main occupied with wars, over which we shall rapidly pass. The power wielded by Pescennius Niger, who called himself emperor, and was supposed to control one half of the Roman world, proved to be more imposing than substantial. The magnificent promises of Oriental princes were falsified as usual in the hour of need. Niger himself, as described by Dio, was the very type of mediocrity, conspicuous for no faculties, good or bad. This very character had no doubt commended him to Commodus as suited for the important command in Syria, which might have proved a source of danger in abler hands. The contest between Severus and Niger was practically decided after two or three engagements, fought by Severus's officers. The last battle, which took place at Issus, ended in the defeat and death of Niger (194). After this the emperor spent two years in successful attacks upon the peoples bordering on Syria, particularly in Adiabene and Osrhoene. Byzantium, the first of Niger's possessions to be attacked, was the last to fall, after a glorious defence.

Late in 196 Severus turned westward, to reckon with Albinus, who was well aware that the reckoning was inevitable. He was better born and better educated than Severus, but in capacity far inferior. As Severus was nearing Italy he received the news that Albinus had been declared emperor by his soldiers. The first counter-stroke of Severus was to affiliate himself and his elder son to the Antonines by a sort of spurious and posthumous adoption. The prestige of the old name, even when gained in this illegitimate way, was probably worth a good deal. Bassianus, the elder son of Severus, thereafter known as Aurelius Antoninus, was named Cæsar in place of Albinus, and was thus marked out as successor to his father. Without interrupting the march of his forces, Severus contrived to make an excursion to Rome. Here he availed himself with much subtlety of the sympathy many senators were known to have felt for Niger. Though he was so far faithful to the decree passed by his own advice that he put no senator to death, yet he banished and impoverished many whose presence or influence seemed dangerous or inconvenient to his prospects. Of the sufferers probably few had ever seen or communicated with Niger.

The collision between the forces of Severus and Albinus was the most violent that had taken place between Roman troops since the mighty contest at Philippi. The decisive engagement was fought in February of the year 197, on the plain between the Rhone and the Saône, to the north of Lyons. Dio tells us that 150,000 men fought on each side. The fortunes of Severus were, to all appearance, at one stage of the battle as hopeless as those of Julius Cæsar were for some hours during the battle of Munda. The tide was turned by the same means in both cases—by the personal conduct and bravery of the commander.

By this crowning victory Severus was released from all need for disguise, and "poured forth on the civil population all the wrath which he had been storing up

for a long time" (Dio). He particularly frightened the senate by calling himself the son of Marcus and brother of Commodus, whom he had before insulted. And he read a speech in which he declared that the severity and cruelty of Sulla, Marius, and Augustus had proved to be safer policy than the clemency of Pompey and Julius Cæsar, which had wrought their ruin. He ended with an apology for Commodus and bitter reproaches against the senate for their sympathy with his assassins. Over sixty senators were arrested, on a charge of having adhered to Albinus, and half of them were put to death. In most instances the charge was merely a pretence to enable the emperor to crush out the forward and dangerous spirits in the senate. The murderers of Commodus were punished; Commodus himself was deified; and on the monuments from this time onward Severus figures as the brother of that reproduction of all the vice and cruelty of Nero with the refinement left out.

The next years (197–202) were devoted by Severus to one of the dominant ideas of the empire from its earliest days—war against the Parthians. The results to which Trajan and Verus had aspired were now fully attained, and Mesopotamia was definitely established as a Roman province. Part of the time was spent in the exploration of Egypt, in respect of which Dio takes opportunity to say that Severus was not the man to leave anything human or divine uninvestigated. The emperor returned to enjoy a well-earned triumph, commemorated to this day by the arch in Rome which bears his name. During the six years which followed (202–208) Severus resided at Rome and gave his attention to the organization of the empire. No doubt his vigorous influence was felt to its remotest corners, but our historians desert us at this point and leave us for the most part to the important but dim and defective conclusions to be drawn from the abundant monumental records of the reign. Only two or three events in the civil history of this period are fully narrated by the ancient writers. The first of these is the festival of the Decennalia, or rejoicings in the tenth year of the emperor's reign. Contemporaneous with this festival was the marriage of Aurelius Antoninus (Caracalla) with Plautilla, the daughter of Plautianus, commander of the reorganized Prætorian guards. This officer holds a conspicuous position in the ancient accounts of the reign, yet it is all but impossible to believe a good deal that we are told concerning him. Nevertheless, without a clear view of the career of Plautianus, it is difficult to grasp definitely some important features in the character of Severus, or to appreciate exactly the nature of his government. According to Dio and Herodian, Plautianus was allowed for years to exercise and abuse the whole power of the emperor, so far as it did not relate to the actual conduct of war. He was cruel, arrogant, and corrupt; and the whole empire groaned under his exactions. Geta, the brother of Severus, tried to open the emperor's eyes, but the license of Plautianus was merely restricted for a moment, to be bestowed again in full. Finally, in 203 this second Sejanus fell a victim to an intrigue set on foot by his own son-in-law Antoninus (Caracalla), the details of which were not clearly known even to contemporary writers. It is hard to see in what way we are to reconcile this history with the known facts of Severus's character and career, unless we assume that Plautianus was really the instrument of his master for the execution of his new policy towards the senate and the senatorial provinces. That Plautianus abused his authority and brought about his own fall is probable enough,—also that Severus had destined him at one time for the guardianship of his sons. Plautianus was succeeded in his office by two men, one of whom was the celebrated jurist Papinian.

Severus spent the last three years of his life (208–211) in Britain, amidst constant and not very successful warfare, which he is said to have provoked partly to strengthen the discipline and powers of the legions, partly to wean his sons from their evil courses by hard military service. He died at York in February of the year 211. There are vague traditions that his death was in some way hastened by Caracalla. This prince had been, since about 197, nominally joint emperor with his father, so that no ceremony was needed for his recognition as monarch.

The natural gifts of Severus were of no high or unusual order. He had a clear head, promptitude, resolution, tenacity, and great organizing power, but no touch of genius. That he was cruel cannot be questioned, but his cruelty was of the calculating kind, and always clearly directed to some end. He threw the head of Niger over the ramparts of Byzantium, but merely as the best means of procuring a surrender of the stubbornly defended fortress. The head of Albinus he exhibited at Rome, but only as a warning to the capital to tamper no more with pretenders. The children of Niger were held as hostages and kindly treated so long as they might possibly afford a useful basis for negotiation with their father; when he was defeated they were killed, lest from among them should arise a claimant for the imperial power. Stern and barbarous punishment was always meted out by Severus to the conquered foe, but terror was deemed the best guarantee for peace. He felt no scruples of conscience or honor if he thought his interest at stake, but he was not wont to take an excited or exaggerated view of what his interest required. He used or destroyed men and institutions alike with cool judgment and a single eye to the main purpose of his life, the secure establishment of his dynasty. The few traces of aimless savagery which we find in the ancient narratives are probably the result of fear working on the imagination of the time.

As a soldier Severus was personally brave, but he can hardly be called a general, in spite of his successful campaigns. He was rather the organizer of victory than the actual author of it. The operations against Niger were carried out entirely by his officers. Dio even declares that the final battle with Albinus was the first at which Severus had ever been actually present. When a war was going on he was constantly travelling over the scene of it, planning it and instilling into the army his own pertinacious spirit, but the actual fighting was usually left to others. His treatment of the army is the most characteristic feature of his reign. He frankly broke with the decent conventions of the Augustan constitution, ignored the senate, and candidly based his rule upon force. The only title he ever laid to the throne was the *pronunciamiento* of the legions, whose adherence to his cause he commemorated even on the coinage of the realm. The legions voted him the adopted son of Marcus Aurelius; the legions associated with him Caracalla in the government of the empire. Severus strove earnestly to wed the army as a whole to the support of his dynasty. He increased enormously the material gains and the honorary distinctions of the service, so that he was charged with corrupting the troops. Yet it cannot be denied that, all things considered, he left the army of the empire more efficient than he found it. He increased the strength of it by three legions, and turned the Prætorians, heretofore a flabby body without military experience or instinct, into a chosen corps of veterans. Their ranks were filled by promotion from all the legions on service, whereas previously there had been special enlistment from Italy and one or two of the neighboring provinces. It was hoped that these picked men would form a force on which an emperor could rely in an emergency. But to meet the possibility of a legionary revolt in the provinces, one of the fundamental principles of the Augustan empire was abrogated: Italy became a province, and troops of the regular army were quartered in it under the direct command of the emperor. Further to obviate the risk of revolution, the great commands in the provinces were broken up, so that, excepting on the turbulent eastern frontier, it was not possible for a commander to dispose of troops numerous enough to render him dangerous to the government.

But, while the policy of Severus was primarily a family policy, he was by no means careless of the general security and welfare of the empire. Only in one instance, the destruction of Byzantium, did he weaken its defences for his own private ends—an error for which his successors paid dearly, when the Goths came to dominate the Euxine. The constantly troublesome Danubian regions received the special attention of the emperor, but all over the realm the status and privileges of communities and districts were recast in the way that seemed likely to conduce to their prosperity. The administration acquired more and more of a military character, in Italy as well as in the provinces. Retired military officers now filled many of the posts for-

merly reserved for civilians of equestrian rank. The præfect of the Prætorians received large civil and judicial powers, so that the investment of Papinian with the office was less unnatural than it at first sight seems. The alliance between Severus and the jurisconsults had important consequences. While he gave them new importance in the body politic, and coöperated with them in the work of legal reform, they did him material service by working an absolutist view of the government into the texture of Roman law. Of the legal changes of the reign, important as they were, we can only mention a few details. The emperor himself was a devoted and upright judge, but he struck a great blow at the purity of the law by transferring the exercise of imperial jurisdiction from the forum to the palace. He sharpened in many respects the law of treason, put an end to the time-honored *quaestiones perpetuae*, altered largely that important section of the law which defined the rights of the fiscus, and developed further the social policy which Augustus had embodied in the *lex Julia de adulteriis* and the *lex Papia Poppaea*.

Severus boldly adopted as an official designation the autocratic title of *dominus*, which the better of his predecessors had renounced, and with which the worse had only toyed, as Domitian, whom Martial did not hesitate to call "his lord and his god." During Severus's reign the senate was absolutely powerless; he took all initiative into his hands. He broke down the distinction between the servants of the senate and the servants of the emperor. All nominations to office or function passed under his scrutiny. The estimation of the old consular and other republican titles was diminished. The growth of capacity in the senate was effectually checked by cutting off the tallest of the poppy-heads early in the reign. The senate became a mere registration office for the imperial determinations, and its members, as has been well said, a choir for drawling conventional hymns of praise in honor of the monarch. Even the nominal restoration of the senate's power at the time of Alexander Severus, and the accession of so-called "senatorial emperors" later on, did not efface the work of Septimius Severus, which was resumed and carried to its fulfilment by Diocletian.

It only remains to say a few words of the emperor's attitude towards literature, art, and religion. No period in the history of Latin literature is so barren as the reign of Severus. Many later periods—the age of Stilicho, for example—shine brilliantly by comparison. The only great Latin writers are the Christians Tertullian and Cyprian. The Greek literature of the period is richer, but not owing to any patronage of the emperor, except perhaps in the case of Dio Cassius, who, though no admirer of Severus, attributes to encouragement received from him the execution of the great historical work which has come down to our time. The numerous restorations of ancient buildings and the many new constructions carried out by Severus show that he was not insensible to the artistic glories of the past; and he is known to have paid much attention to works of art in foreign countries where his duties took him. But he was in no sense a patron or connoisseur of art. As to religion, if we may trust Dio, one of the most superstitious of historians, Severus was one of the most superstitious of monarchs. But apart from that it is difficult to say what was his influence on the religious currents of the time. He probably did a good deal to strengthen and extend the official cult of the imperial family, which had been greatly developed during the prosperous times of the Antonines. But what he thought of Christianity, Judaism, or the Oriental mysticism to which his wife Julia Domna gave such an impulse in the succeeding reign, it is impossible to say. We may best conclude that his religious sympathies were wide, since tradition has not painted him as the partisan of any one form of worship.

The energy and dominance of Severus's character and his capacity for rule may be deemed, without fancifulness, to be traceable in the numerous representations of his features which have survived to our days.

The authorities for this emperor's reign are fairly full and satisfactory, considering the general scantiness of the imperial records. Severus himself wrote an autobiography which was regarded as candid and trustworthy on the whole. The events of the reign were recorded by several contemporaries. The first place among these must be given to Dio Cassius, who stands to the empire in much the same relation as Livy to the republic. He became a senator in the year when Marcus Aurelius died (180) and retained that dignity for more than fifty years. He was well acquainted with Severus, and was near enough the centre of affairs to know the real nature of events, without being great enough to have personal motives for warping the record. Though this portion of Dio's history no longer exists in its original form, we have copious extracts from it, made by Xiphilinus, an ecclesiastic of the 11th century. The faults which have impaired the credit of Dio's great work in its earlier portions,—his lack of the critical faculty, his inexact knowledge of the earlier Roman institutions, his passion for signs from heaven,—could do little injury to the narrative of an eye-witness; and he must here make upon the attentive reader the impression of unusual freedom from the commonest vices of history,—passion, prejudice, and insincerity. His Greek, too, stands in agreeable contrast to the debased Latin of the "scriptores historiae Augustae." The Greek writer Herodian was also a contemporary of Severus, but the mere fact that we know nothing of his life is in itself enough to show that his opportunities were not so great as those of Dio. The reputation of Herodian, who was used as the main authority for the times of Severus by Tillemont and Gibbon, has not been proof against the criticism of recent scholars. His faults are those of rhetoric and exaggeration. His narrative is probably in many places not independent of Dio. The writers known as the "scriptores historiae Augustae" are also of considerable importance,—particularly in the lives of Didius Julianus, Severus, Pescennius Niger, and Caracalla, attributed to Ælius Spartianus; those of Clodius Albinus and Opilius Macrinus to Julius Capitolinus; those of Antoninus Diadumenus, Antoninus Heliogabalus, and Alexander Severus to Lampridius. The personal history of Severus and his family is known to us mainly through these writers. Their principal authority was most probably L. Marius Maximus, a younger contemporary of Septimius Severus, who wrote, in continuation of the work of Suetonius, the lives of eleven emperors from Trajan to Heliogabalus inclusive. If we may believe a few words about him dropped by Ammianus Marcellinus, he was a kind of prose Juvenal, whose uniformly dark pigments can hardly have sufficed to paint a true picture even of his own times. The very numerous inscriptions belonging to the age of Septimius Severus enable us to control at many points and largely to supplement the literary records of his reign, particularly as regards the details of his administration. The juridical works of Justinian's epoch embody much that throws light on the government of Severus.

The principal modern works relating to this emperor, after Tillemont and Gibbon, are—J. J. Schulte, *De Imperatore L. Septimio Severo*, Münster, 1867; Höfner, *Untersuchungen zur Geschichte des Kaisers L. Septimius Severus*, Giessen, 1875; *Untersuchungen zur römischen Kaisergeschichte*, ed. by M. Budinger; H. Schiller, *Geschichte der römischen Kaiserzeit*, Gotha, 1880–83; De Ceuleneer, *Essai sur la Vie et le Règne de Septime Sévère*, Brussels, 1880; Réville, *La Religion à Rome sous les Sévères*, Paris, 1886. Controversy about the many disputed matters pertaining to Severus has been intentionally avoided in what has been said above. (J. S. R.)

SEVERUS, Marcus Aurelius Alexander, Roman emperor from 222 to 235, was of Syrian parentage, and was born at Arca near the Syrian Tripolis (now Irḳa; Yáḳút, iii. 653; *cf.* Gen. x. 17) probably in the year 205. His father Gessius Marcianus held office more than once as an imperial procurator; his mother Julia Mamæa was the daughter of Julia Mæsa, the scheming and ambitious lady of Emesa who had succeeded in raising her grandson Elagabalus to the throne of the Cæsars; see the genealogical table in Heliogabalus. His original name was Alexius Bassianus, but he changed it in 221, when Mæsa persuaded Elagabalus to adopt his cousin as successor and create him Cæsar. In the next year Elagabalus was murdered, and Alexander was proclaimed by the Prætorians and accepted by the senate. He was then a mere lad, amiable, well-meaning, but somewhat weak, and entirely under the dominion of his mother, a woman of many virtues, who surrounded her son with wise counsellors, watched over the development of his character, and improved the tone of the administration, but on the other hand was inordinately jealous of her influence, and alienated the army by extreme parsimony, while neither she nor her son had a strong enough hand to keep tight the reins of military discipline. Mutinies became frequent in all parts of the empire: to one of them the life of the prætorian præfect Ulpian was sacrificed; another compelled the retirement of Dion Cassius from his command (see Dion). On the whole, however, the reign of Alexander Severus was prosperous till he was summoned to the East to face the new power of the Sásánians (see Persia, vol. xviii. p. 618). Of the war that followed we have very various accounts; Mommsen (vol. v. p. 420 *sq.*) leans to that which is least favorable to the Romans. At all events, though the Persians were checked for the time, the conduct of the Roman army showed an extraordinary lack of discipline. The emperor returned to Rome and celebrated a triumph (233), but next year he was called to face German invaders in Gaul, and there was slain with his mother in a mutiny which was probably led by Maximinus, and at any rate purchased him the throne. Whatever the personal virtues of Alexander were, and they have not lost by contrast with his successor's brutal tyranny, he was not of the stuff to rule a military empire.

SEVERUS, Sulpicius (*c.* 365–*c.* 425), early Chris-

tian writer. A native of Aquitania, he was thoroughly imbued with the culture of his country and time. The seven southern provinces of Gaul, between the Alps and the Loire, had long been completely Romanized. The very name "Gaul" was repudiated by the inhabitants, and confined to the natives of the ruder northern districts. The lifetime of Severus exactly coincided with the period of greatest literary development in Aquitania, then the truest or only true home of Latin letters and learning—their last place of refuge, from which Severus saw them driven before he closed his eyes on the world. Almost all that we know of his life comes from a few allusions in his own writings and some passages in the letters of his friend Paulinus, bishop of Nola. In his early days he was famous as a pleader in the courts, and his knowledge of Roman law is reflected in parts of his writings. He married a wealthy lady belonging to a consular family, who died young, leaving him no children. At this time Severus came under the powerful influence of St. Martin, bishop of Tours, by whom he was led to devote his wealth to the Christian poor, and his own powers to a life of good works and meditation. To use the words of his friend Paulinus, he broke with his father, followed Christ, and set the teachings of the "fishermen" far above all his "Tullian learning." He rose to no higher rank in the church than that of presbyter. His time was passed chiefly in the neighborhood of Toulouse, and such literary efforts as he permitted to himself were made in the interests of Christianity. In many respects no two men could be more unlike than Severus, the scholar and orator, well versed in the ways of the world, and Martin, the rough Pannonian bishop of Tours, ignorant of learning, suspicious of culture, the champion of the monastic life, the seer of visions, and the worker of miracles. Yet the spirit of the rugged saint subdued that of the polished scholar, and the works of Severus would have little importance now did they not reflect the ideas, influence, and aspirations of Martin, the foremost ecclesiastic of Gaul, and one of the most striking figures in the church of his day.

The chief work of Severus is the *Chronica*, a summary of sacred history from the beginning of the world to his own times, with the omission of the events recorded in the Gospels and the Acts, "lest the form of his brief work should detract from the honor due to those events." The book was in fact a text-book, and was actually used as such in the schools of Europe for about a century and a half after the *editio princeps* was published by Flacius Illyricus in 1556. Severus nowhere clearly points to the class of readers for whom his book is designed. He disclaims the intention of making his work a substitute for the actual narrative contained in the Bible. "Worldly historians" had been used by him, he says, to make clear the dates and the connection of events and for supplementing the sacred sources, and with the intent at one and the same time to instruct the unlearned and to "convince" the learned. Probably the "unlearned" are the mass of Christians, and the learned are the cultivated Christians and pagans alike, to whom the rude language of the sacred texts, whether in their Greek or their Latin form, would be distasteful. The literary structure of the narrative itself shows that Severus had in his mind principally readers on the same level of culture with himself. He was anxious to show that sacred history might be presented in a form which lovers of Sallust and Tacitus could appreciate and enjoy. The style is lucid and almost classical. Though phrases and even sentences from many classical authors are interwoven here and there, the narrative flows on easily, with no trace of the jolts and jerks which offend us in almost every line of a patchwork imitator of the classics like Sidonius. In order that his work might fairly stand beside that of the old Latin writers, Severus boldly ignored the allegorical methods of interpreting sacred history to which the heretics and the orthodox of the age were alike wedded. Possibly he was not unshaken in his adherence to the peculiar reading which nearly all men then gave to the maxim that "the letter killeth but the spirit maketh alive."

As an authority for times antecedent to his own, Severus is of little moment. At only a few points does he enable us to correct or supplement other records. Bernays has shown that he based his narrative of the destruction of Jerusalem by Titus on the account given by Tacitus in his "Histories," a portion of which has been lost. We are enabled thus to contrast Tacitus with Josephus, who warped his narrative to do honor to Titus. In his allusions to the Gentile rulers with whom the Jews came into contact from the time of the Maccabees onwards, Severus discloses some points which are not without importance. But the real interest of his work lies, first, in the incidental glimpses it affords all through of the history of his own time; next, and more particularly, in the information he has preserved concerning the struggle over the Priscillianist heresy, which disorganized and degraded the churches of Spain and Gaul, and particularly affected Aquitaine. The sympathies here betrayed by Severus are wholly those of St. Martin. The stout bishop had withstood to his face Maximus, who ruled for some years a large part of the western portion of the empire, though he never conquered Italy. He had reproached him with attacking and overthrowing his predecessors on the throne, and for his dealings with the church. Severus loses no opportunity presented by his narrative for laying stress on the crimes and follies of rulers and on their cruelty, though he once declares that, cruel as rulers could be, priests could be crueller still. This last statement has reference to the bishops who had left Maximus no peace till he had stained his hands with the blood of Priscillian and his followers. Martin, too, had denounced the worldliness and greed of the Gaulish bishops and clergy. Accordingly we find that Severus, in narrating the division of Canaan among the tribes, calls the special attention of ecclesiastics to the fact that no portion of the land was assigned to the tribe of Levi lest they should be hindered in their service of God. "Our clergy seem," he says, "not merely forgetful of the lesson but ignorant of it, such a passion for possessions has in our days fastened like a pestilence on their souls. They are greedy of property, and tend their estates and hoard their gold, and buy and sell and give their minds to gain. Those of them who are reputed to be of better principles, who neither hold property nor barter, sit and wait for gifts, and pollute all the grace of their lives by taking fees, while they almost make market of their holiness; but I have digressed farther than I intended, through vexation and weariness of the present age." We here catch an interesting glimpse of the circumstances which were winning over good men to monasticism in the West, though the evidence of an enthusiastic votary of the solitary life, such as Severus was, is probably not free from exaggeration. Severus also fully sympathized with the action of St. Martin touching Priscillianism. This mysterious Western offshoot of Gnosticism had no single feature about it which could soften the hostility of a character such as Martin's was, but he stanchly resisted the introduction of secular punishment for evil doctrine, and withdrew from communion with those bishops in Gaul, a large majority, who invoked the aid of Maximus against their erring brethren. In this connection it is interesting to note the account given by Severus of the synod held at Rimini in 359, when the question arose whether the bishops attending the assembly might lawfully receive money from the imperial treasury to recoup their travelling and other expenses. Severus evidently approves the action of the British and Gaulish bishops, who deemed it unbecoming that they should lie under pecuniary obligation to the emperor. His ideal of the church required that it should stand clear of and above the state.

After the *Chronica* the chief work of Severus is his *Life of Martin*, a contribution to popular Christian literature which did much to establish the great reputation which that wonder-working saint maintained throughout the Middle Ages. The book is not properly a biography, but a catalogue of miracles, told in all the simplicity of absolute belief. The power to work miraculous signs is assumed to be in direct proportion to holiness, and is by Severus valued merely as an evidence of holiness, which he is persuaded can only be attained through a life of isolation from the world. In the first of his dialogues Severus puts into the mouth of an interlocutor a most pleasing description of the life of cœnobites and solitaries in the deserts bordering on Egypt. The main evidence of the virtue attained by them lies in the voluntary subjection to them of the savage beasts among which they lived. But Severus was no indiscriminating adherent of monasticism. The same dialogue shows him to be alive to its dangers and defects. The second dialogue is a large appendix to the Life of Martin, and really supplies more information of his life as bishop and of his views than the work which bears the title *Vita S. Martini*. The two dialogues occasionally make interesting references to personages of the epoch. In Dial. 1, cc. 6, 7, we have a vivid picture of the controversies which raged at Alexandria over the works of Origen. The judgment of Severus himself is no doubt that which he puts in the mouth of his

interlocutor Postumianus: "I am astonished that one and the same man could have so far differed from himself that in the approved portion of his works he has no equal since the apostles, while in that portion for which he is justly blamed it is proved that no man has committed more unscemly errors." Three epistles complete the list of Severus's genuine works. He is said to have been led away in his old age by Pelagianism, but to have repented and inflicted long-enduring penance on himself.

The text of the *Chronica* rests on a single MS., one of the Palatine collection now in the Vatican; of the other works MSS. are abundant. Some spurious letters bear the name of Severus; also in a manuscript at Madrid is a work falsely professing to be an epitome of the *Chronica* of Severus, and going down to 511. The chief editions of the complete works of Severus are those by De Prato (Verona, 1741) and by Halm (forming vol. i. of the *Corpus Scriptorum Ecclesiasticorum Latinorum*, Vienna, 1866). There is a most admirable monograph on the *Chronica* by Bernays (Berlin, 1861). (J. S. R.)

SÉVIGNÉ, Marie de Rabutin-Chantal, Marquise de (1626–1696), the most charming of all letter-writers in all languages, was born at Paris on February 6, 1626, and died at the chateau of Grignan (Drôme), on April 18, 1696. The family of Rabutin (if not so illustrious as Bussy, Madame de Sévigné's notorious cousin, affected to consider it) was one of great age and distinction in Burgundy. It was traceable in documents to the 12th century, and the castle which gave it name still existed, though in ruins, in Madame de Sévigné's time. The family had been "gens d'épée" for the most part, though François de Rabutin, the author of valuable memoirs on the 6th decade of the 16th century, undoubtedly belonged to it. It is said that Bussy's silly vanity led him to exclude this François from the genealogy of his house because he had not occupied any high position. Marie's father, Celse Bénigne de Rabutin, Baron de Chantal, was the son of the celebrated "Sainte" Chantal, friend and disciple of St. Francis of Sales; her mother was Marie de Coulanges. Celse de Rabutin shared to the full the mania for duelling which was the curse of the gentlemen of France during the first half of the 17th century, and was frequently in danger both directly from his adversaries and indirectly from the law. He died, however, in a more legitimate manner, being killed during the English descent on the Isle of Rhé in July, 1627. His wife did not survive him many years, and Marie was left an orphan at the age of seven years and a few months. She then passed into the care of her grandparents on the mother's side; but they were both aged, and the survivor of them, Philippe de Coulanges, died in 1636, Marie being then ten years old. According to French custom a family council was held to select a guardian of the young heiress, for such she was to some extent. Her uncle Christophe de Coulanges, Abbé de Livry, was chosen. He was somewhat young for the guardianship of a girl, being only twenty-nine, but readers of his niece's letters know how well "Le Bien Bon"—for such is his name in Madame de Sévigné's little language—acquitted himself of the trust. He lived till within ten years of his ward's death, and long after his nominal functions were ended he was in all matters of business the good angel of the family, while for half a century his abbacy of Livry was the favorite residence, both of his niece and her daughter. Coulanges was much more of a man of business than of a man of letters, but either choice or the fashion of the time induced him to make of his niece a learned lady. Chapelain and Ménage are specially mentioned as her tutors, and Ménage at least fell in love with her, in which point he resembled the rest of the world, and was constant to his own habits in regard to his pupils. Tallemant des Réaux gives more than one instance of the cool and good-humored raillery with which she received his passion, and the earliest letters of hers that we possess are addressed to Ménage. Another literary friend of her youth was the poet Saint-Pavin. Among her own sex she was intimate with all the coterie of the Hôtel Rambouillet, and her special ally was Mademoiselle de la Vergne, afterwards Madame de la Fayette. In person she was extremely attractive, though the minute critics of the time (which was the palmy day of portraits in words) objected to her divers deviations from strictly regular beauty, such as eyes of different colors and sizes, a "square-ended" nose, and a somewhat heavy jaw. Her beautiful hair and complexion, however, were admitted even by these censors, as well as the extraordinary spirit and liveliness of her expression. Her long minority, under so careful a guardian as Coulanges, had also raised her fortune to the amount of 100,000 crowns [$57,000]—a large sum for the time, and one which with her birth and beauty might have allowed her to expect a very brilliant marriage. That which she finally made was certainly one of affection on her side rather than of interest. There had been some talk of her cousin Bussy, but very fortunately for her this came to nothing. She actually married Henri, Marquis de Sévigné, a Breton gentleman of a good family, and allied to the oldest houses of that province, but of no great estate. The marriage took place on August 4, 1644, and the pair went almost immediately to Sévigné's manor-house of Les Rochers, near Vitré, a place which Madame de Sévigné was in future years to immortalize. It was an unfortified chateau of no very great size, but picturesque enough, with the peaked turrets common in French architecture, and surrounded by a park and grounds of no large extent, but thickly wooded and communicating with other woods. The abundance of trees gave it the repute of being damp and somewhat gloomy. Fond, however, as Madame de Sévigné was of society, it may be suspected that the happiest days of her brief married life were spent there. For there at any rate her husband had less opportunity than in Paris of neglecting her, and of wasting her money and his own. Very little good is said of Henri de Sévigné by any of his contemporaries. He was one of the innumerable lovers of Ninon de l'Enclos, and made himself even more conspicuous with a certain Madame de Gondran, known in the nickname slang of the time as "La Belle Lolo." He was wildly extravagant. That his wife loved him and that he did not love her was generally admitted, and the frank if somewhat coxcomb-like accounts which Bussy Rabutin gives of his own attempt and failure to persuade her to retaliate on her husband are decisive as to her virtue. At last Sévigné's pleasant vices came home to him. He quarrelled with the Chevalier d'Albret about Madame de Gondran, fought with him and was mortally wounded on the 4th of February, 1651; he died two days afterwards. There is no reasonable doubt that his wife regretted him a great deal more than he deserved. On two different occasions she is said to have fainted in public at the sight once of his adversary and once of his second in the fatal duel; and whatever Madame de Sévigné was (and she had several faults) she was certainly not a hypocrite. Her husband had when living accused her of coldness,—the common excuse of libertine husbands,—but even he seems to have found fault only with her temperament, not with her heart. To close this part of the subject it may be said that though only six and twenty, and more beautiful than ever, she never married again despite frequent offers, and that no aspersion was ever thrown save in one instance on her fame. For the rest of her life, which was long, she gave herself up to her children. These were two in number, and they divided their mother's affections by no means equally. The eldest was a daughter, Françoise Marguerite de Sévigné, who was born on October 10, 1646, whether at Les Rochers or in Paris is not absolutely certain. The second, a son, Charles de Sévigné, was born at Les Rochers in the spring of 1648. To him Madame de Sévigné was an indulgent, a generous (though not altogether just), and in a way an affectionate mother. Her daughter, the future Madame de Grignan, she worshipped with an almost insane affection, which only its charming literary results and the delightful qualities which accompanied it in

the worshipper, though not in the worshipped, save from being ludicrous if not revolting. As it is, not one in a hundred of Madame de Sévigné's readers can find in his heart to be angry with her for her devotion to a very undivine divinity.

After her husband's death Madame de Sévigné passed the greater part of the year 1651 in retirement at Les Rochers. She had, however, no intention of renouncing the world, and she returned to Paris in November of that year, her affairs having been put in such order as Sévigné's extravagance permitted by the faithful Coulanges. For nearly ten years little of importance occurred in her life, which was passed at Paris in a house she occupied in the Place Royale (not as yet in the famous Hôtel Carnavalet), at Les Rochers, at Livry, or at her own estate of Bourbilly in the Mâconnais. She had, however, in 1658 a quarrel with her cousin Bussy, which had not unimportant results, and at the end of the time mentioned above she narrowly escaped being compromised in reputation, though not politically, at Fouquet's downfall. Notwithstanding Bussy's unamiable character and the early affair of the proposed marriage, and notwithstanding also his libertine conduct towards her, the cousins had always been friends; and the most amusing and characteristic part of Madame de Sévigné's correspondence, before the date of her daughter's marriage, is addressed to him. She had a very strong belief in family ties; she recognized in Bussy a kindred spirit, and she excused his faults as *Rabutinades* and *Rabutinages*—the terms she uses in alluding to the rather excitable and humorist temper of the house. But in 1658 a misunderstanding about money brought about a quarrel, which in its turn had a long sequel, and results not unimportant in literature. Bussy and his cousin had jointly come in for a considerable legacy, and he asked her for a loan. If this was not positively refused, there was a difficulty made about it, and Bussy was deeply offended. A year later, at the escapade of Roissy (see RABUTIN), according to his own account, he improvised (according to probability he had long before written it) the famous portrait of Madame de Sévigné which appears in his notorious *Histoire Amoureuse*, and which is a triumph of malice. Circulated at first in manuscript and afterwards in print, this caused Madame de Sévigné the deepest pain and indignation, and the quarrel between the cousins was not fully made up for years, if indeed it was ever fully made up. This portrait, however, was more wounding to self-love than in any way really dangerous, for, read between the lines, it is in effect a testimonial of character. The Fouquet matter was more serious. The superintendent was a famous lady-killer, but Madame de Sévigné, though he was her friend, and though she had been ardently courted by him as by others (one quarrel in her presence between the Duke de Rohan and the Marquis de Tonquedec had become notorious), had hitherto escaped scandal. At Fouquet's downfall in 1661 it was announced on indubitable authority that communications from her had been found in the coffer where Fouquet kept his love letters. She protested that the notes in question were of friendship merely, and Bussy (one of the not very numerous good actions of his life) obtained from Le Tellier, who as minister had examined the letters, a corroboration of the protest. But the letters were never published, and there have always been those who held that Madame de Sévigné regarded Fouquet with at least a very warm kind of friendship. It is certain that her letters to Pomponne describing his trial are among her masterpieces of unaffected, vivid, and sympathetic narration.

During these earlier years, besides the circumstances already mentioned, Madame de Sévigné conceived, like most of the better and more thoughtful among Frenchmen and Frenchwomen, a great affection for the establishment of Port Royal, which was not without its effect on her literary work. That work, however (if writing than which certainly none was ever less carried out in a spirit of mere workmanship can be so called), dates in its bulk and really important part almost entirely from the last thirty years of her life. Her letters before the marriage of her daughter, though by themselves they would suffice to give her a very high rank among letter-writers, would not do more than fill one moderate-sized volume. Those after that marriage fill nearly ten large volumes in the latest and best edition. We do not hear very much of Mademoiselle de Sévigné's early youth. For a short time, at a rather uncertain date, she was placed at school with the nuns of St. Marie at Nantes. But for the most part her mother brought her up herself, assisted by the Abbé de la Mousse, a faithful friend, and for a time one of her most constant companions. La Mousse was a great Cartesian, and he made Mademoiselle de Sévigné also a devotee of the bold soldier of Touraine to a degree which even in that century of blue stockings excited surprise and some ridicule. But Mademoiselle de Sévigné was bent on more mundane triumphs than philosophy had to offer. Her beauty is all the more incontestable that she was by no means generally liked. Bussy, a critical and not too benevolent judge, called her "la plus jolie fille de France," and it seems to be agreed that she resembled her mother, with the advantage of more regular features. She was introduced at court early, and as she danced well she figured frequently in the ballets which were the chief amusement of the court of Louis XIV. in its early days. If, however, she was more regularly beautiful than her mother she had little or nothing of her attraction, and like many other beauties who have entered society with similar expectations she did not immediately find a husband. Various projected alliances fell through for one reason or another, and it was not till the end of 1668 that her destiny was settled. On January 29 in the next year she married François Adhémar, Comte de Grignan, a Provençal, of one of the noblest families of France, and a man of amiable and honorable character, but neither young nor handsome, nor in reality rich. He had been twice married and his great estates were heavily encumbered. Neither did the large dowry (300,000 livres [or $57,000]) which Madame de Sévigné, somewhat unfairly to her son, bestowed upon her daughter, suffice to clear encumbrances, which were constantly increased in the sequel by the extravagance of Madame de Grignan as well as of her husband.

Charles de Sévigné was by this time twenty years old, but he had no doubt already learnt that he was not the person of chief importance in the family. He never, throughout his life, appears to have resented his mother's preference of his sister; but, though thoroughly amiable, he was not (at any rate in his youth) a model character. Nothing is known of his education, but just before his sister's marriage he volunteered for a rather harebrained expedition to Crete against the Turks, and served with credit. Then his mother bought him the commission of *guidon* (a kind of sub-cornet) in the Gendarmes Dauphin, in which regiment he served for some years, and after long complaining of the slowness of promotion rather rapidly rose to the rank of captain, when he sold out. But though he always fought well he was not an enthusiastic soldier, and was constantly and not often fortunately in love. He followed his father into the nets of Ninon de l'Enclos, and was Racine's rival with Mademoiselle Champmeslé. The way in which his mother was made confidante of these discreditable and not very successful loves is characteristic both of the time and of the country. In 1669 M. de Grignan, who had previously been lieutenant-governor of Languedoc, was transferred to Provence. The governor-in-chief was the young duke of Vendôme. But at this time he was a boy, and he never really took up the government, so that Grignan for more than forty years was in effect viceroy of this important province. His wife rejoiced greatly in the part of vice-queen;

but their peculiar situation threw on them the expenses, without the emoluments of the office, and those expenses were increased by the extravagance of both, so that the Grignan money affairs hold a larger place in Madame de Sévigné's letters than might perhaps be wished.

In 1671 Madame de Sévigné with her son paid a visit to Les Rochers, which is memorable in her history and in literature. The states of Brittany were convoked that year at Vitré. This town being in the immediate neighborhood of Les Rochers, Madame de Sévigné's usually quiet life at her country house was diversified by the necessity of entertaining the governor, the Duc de Chaulnes, of appearing at his receptions, and so forth. All these matters are duly consigned to record in her letters, together with much good-natured raillery (it must be admitted that it is sometimes almost on the verge of being ill-natured, though never quite over it) on the country ladies of the neighborhood and their ways. She remained at Les Rochers during the whole summer and autumn of 1671, and did not return to Paris till late in November. The country news is then succeeded by news of the court. At the end of the next year, 1672, one great wish of her heart was gratified by paying a visit to her daughter in her vice-royalty of Provence. Madame de Grignan does not seem to have been very anxious for this visit,—perhaps because, as the letters show in many cases, the exacting affection of her mother was somewhat too strong for her own colder nature, perhaps because she feared such a witness of the ruinous extravagance which characterized the Grignan household. But her mother remained with her for nearly a year, and did not return to Paris till the end of 1673. During this time we have (as is usually the case during these Provençal visits and the visits of Madame de Grignan to Paris) some letters addressed to Madame de Sévigné, but comparatively few from her. A visit of the second class was the chief event of 1674, and the references to this, such as they are, is the chief evidence that mother and daughter were on the whole better apart. 1675 brought with it the death of Turenne (of which Madame de Sévigné has given a very noteworthy account, characteristic of her more ambitious but not perhaps her more successful manner), and also serious disturbances in Brittany. Notwithstanding these it was necessary for Madame de Sévigné to make her periodical visit to Les Rochers. She reached the house in safety, and the friendship of Chaulnes protected her both from violence and from the exactions which the miserable province underwent as a punishment for its resistance to excessive and unconstitutional taxation. No small part of her letters is occupied by these affairs.

The year 1676 saw several things important in Madame de Sévigné's life. For the first time she was seriously ill,—it would appear with rheumatic fever,—and she did not thoroughly recover till she had visited Vichy. Her letters from this place are among her very best, and picture life at a 17th-century watering-place with unsurpassed vividness. In this year, too, took place the trial and execution of Madame de Brinvilliers. This event figures in the letters, and the references to it are among those which have given occasion to unfavorable comments on Madame de Sévigné's character—comments which, with others of the kind, will be more conveniently treated together. In the next year, 1677, she moved into the Hôtel Carnavalet, a house which still remains and is inseparably connected with her memory, and she had the pleasure of welcoming the whole Grignan family to it. They remained there a long time; indeed nearly two years seem to have been spent by Madame de Grignan partly in Paris and partly at Livry. The return to Provence took place in October, 1678, and next year Madame de Sévigné had the grief of losing La Rochefoucauld, the most eminent and one of the most intimate of her close personal friends and constant associates. In 1680 she again visited Brittany, but the close of that year saw her back in Paris to receive another and even longer visit from her daughter, who remained in Paris for four years. Before the end of the last year of this stay (in February, 1684), Charles de Sévigné, after all his wandering loves, and after more than one talked-of alliance, was married to a young Breton lady, Jeanne Marguerite de Mauron, who had a considerable fortune. In the arrangements for this marriage Madame de Sévigné practically divided all her fortune between her children (Madame de Grignan of course receiving an unduly large share), and reserved only part of the life interest. The greed of Madame de Grignan nearly broke her brother's marriage, but it was finally concluded and proved a very happy one in a somewhat singular fashion. Both Sévigné and his wife became deeply religious, and at first Madame de Sévigné found their household (for she gave up Les Rochers to them) not at all lively. But by degrees she grew fond of her daughter-in-law. During this year she spent a considerable time in Brittany, first on business, afterwards on a visit to her son, and partly it would appear for motives of economy. But Madame de Grignan still continued with only short absences to inhabit Paris, and the mother and daughter were practically in each other's company until 1688. The proportion of letters therefore that we have for the decade 1677–1687 is much smaller than that which represents the decade preceding it; indeed the earlier period contains the great bulk of the whole correspondence. In 1687 the Abbé de Coulanges, Madame de Sévigné's uncle and good angel, died, and in the following year the whole family were greatly excited by the first campaign of the young Marquis de Grignan, Madame de Grignan's only son, who was sent splendidly equipped to the siege of Philippsbourg. In the same year Madame de Sévigné was present at the St. Cyr performance of *Esther*, and some of her most amusing descriptions of court ceremonies and experiences date from this time. 1689 and 1690 were almost entirely spent by her at Les Rochers with her son; and on leaving him she went across France to Provence. There was some excitement during her Breton stay, owing to the rumor of an English descent, on which occasion the Breton militia was called out, and Charles de Sévigné appeared for the last time as a soldier; but it came to nothing. 1691 was passed at Grignan and other places in the south, but at the end of it Madame de Sévigné returned to Paris, bringing the Grignans with her; and her daughter stayed with her till 1694. The year 1693 saw the loss of two of her oldest friends,—Bussy Rabutin, her faithless and troublesome but in his own way affectionate cousin, and Madame de la Fayette, her lifelong companion, and on the whole perhaps her best and wisest friend. Another friend almost as intimate, Madame de Lavardin, followed in 1694. Madame de Sévigné spent but a few months of this latter year alone, and followed her daughter to Provence. She never revisited Brittany after 1691. Two important marriages with their preparations occupied most of her thoughts during 1694–1695. The young Marquis de Grignan married the daughter of Saint-Amant, an immensely rich financier; but his mother's pride, ill-nature, and bad taste (she is said to have remarked in full court that it was necessary now and then to "manure the best lands," referring to Saint-Amant's wealth, low birth, and the Grignan's nobility) made the marriage not a very happy one. His sister Pauline, who, in the impossibility of dowering her richly, had a narrow escape of the cloister, made a marriage of affection with M. de Simiane, and eventually became the sole representative and continuator of the families of Grignan and Sévigné.

Madame de Sévigné survived these alliances but a very short time. During an illness of her daughter she herself was attacked by smallpox in April, 1696,

and she died on the 17th of that month at Grignan, and was buried there. Her idolized daughter was not present during any time of her illness; it has been charitably hoped that she was too ill herself. Her known attention to her own good looks, and the terror of the smallpox which then prevailed, supply perhaps a less charitable but sufficient explanation. But in her will Madame de Sévigné still showed her preference for this not too grateful child, and Charles de Sévigné accepted his mother's wishes in a letter showing the good-nature which he had never lacked, and the good sense which, after his early follies, and even in a way during them, he had also shown. But the two families were, except as has been said for Madame de Simiane and her posterity, to be rapidly broken up. Charles de Sévigné and his wife had no children, and he himself, after occupying some public posts (he was king's lieutenant in Brittany in 1697), went with his wife into religious retirement at Paris in 1703, and after a time sequestered himself still more in the seminary of Sainte-Magloire, where he died on March 26, 1713. His widow survived him twenty years. Madame de Grignan had died on August 16, 1705, at a country house near Marseilles, of the very disease which she had tried to escape by not visiting her dying mother. Her son, who had fought at Blenheim, had died of the same malady at Thionville the year before. Marie Blanche, her eldest daughter, was in a convent, and, as all the Comte de Grignan's brothers had either entered the church or died unmarried, the family, already bankrupt in fortune, was extinguished in the male line by Grignan's own death in 1714, at a very great age. Madame de Simiane, whose connection with the history of the letters is important, died in 1737.

The chief subjects of public interest and the principal family events of importance which are noticed in the letters of Madame de Sévigné have been indicated already. But, as will readily be understood, neither the whole nor even the chief interest of her correspondence is confined to such things. In the latest edition the letters extend to sixteen or seventeen hundred, of which, however, a considerable number (perhaps a third) are replies of other persons or letters addressed to her, or letters of her family and friends having more or less connection with the subjects of her correspondence. As a rule her own letters, especially those to her daughter, are of great length. Writing as she did in a time when newspapers were not, or at least were scanty and jejune, gossip of all sorts appears among her subjects, and some of her most famous letters are pure *reportage* (to use a modern French slang term), while others deal with strictly private subjects. Thus one of her best known pieces has for subject the famous suicide of the great cook Vatel owing to the misunderstanding as to the provision of fish for an entertainment given to the king by Condé at Chantilly. Another (one of the most characteristic of all) deals with the projected marriage of Lauzun and Mademoiselle de Montpensier; another with the refusal of one of her own footmen to turn haymaker when it was important to get the crop in at Les Rochers; another with the fire which burnt out her neighbor's house in Paris. At one moment she tells how a forward lady of honor was disconcerted in offering certain services at Mademoiselle's levée; at another how ill a courtier's clothes became him. She enters, as has been said, at great length into the pecuniary difficulties of her daughter; she tells the most extraordinary stories of the fashion in which Charles de Sévigné sowed his wild oats; she takes an almost ferocious interest and side in her daughter's quarrels with rival beauties or great officials in Provence who throw difficulties in the way of government.

Almost all writers of literary letters since Madame de Sévigné's days, or rather since the publication of her correspondence, have imitated her more or less directly, more or less consciously, and it is therefore only by applying that historic estimate upon which all true criticism rests that her full value can be discerned. The charm of her work is, however, so irresistible that, read even without any historical knowledge and in the comparatively adulterated editions in which it is generally met with, that charm can hardly be missed. Madame de Sévigné was a member of the strong and original group of writers—Retz, La Rochefoucauld, Corneille, Pascal, St. Evremond, Descartes, and the rest—who escaped the finical and weakening reforms of the later 17th century, while for the most part they had profited by those earlier reforms which succeeded the classicizing of the Pléiade and the imitation of Spanish and Italian which marred some early work of Louis XIII.'s time. According to the strictest standard of the Academy her phraseology is sometimes incorrect, and it occasionally shows traces of the quaint and affected style of the *Précieuses;* but these things only add to its savor and piquancy. In lively narration few writers have excelled her, and in the natural expression of domestic affection and maternal affection none. She had an all-observant eye for trifles and the keenest possible appreciation of the ludicrous, together with a hearty relish for all sorts of amusements, pageants, and diversions, and a deep though not voluble or over-sensitive sense of the beauties of nature. But with all this she had an understanding as solid as her temper was gay. Unlike her daughter she was not a professed blue-stocking or philosophess. But she had a strong affection for theology, in which she inclined (like the great majority of the religious and intelligent laity of her time in France) to the Jansenist side. Her favorite author in this class was Nicole. She has been reproached with her fondness for the romances of Mlle. de Scudéry and the rest of her school. But probably many persons who make that reproach have themselves never read the works they despise, and are ignorant how much merit there is in books whose chief faults are that they are written in a strongly marked and now obsolete fashion, and that their length (which, however, scarcely if at all exceeds that of *Clarissa*) is preposterous. In purely literary criticism Madame de Sévigné, few as were the airs she gave herself, was no mean expert. Her preference for Corneille over Racine has much more in it than the fact that the elder poet had been her favorite before the younger began to write; and her remarks on La Fontaine and some other authors are both judicious and independent. Nor is she wanting in original reflections of no ordinary merit. All these things, added to her abundance of amusing matter and the charm of her bright and ceaseless flowing style, fully account for the unchanged and undiminished delight which half a dozen generations have taken in her work. But it cannot be repeated too often that to enjoy that work in its most enjoyable point—the combination of fluent and easy style with quaint archaisms and tricks of phrase—it must be read as she wrote it, and not in the trimmed and corrected version of Perrin and Madame de Simiane.

There can, moreover, be no one, however wedded he may be to the plan of criticising literature as literature, who will not admit that great part of the interest and value of these remarkable works lies in the picture of character which they present. Indeed, great part of their purely literary merit lies in the extraordinary vividness of this very presentation. Madame de Sévigné's character, however, has not united quite such a unanimity of suffrage as her ability in writing. In her own time there were not wanting enemies (indeed her unsparing partisanship on her daughter's side could not fail to provoke such) who maintained that her letters were written for effect, and that her affection for her daughter was ostentatious and unreal. But few modern critics have followed these detractors, and it may be said confidently that no competent judge of character, after patiently reading the letters, can for a moment admit their view. But this kind of enemy has been followed by another, who, not overshooting his mark so conspicuously, has been somewhat more successful in persuading spectators that he has hit it. Her excessive affection for Madame de Grignan (the almost importunate character of which seems to be proved by her own confessions of unhappiness if not of quarrel when they were together); her unhesitating blindness to anything but her daughter's interest (manifested especially in the part she took in most unjustifiable attempts of Madame de Grignan to secure her stepdaughters' dowries and to force themselves into a convent); her culpable tolerance of her son's youthful follies on the one hand and the uneven balance which she held in money matters between him and his sister on the other; the apparent levity with which she speaks of the sufferings of Madame de Brinvilliers, of galley slaves, of the peasantry, etc.; and the freedom of language which she uses herself and tolerates from others,—have all been cast up against her. Here the before-mentioned historic estimate sufficiently disposes of some of the objections, a little common sense of others, and a very little charity of the rest. If too much love felt by a mother towards a daughter be a fault, then certainly Madame de Sévigné was one of the most offending souls that ever lived; but it will hardly, even with the injustice which like all excessive affection it brought in its train, be held damning. Indeed, the guilty lady was evidently quite aware of her weakness in this respect, and it is one of

the most noteworthy things of her literary capacity that, excessive as the weakness is, it does not disgust or weary the reader. The singular confidences which Madame de Sévigné received from her son and transmitted to her daughter would even at the present day be less surprising in France than in England. They are only an instance, adjusted to the manners of the time, of the system of sacrificing everything to the maintenance of confidence between mother and son, to which the almost invariable, and to foreigners sometimes rather ludicrous, but certainly not unamiable, adoration of Frenchmen for their mothers is due. Here too, as well as in reference to the immediately kindred charge of crudity of language, and to that of want of sympathy with suffering, especially with the sufferings of the people, it is especially necessary to remember of what generation Madame de Sévigné was and what were her circumstances. That generation was the generation which Madame de Rambouillet endeavored with some success to polish and humanize, but which had barely recovered the hardening influences of the religious and civil wars when it was plunged into the Fronde. It was the generation to which belong the almost incredible yet trustworthy *Historiettes* of Tallemant, and in which, when she herself had already reached middle life, Bussy Rabutin's *Histoire Amoureuse* exposed him indeed to powerful resentments but did not make him lose all caste as a gentleman and man of honor. It is absurd to expect at such a time and in private letters the delicacy proper to quite different times and circumstances. Moreover, as to the charge of inhumanity, not only do these considerations apply, but there is more to be pleaded than mere extenuating circumstances. It is not true that Madame de Sévigné shows no sympathy with the oppression of the Bretons; it is very far from true, though her incurable habit of humorous expression—of *Rabutinage*, as she says—makes her occasionally use light phrases about the matter. But it is in fact as unreasonable to expect modern political views from her (and it is from certain modern political standpoints that the charge is usually made) as it is to expect her to observe the canons of a 19th-century propriety. On the whole she may be as fairly and confidently acquitted of any moral fault, save the one peccadillo of loving her daughter too exclusively and blindly, as she may be acquitted of all literary faults whatsoever. Her letters are wholly, what her son-in-law said of her after her death, *compagnons délicieux;* and, far from faultless as Madame de Grignan was, none of her faults is more felt by the reader than her long visits to her mother, during which the letters ceased.

The bibliographic history of Madame de Sévigné's letters is of considerable interest in itself, and is moreover typical of much other contemporary literary history. The 17th century was *par excellence* the century of privately circulated literature, and from Madame de Sévigné herself we know that her own letters were copied and handed about, sometimes under specified titles, as early as 1673. None of them, however, were published until her correspondence with Bussy Rabutin appeared, in his *Memoirs and Correspondence*, partly in the year of her death, partly next year. The remainder were not printed in any form for thirty years. Then between 1725 and 1728 appeared no less than seven unauthorized editions, containing more or fewer additions from the copies which had been circulated privately. The bibliography of these is complicated and curious, and must be sought in special works (see especially the *Grands Écrivains* edition, vol. xi.). They have, however, abiding interest chiefly because they stirred up Madame de Simiane, the writer's only living representative, to give an authorized version. This appeared under the care of the Chevalier de Perrin in 6 vols. (Paris, 1734–37). It contained only the letters to Madame de Grignan, and these were subjected to editing rather careful than conscientious, the results of which were never thoroughly removed until quite recently. In the first place, Madame de Simiane, who possessed her mother's replies, is said to have burnt the whole of these from religious motives; this phrase is explained by Madame de Grignan's Cartesianism, which is supposed to have led her to expressions alarming to orthodoxy. In the second, scruples partly having to do with the susceptibilities of living persons, partly concerning Jansenist and other prejudices, made her insist on numerous omissions. Thirdly, and most unfortunately, the change of taste seems to have required still more numerous alterations of style and language, such as the substitution of "Ma Fille" for Madame de Sévigné's usual and charming "Ma Bonne," and many others. Perrin followed this edition up in 1751 with a volume of supplementary letters not addressed to Madame de Grignan, and in 1754 published his last edition of the whole, which was long the standard (8 vols., Paris). During the last half of the 18th century numerous editions of the whole or parts appeared with important additions, such as that of 1756, giving for the first time the letters to Pomponne on the Fouquet trial; that of 1773, giving letters to Moulceau; that of 1775, giving for the first time the Bussy letters separate from his memoirs, etc. An important collected edition of all these fragments, by the Abbé de Vauxcelles, appeared in 1801 (Paris, An IX.) in 10 vols.; five years later Gouvelle (Paris, 1806, 8 vols.) introduced the improvement of chronological order; this was reprinted in 12 vols. (Paris, 1819) with some more unpublished letters which had separately appeared meanwhile. In the same year appeared the first edition of M. de Monmerqué. From that date continual additions of unpublished letters were made, in great part by the same editor, and at last the whole was remodelled on manuscript copies (the originals unfortunately are available for but few) in the edition called Des Grands Écrivains, which M. de Monmerqué began, but which, owing to his death, had to be finished by MM. Regnier, Paul Mesnard, and Sommer (Paris, 1862–1868). This, which entirely supersedes all others (even a handsome edition published during its appearance by M. Silvestre de Sacy), consists of twelve volumes of text, notes, etc., two volumes of lexicon, and an album of plates. It contains all the published letters to and from Madame de Sévigné, with the replies where they exist, with all those letters to and from Madame de Simiane (many of which had been added to the main body) that contain any interest. The sole fault to be found with this excellent edition is the omission to add to each volume a table of contents giving each letter as it comes with a brief abstract of its contents. To it, however, must be added two volumes (printed uniformly) of *Lettres Inédites*, published by M. Ch. Capmas in 1876 and containing numerous variants and additions from a MS. copy discovered in an old curiosity shop at Dijon. Of less elaborate and costly editions that in the collection Didot (6 vols., Paris, v.d.) is by far the best, though, in common with all others except the *Grands Écrivains* edition, it contains an adulterated text.

Works on Madame de Sévigné are innumerable. The biography by Paul Mesnard is nearly exhaustive, but the most elaborate biographical book is that of Walckenaer (3d ed., Paris, 1856, 5 vols.), to which should be added the remarkable *Histoire de Mme. de Sévigné* of Aubenas (Paris and St. Petersburg, 1842). In English an excellent little book by Miss Thackeray (Mrs. Ritchie), Edinburgh and London, 1881, may be recommended. Most of the editions have portraits more or fewer. (G. SA.)

SEVILLE, a Spanish province—one of the eight into which Andalusia is divided—and formerly one of the four Moorish kingdoms, is bounded on the S. by Malaga and Cadiz, on the W. by Huelva, on the N. by Badajoz, and on the E. by Cordova. The superficial area is 5429 square miles, and in 1877 the population numbered 505,291. Northwards the province is broken up by low spurs of the Sierra Morena, the summits of which in the extreme north rise to a considerable height; but in the southern and larger half the ground is flat and fertile, and the only mountainous part is the frontier line formed by the Sierra de Ronda. The Guadalquivir traverses the province from northeast to southwest and receives in its course the waters of several streams, the chief being the Genil and the Guadaira on the left, and the Guadalimar to the right. The province is one of the most productive and flourishing in Spain, and grows all kinds of grain and vegetables. Oil and wine, oranges and olives, are among its chief exports, while tobacco, leather, paper, spirits, chocolate, textile fabrics of silk and wool, soap, glass, and earthenware are amongst its manufactures. Sheep and oxen, horses and asses, are reared on its pastures; and in the mountainous districts there are copper, silver, lead, iron, coal, and salt mines, and quarries of chalk and marble. Commerce has made great strides of late years owing to the opening up of the country by railways, and foreign capital has developed the natural resources of the district. The province is divided for administrative purposes into fourteen partidos judiciales and ninety-eight ayuntamientos, and is represented in the cortes by four senators and twelve deputies. The following towns have a population of more than 10,000 within the municipal boundaries: Seville (see below), Carmona (17,426), Constantina (10,988), Ecija (24,955), Lebrija (12,864), Marchena (13,768), Moron de la Frontera (14,879), Osuna (17,211), and Utrera (15,093).

SEVILLE (Span. *Sevilla*, Latin *Hispalis*, Arabic

Ishbîliya) capital of the above province and the seat of an archbishopric, with a population of 133,938 in 1877, is situated in 37° 22′ N. lat. and 5° 58′ W. long., 62 miles (95 by rail) north-northeast of Cadiz and 255 miles south-southwest of Madrid, on the left bank of the Guadalquivir, which here flows through a level country as productive as a garden. The river is navigable up to the city, which is highly picturesque in its combination of ancient buildings with busy commerce. From the earliest times the port has been a chief outlet for the wealth of Spain. Under the Romans the city was made the capital of Bætica, and became a favorite resort for wealthy Romans. The emperors Hadrian, Trajan, and Theodosius were born in the neighborhood at Italica (now Santiponce) where are the remains of a considerable amphitheatre. The chief existing monument of the Romans in Seville itself is the aqueduct,

Plan of Seville.

on four hundred and ten arches, by which the water from Alcalá de Guadaira continued until recently to be supplied to the town. At the beginning of the 5th century the Silingi Vandals made Seville the seat of their empire, until it passed in 531 under the Goths,

who chose Toledo for their capital. After the defeat of Don Roderick at Guadalete in 712 the Arabs took possession of the city after a siege of some months. Under the Arabs Seville continued to flourish. Edrisi speaks in particular of its great export trade in the oil of Aljarafe. The district was in great part occupied by Syrian Arabs from Emesa, part of the troops that entered Spain with Balj in 741 at the time of the revolt of the Berbers. It was a scion of one of these Emesan families, Abú 'l-Kásim Mohammed, cadi of Seville, who on the fall of the Spanish caliphate headed the revolt of his townsmen against their Berber masters (1023) and became the founder of the Abbádid dynasty, of which Seville was capital, and which lasted under his son Mo'tadid (1042–1069) and grandson Mo'tamid (1069–1091) till the city was taken by the Almoravids. The later years of the Almoravid rule were very oppressive to the Moslems of Spain; in 1133 the people of Seville were prepared to welcome the victorious arms of Alphonso VII., and eleven years later Andalusia broke out in general rebellion. Almohade troops now passed over into Spain and took Seville in 1147. Under the Almohades Seville was the seat of government and enjoyed great prosperity; the great mosque was commenced by Yúsuf I. and completed by his son the famous Almanzor. In the decline of the dynasty between 1228 and 1248 Seville underwent various revolutions, and ultimately acknowledged the Hafsite prince, who, however, was unable to save the city from Ferdinand III., who restored it to Christendom in 1248. The aspect of the town even now is essentially Moorish, with its narrow tortuous streets and fine inner court-yards to the houses. Many of these date from before the Christian conquest, and the walls and towers which until recently encircled the city for a length of 5 miles have a similar origin. The victory of Ferdinand brought temporary ruin on the city, for it is said that 400,000 of the inhabitants went into voluntary exile, and some time elapsed before Seville recovered from the loss. But its position was too favorable for trade for it to fall into permanent decay, and by the 15th century it was again in a position to derive full benefit from the discovery of America. After the reign of Philip II. its prosperity gradually waned with that of the rest of the Peninsula; yet even in 1700 its silk factories gave employment to thousands of workpeople; their numbers, however, by the end of the 18th century had fallen to four hundred. In 1800 an outbreak of yellow fever carried off 30,000 of the inhabitants, and in 1810 the city suffered severely from the French under Soult, who plundered to the extent of six millions sterling. Since that time it has gradually recovered prosperity, and is now one of the most busy and active centres of trade in the Peninsula. Politically Seville has always had the reputation of peculiar loyalty to the throne from the time when, on the death of Ferdinand III., it was the only city which remained faithful to his son Alphonso the Wise. It was consequently much favored by the monarchs, and frequently a seat of the court. In 1729 the treaty between England, France, and Spain was signed in the city; in 1808 the central junta was formed here and removed in 1810 to Cadiz; in 1823 the cortes brought the king with them from Madrid; and in 1848 Seville combined with Malaga and Granada against Espartero, who bombarded the city but fled on the return of Queen Maria Christina to Madrid.

Seville contains treasures of art and architecture which make it one of the most interesting cities in Europe. The cathedral, dedicated to Santa Maria de la Sede, ranks in size only after St. Peter's at Rome, being 415 feet long, 298 feet wide, and 150 feet high to the roof of the nave. The west front is approached by a high flight of steps, and the platform on which the cathedral stands is surrounded by a hundred shafts of columns from the mosque which formerly occupied the site. The work of building began in 1403 and was finished in 1519, so that the one style of Spanish Pointed Gothic is fairly preserved throughout the interior, however much the exterior is spoiled by later additions. Unfortunately the west front remained unfinished until 1827, when the central doorway was completed in a very inferior manner; but this has now been renewed in a purer style. At the east end are two fine Gothic doorways with good sculpture in the tympana; and on the north side the Puerta del Perdon, as it is called, has some very exquisite detail over the horseshoe arch, and a pair of fine bronze doors. The exterior of the cathedral may be disappointing, but the interior leaves little to be desired. It forms a parallelogram containing a nave and four aisles with surrounding chapels, a central dome 171 feet high inside, and at the east end a royal sepulchral chapel, which was an addition of the 16th century. The thirty-two immense clustered columns, the ninety-three windows, mostly filled with the finest glass by Flemish artists of the 16th century, and the profusion of art work of various kinds displayed on all sides produce an unsurpassed effect of magnificence and grandeur. The reredos is an enormous Gothic work containing forty-four panels of gilt and colored wood carvings by Dancart, dating from 1482, and a silver statue of the Virgin by Francisco Alfaro of 1596. The archbishop's throne and the choir-stalls (1475–1548) are fine pieces of carving, and amongst the notable metal-work are the railings (1519) by Sancho Nuñoz, and the lectern by Bartolomé Morel of the same period. The bronze candelabrum for tenebræ, 25 feet in height, is a splendid work by Morel. In the Sacristia Alta is a silver repoussé reliquary presented by Alphonso the Wise in the 13th century; and in the Sacristia Mayor, which is a good plateresque addition by Diego de Riaño in 1530, is a magnificent collection of church plate and vestments. At the west end of the nave is the grave of Ferdinand, the son of Columbus, and at the east end, in the royal chapel, lies the body of St. Ferdinand, which is exposed three times in the year. This chapel also contains a curious life-size image of the Virgin, which was presented to the royal saint by St. Louis of France in the 13th century. It is in carved wood with movable arms, seated on a silver throne and with hair of spun gold. The chief pictures in the cathedral are the Guardian Angel and the St. Anthony of Murillo, the Holy Family of Tobar, the Nativity and La Generacion of Luis de Vargas, Valdés Leal's Marriage of the Virgin, and Guadalupe's Descent from the Cross. In the Sacristia Alta are three fine paintings by Alexo Fernandez, and in the Sala Capitular are a Conception by Murillo and a St. Ferdinand by Pacheco. The organ is one of the largest in the world; it contains over 5300 pipes. A curious and unique ritual is observed by the choir boys on the festivals of Corpus Christi and the Immaculate Conception,—a solemn dance with castanets being performed by them before the altar; the custom is an old one but its origin is obscure. The Sagrario on the north of the cathedral is a Renaissance addition by Miguel de Zumarraga, which serves as the parish church. At the northeast corner of the cathedral stands the Giralda, a bell tower of Moorish origin, 275 feet in height. The lower part of the tower, or about 185 feet was built in the latter half of the 12th century by Abu Yusuf Yakub; the upper part and the belfry, which is surmounted by a vane formed of a bronze figure 14 feet high representing The Faith, were added by Fernando Ruiz in 1568. The ascent is made by a series of inclined planes. The exterior is encrusted with delicate Moorish detail, and the tower is altogether the finest specimen of its kind in Europe. At the base lies the Court of Oranges, of which only two sides now remain; the original Moorish fountain, however, is still preserved. But the chief relic of the Arab dominion in Seville is the Alcazar, a palace excelled in interest and beauty only by the Alhambra of Granada. It was begun in 1181 by Jalubi during the best period of the Almohades, and was surrounded by walls and towers of which the Torre del Oro, a decagonal tower on the river side, is now the principal survival. Pedro the Cruel made considerable alterations and additions in the 14th century, and worse havoc was afterwards wrought by Charles V. Restorations have been effected as far as possible, and the palace is now an extremely beautiful example of Moorish work. The façade, the hall of ambassadors, and the Patio de las Muñecas are the most striking portions, after which may be ranked the Patio de las Doncellas and the chapel of Isabella. Among other Moorish remains in Seville may be mentioned the Casa O'Shea, which is somewhat spoiled by whitewash and the Casa de las Dueñas, with eleven court-yards and nine fountains. The Casa de Pilatos is in a pseudo-Moorish style of the 15th century, and, in addition to its elegant court-yard surrounded by a marble colonnade, contains some fine decorative work. The Casa de los Abades is in the Sevillian plateresque style, which is strongly tinged with Moorish feeling. The following are the most notable churches in Seville: Santa Maria la Blanca, an old

Jewish synagogue; San Marcos, badly restored, but with a remarkable mudejar portal; Omnium Sanctorum, erected upon the ruins of a Roman temple; San Juan de la Palma; San Julian; Santa Catalina; San Miguel; San Clemente el Real; the church of La Sangre Hospital; the Gothic Parroquia of Santa Ana, in the Triana suburb; and La Caridad. The last-named belongs to a well-conducted almshouse founded by the Sevillian Don Juan, Miguel de Manara. It possesses six masterpieces by Murillo, and two by Valdés Leal. The other churches, though generally deficient in architectural interest, are enriched by the products of the brush or chisel of Pacheco, Montañes, Alonso Cano, Valdés Leal, Roelas, Campaña, Morales, Vargas, and Zurbaran. The museum was formerly the church and convent of La Merced. It now contains priceless examples of the Seville school of painting, which flourished during the 16th and 17th centuries. Among the masters represented are Velazquez and Murillo (both natives of Seville), Zurbaran, Roelas, Herrera the Elder, Pacheco, Juan de Castillo, Alonso Cano, Cespedes, Bocanegra, Valdés Leal, Goya, and Martin de Vos. The university was founded in 1502, and its present buildings were originally a convent built in 1567 from designs by Herrera, but devoted to its present use in 1767 on the expulsion of the Jesuits. The Casa del Ayuntamiento, in the cinquecento style, was begun in 1545, and has a fine staircase and hall and handsome carved doors. The Lonja, or exchange, was built by Herrera in 1585 in his severe Doric and Ionic style; the brown and red marble staircase which leads to the Archivo de Indias is the best part of the design. The archives contain 30,000 volumes relating to the voyages of Spanish discoverers, many of which are still unexamined. The archbishop's palace dates from 1697; the most notable features are the Churrigueresque doorway and staircase. The royal cigar factory is an immense building 662 feet long by 524 feet wide, and contains twenty-eight court-yards. Employment is given in it to 4500 hands, who work up 2,000,000 pounds of tobacco yearly. The palace of San Telmo, now occupied by the duke of Montpensier, was formerly the seat of a naval college originally founded by the son of Columbus. The immense doorway is the principal architectural feature. The picture gallery is interesting and important. The chief squares in Seville are the Plaza Nueva, the Plaza de la Constitucion, the Plaza del Duque, and the Plaza del Triunfo. The bull-ring accommodates 18,000 spectators, and is the next in size to that at Madrid. There are several beautiful promenades, the principal being Las Delicias, along the river bank below the town. The city also contains several theatres. Across the river, and connected with the city by a bridge, is the Gypsy quarter of the Triana. The navigation of the river has been improved of late years so that vessels of large draught can now ascend the stream. The results are shown in a larger trade, and in 1883 the aggregate burden of vessels cleared amounted to 358,541 tons (65,324 British). The imports were valued at £1,879,522, and the exports at £1,190,625. In the latter were included 3110 tuns of olive oil shipped to the United Kingdom, and 1610 tons of quicksilver from the Almaden mines, which had formerly sent their produce *via* Lisbon. In addition to strictly local industries the chief factories of the city are the tobacco factory, the cannon foundry, and the small-arms factory. There are also a petroleum refinery, some soap works, iron foundries, artificial ice and marmalade factories, and several potteries. The ancient sources of water supply having proved insufficient, a new system of water works was designed, and was brought to a successful completion in 1883 by a firm of English engineers. (H. B. B.)

SÈVRES, a town of France, in the department of Seine-et-Oise, on the left bank of the Seine, midway between Paris and Versailles, with a population of 6768 in 1881, owes its celebrity to the Government porcelain manufactory, which dates from 1756. In 1876 a new building was erected at the end of the park of St. Cloud to replace the older structures, which were in a dangerous state, but have since been transformed into a normal school for girls. In the museum connected with the works are preserved specimens of the different kinds of ware manufactured in all ages and countries, and the whole series of models employed at Sèvres from the commencement of the manufacture, for an account of which see vol. xix. pp. 657–58. A technical school of mosaic was established at Sèvres in 1875.

SÈVRES, Deux, a department of western France, formed in 1790 mainly of the districts of Thouars, Gâtinais, and Niortais, which constituted about one-fourth of Poitou, and to a small extent of a portion of Basse-Saintonge and Angoumois, and a very small fragment of Aunis. It derives its name from the Sèvre of Niort, which flows across the south of the department from east to west, and the Sèvre of Nantes, which drains the northwest. Lying between 45° 58′ and 47° 7′ N. lat. and between 0° 56′ W. and 0° 13′ E. long., it is bounded (for the most part conventionally) N. by Maine-et-Loire, E. by Vienne, S.E. by Charente, S. by Lower Charente, and W. by La Vendée. Part belongs to the basin of the Loire, part to that of the Sèvre of Niort, and part to that of the Charente. There are three regions,—the Gâtine, the "Plain," and the "Marsh,"—distinguished by their geological character and their general physical appearance. The Gâtine formed of primitive rocks (granite and schists), is the continuation of the "Bocage" of La Vendée and Maine-et-Loire. It is a poor district with an irregular surface, covered with hedges and clumps of woods or forests. The Plain, resting on Oolitic limestone or the "white rock" (*pierre blanche*), is a fertile grain country. The Marsh, occupying only a small part of the department to the southwest, consists of alluvial clays which also are extremely productive when properly drained. The highest point in the department (892 feet above the sea) is to the east of Parthenay; the lowest lies only 10 feet above sea-level. The climate is mild, the annual temperature at Niort being 54° Fahr., and the rainfall a little more than 24 inches. The winters are colder in the Gâtine, the summers warmer in the Plain; and the Marsh is the moistest and mildest of the three districts.

With a total area of 1,482,655 acres, the department contains 1,043,752 acres of arable ground, 125,534 acres of meadows, 49,129 of vineyards, 106,222 of forests, 20,429 of heath. The live stock in 1880 comprised 36,150 horses, 12,800 mules, 2012 asses, 217,935 cattle, 18,405 sheep (wool clip 102 tons) 78,930 pigs, 50,321 goats, 18,845 beehives (55 tons of honey). The horses are a strong breed, and the department raises mules for Spain, the Alps, Auvergne, and Provence. In 1883 there were produced—wheat, 3,909,260 bushels; meslin, 466,909; rye, 673,920; and in 1880 barley produced 1,293,600 bushels; buckwheat, 132,650; maize and millet, 508,062; oats, 2,744,500; potatoes, 4,312,000; pulse, 192,500 bushels; beetroot, 123,429 tons; hemp, 945 tons; flax, 245 tons; colza seed, 75,900 bushels (640 tuns of oil). The wine and cider amounted in 1882 to 2,859,912 and 210,914 gallons respectively. Vegetables (artichokes, asparagus, cabbage, pease, onions) are largely cultivated. Oaks, chestnuts, and beeches are the most important trees. The apple-trees of the Gâtine and the walnut-trees of the Plain are also of considerable value. Coal (200 miners, and 21,487 tons in 1882) and peat are worked; iron-ore, argentiferous lead, and antimony exist but are not worked; and free-stone, both hard and soft, is very extensively quarried. There are several sulphurous mineral waters in the department. The most important industry is the manufacture of cloth—serges, druggets, linen, handkerchiefs, flannels, swan-skins, and knitted goods. Wool and cotton-spinning, tanning and currying, glove, brush, and hat making, distilling, brewing, flour-milling, and oil-refining are also carried on. In 740 establishments water-power is used to the extent of 3000 horse-power; and 301 stationary and 165 movable steam-engines represent respectively 1895 and 677 horse-power. The commerce of the department, which supplies mules, cattle, and provisions for Paris and the neighboring great towns, is facilitated by 21 miles of waterway (the Sèvre and its left-hand tributary the Mignon), 289 miles of national roads, 3535 of other roads, and 232 miles of railway. In density of population (350,103 in 1881) the department is below the average of France. It contains 38,000 Protestants, especially in the southeast, there being only three French departments—Gard, Ardèche, and Drôme—which surpass it in this respect. The four arrondisements are Niort, Bressuire (3549 inhabitants in the town), Melle (2433), and Parthenay (4842); the cantons number 31, and the communes 356. It is part of the diocese of Poitiers, where also is the court of appeal; its military headquarters are at Tours. St. Maixent (4790) has an infantry school.

SEWAGE. See Sewerage.

SEWARD,[1] William Henry (1801–1872), Ameri-

[1] [Mr. Seward was one of the most philosophical minds which the anti-slavery struggle in the United States carried into responsible administrative place. His career was in stormy times, and

can statesman, was born May 16, 1801, in the town of Florida, Orange county, N. Y. He was graduated at Union College in 1820, and began the practice of law three years after in the town of Auburn, which became

yet marked by a suavity of manner rarely broken. It was also clouded by a peculiar repetition of misfortunes, for in the three instances where the party with which he acted obtained supreme control of the government, the presidents, who were Harrison, Taylor, and Lincoln, died in office, and their policies were repudiated by their successors or miscarried in their hands. In the era of personal politics, which began upon the disappearance of the old Federalist organization under Mr. Monroe, Mr. Seward became the advocate of John Quincy Adams's aspirations for a second term at the White House, presiding in 1828 over a New York State convention of young men devoted to the accomplishment of that object. Thus he attached himself to the Whigs from their origin and remained in their ranks until the modern Republican party was organized.

A temporary and local episode however threw him at the outset of his career into public prominence in company with Millard Fillmore, Thurlow Weed, and John C. Spencer, men who, in other alliances, long maintained a foremost place in political history. In 1826 William Morgan, a tailor of Batavia in New York, was suspected of an attempt to divulge in print the secrets of Freemasonry. Suddenly he disappeared, and, though traced to Fort Niagara, his person was never produced in court, notwithstanding the interest of the Masons at a time of bitter exasperation to purge themselves of a crime of which as a body, they were probably innocent. The general belief was that Morgan had been drowned in Lake Ontario. The tribunals of the State failed to secure any conviction settling his fate, and the opinion spread that Masonic oaths were incompatible with the duties of jurors and magistrates. In 1828 the Anti-Masonic party polled nearly one-tenth of the votes of New York, and two years later its quadrupled strength carried Mr. Seward into the State Senate, at which time Thurlow Weed, whose life-long friendship with him had already begun, removed to Albany and established the *Evening Journal* to oppose both Jackson and Calhoun. The next year Mr. Seward presided in Philadelphia at the National Convention of the Anti-Masons which nominated William Wirt for the presidency, and drafted its platform. This was the first of the political national conventions which have since become the accepted method of selecting party candidates for the chief executive offices of the nation.

As the Anti-Masonic movement expanded beyond the limits of Western New York, it became more and more an agency of opposition to Democratic measures, and it was submerged after two or three years in the new Whig party, at the head of which Mr. Seward was beaten by William L. Marcy in 1834 as candidate for the governorship of his native State. Four years later with the same candidates in the field the choice of the electors was reversed and Mr. Seward became the first Whig governor of New York. During his administration he saw his and Mr. Weed's endeavors successful in securing the nomination and triumph of General Harrison as the first Whig president of the country. Mr. Tyler's recalcitrancy to his party and his revival of the Texas annexation question remanded the Whigs to a minority for eight years, but Mr Seward's gubernatorial terms were distinguished by the policy of internal improvements, among which was the enlargement of the Erie canal, of extending the system of State education, of completing the geological survey of the State, and of reformation in the law-courts. They also witnessed the abolition of imprisonment for debt, the obliteration from the statute book of the last traces of slavery in New York, and Mr. Seward's refusal to surrender on the requisition of the governor of Virginia two seamen charged with abducting slaves, the former claiming that one State could not force a requisition on another for acts which were not offences at law in the State upon which the claim was made, and which were generally esteemed as humane. On the other hand he endeavored to obtain from the British government the release of some Americans who had been captured in arms during the Canadian "Patriots'" war and transported to Van Dieman's Land.

The same Whig reaction which sent General Taylor to the White House at Washington secured the election of his friend, Mr. Seward, to the Senate of the United States, where he became at once the recognized advocate of the president's opposition to the demand of new guarantees for slavery growing out of the acquisition of territory by the Mexican war. The Senator declared the national domain to be sacred to liberty under the constitution as well as under "a higher law than the constitution,"—a phrase which was long assailed as an admission that the anti-slavery party would evade its political obligations at the convenience of its conscientious scruples. The admission of California and Kansas as free States he supported with firmness and ability, while with equal resolution he contested the repeal of the Missouri compromise and the passage of the Fugitive Slave Law. Mr. Fillmore's accession to the presidency and his adoption of the policy urged by the Southern wing of his party divided the Whigs, and snatched from Mr. Seward his influence with the administration, compelling him to build again the political structure on which his influence was to rest. In the national convention of 1852 which nominated General Scott for the presidency Mr. Seward appeared as the leader of the Northern, Messrs. Webster and Fillmore as leaders of the Southern wing, and the former conceded to its opponents the production of a platform if it might select the candidate. After some contest this arrangement was secured, but with fatal results to the Whigs, for the election showed that they could command the confidence neither of the South nor of the anti-slavery party of the North. Mr. Seward's reëlection to the Senate in 1855 was a remarkable triumph of personal influence, since the incipient Republicanism as yet was scarcely organized, his old party was dissolved and he was bitterly obnoxious to the pro-slavery men and to the Native Americans just achieving startling local successes. His triumph however was an indication that the time had come for a new organization of the anti-slavery sentiment, and he actively forwarded the formation of the Republican party, which in the next year swept eleven northern States to the side of its candidate, John C. Fremont. From this time Mr. Seward's leadership of a great united national movement was unquestioned, and with it came the inevitable consequence of being the target for all opposing shafts.

At the convention in Chicago (1860) Mr. Seward's nomination was defeated by the alleged agency of Horace Greeley, who had uttered resentment against him because some crumbs of political patronage had not fallen from his hands upon the editor's table, but it was in accordance with many precedents that Mr. Lincoln should give to his most formidable competitor in the nominating convention the chief place in his cabinet, thus respecting the predilections of the minority of his party.

Peculiar difficulties beset the new Secretary. All the foreign legations and consulates were in the control of officers appointed by Mr. Buchanan's pro-slavery administration and were for the most part well-affected towards the Southern Confederacy which had already established a government at Montgomery in Alabama. Accredited emissaries of that government were in the chief capitals of Europe appealing to their commercial cupidity. Great Britain was in the control of her Whig party, then at the flood-water mark of its domination by free-trade and in the first rhapsody of Cobden's commercial treaty with France. Whatever "reliance on the cordial friendship of the plain people of Great Britain" Mr. Seward may have had, it was out of his province to appeal to them, and he had abundant reason until the civil war ended to dread the unfriendly intervention of both the governments of Lord Palmerston and Napoleon III. Nor do his diplomatic despatches show that Mr. Lincoln's proclamations of emancipation conciliated the good will of either of them, but that both persisted that the federal armies were, in the words of Earl Russell, "fighting for empire." The facts which confronted Mr. Seward's accession to the cabinet were that he had to entirely reorganize the diplomatic and consular services of the United States, that before Mr. Lincoln had been two months in office France and Great Britain had entered into an agreement to take the same course in regard to the civil war in America, and that a few days later Earl Russell announced to parliament the determination of his government to confer the rights of a belligerent upon the Southern Confederacy,—a step which was taken by Queen's proclamation on the 15th of May, the day before Mr. Adams was officially received as the minister of the new administration at the English court. Before the first year was over English, French and Spanish forces were on Mexican soil allied by "motives and sentiments," to use Mr. Seward's own phrase, which "resolve themselves into a jealousy of the advancement of the United States." With the great maritime nations of Europe leagued to subvert the authority of the American Union and eager to find or create pretexts for an intervention disastrous to it, the highest qualities were necessary to avert the danger and maintain the national honor. Mr. Seward ceased not to insist that the Confederates were insurgents and that foreign recognition of them in any form until they had shown their ability to achieve independence was an injurious violation of international comity, and he promptly declined repeated suggestions from the European league for arbitration or mediation between the contending sections, insisting that the halls of Congress were the constitutional and sufficient resort in which the representatives of the North and the South should settle their differences.

In the Trent affair of 8th November, 1861, when four Confederate emissaries were taken from the deck of an English steamer by Captain Wilkes and brought to Fort Warren in Boston harbor, Mr. Seward at once disclaimed that the act was authorized by the government, pronounced that in the existing state of international law Captain Wilkes had erred in not bringing the Trent as a prize before an admiralty court, but concluded that he would deliver the prisoners upon the demand of the British government in order to assimilate its interpretation of neutral maritime rights to the more liberal one maintained by the United States ever since they began to resist the right of search which led to the war of 1812-15. He had several months previously proposed to the English government that the United States would adhere to the Declaration of Paris and abandon the right of privateering, with an additional provision exempting all goods of "non-combatants from confiscation in maritime war," but broke off the negotiation upon Earl Russell's refusal to enter into such engagement if it were to "have any bearing, direct or indirect, on the internal differences now prevailing in the United States," or, in other words, if it were to curtail any of the belligerent rights which he had conceded or might accord to the Confederacy.

In the history of the Alabama claims Mr. Seward laid the foundations of the final action upon them. The British government took the position that its own municipal law was the measure of its international duties. Mr. Seward replied that every sovereign state ought to make its domestic statutes conform to its obligations of neutrality. The Foreign Enlistment Act of Great Britain was shown to Earl Russell to provide sufficient remedies against the fitting out of armed cruisers in her ports to prey upon the commerce of belligerents. He then assumed that it was not the duty of the executive to enforce municipal law, but that cases arising under it should be taken before the regular tribunals and there determined, thus compelling the agents of the United States to act as the detectives of Great Britain in the enforcement of her own statutes. Mr. Seward claimed that this position was not consistent with the "due diligence" which nations were bound to exercise for the maintenance of their own neutrality, and that the mode of obtaining international rights was not forensic but diplomatic. These positions of the United States were virtually affirmed by the Geneva Court of Arbitration in 1872, although it excluded all claims for indirect or consequential damages, and on account of vessels whose hostile careers had no origin, but which had only enjoyed refuge, in British ports. Mr. Seward ceased not to record as it arose and to urge each pretension of his government to indemnity for the acts of cruisers escaping the dull vigilance of the Palmerston ministry, although Earl Russell had early requested that no more such claims might be presented to him, and after the war was over had declined either to make reparation for their captures or "to refer the question to any foreign state." That ministry was overthrown in

his home for the rest of his life. Several of his cases brought him reputation as a lawyer, but he soon drifted into the more congenial field of politics. After he had served for four years in the State Senate, the Whig party of New York nominated him for governor of the State in 1834. Though then defeated, he was nominated again in 1838 and elected, serving until 1842. He then returned to his law practice, retaining, however, the recognized leadership of the Whig party in the most important State of the Union. During the next seven years slavery became the burning question of American politics. The purely ethical and the philanthropic sides of the anti-slavery struggle are represented by GARRISON and GREELEY (*q.v.*). Seward was the first to develop that purely political side, with an economic basis, which probably best met the desires and prejudices of the great mass of those who took part, willing or unwilling, in the struggle. The keynote of his theory was struck in 1848 in a speech at Cleveland: "The party of slavery upholds an aristocracy, *founded on the humiliation of labor*, as necessary to the existence of a chivalrous republic." The absurdity of the conception of a civilized nation which, in flat opposition to historical development, should tolerate forever a systematic humiliation of labor was only his starting point. His theory culminated naturally in his famous Rochester speech of 1858, in which he enumerated the inevitable direct and indirect consequences of a free-labor and a slave-labor system respectively, showed the two to be absolutely irreconcilable and yet steadily increasing their interferences with one another, and drew this pregnant inference: there is here "an irrepressible conflict between opposing and enduring forces, and it means that the United States must and will, sooner or later, become either entirely a slave-holding nation or entirely a free-labor nation." But the germ of the "irrepressible conflict" of 1858 lay clearly in the utterances of 1848, and Seward was even then most widely known as its exponent. When, therefore, the New York Whigs, who in 1849 controlled the State legislature, which elects United States senators, sent Seward to the Senate with hardly a show of opposition, their defiance of the southern wing of their party was a premonition of the general break-up of parties three years afterwards. In the Senate Seward had at first but two pronounced anti-slavery associates. As anti-slavery feeling increased, and the Republican party was organized in 1855–56, he went into it naturally, for it was to him only an anti-slavery Whig party, and his preëminent ability made him at once its recognized leader. In the Republican convention of 1860 he was the leading candidate for the nomination for president; and it was only by a sudden union of all the elements of opposition to him that the nomination was finally given to Abraham Lincoln, whose name was then hardly known outside of Illinois. It has been an almost invariable rule that American presidents have found their most irritating difficulties in dealing with the New York leaders of their respective parties; Lincoln when elected removed any such possibility by offering Seward the chief position in his cabinet, that of Secretary of State. Here, for at least four years, Seward did the great work of his life. His errors, whether of constitutional law, international law, or policy, are more clearly seen now than they were then. In spite of them all the estimate of the value of his work must be very high, if we consider the chances in favor of foreign intervention at some time during a four years' war, and his unbroken success in inculcating on other Governments the propriety and wisdom of neutrality. Much of this success was due to circumstances which he did not create, to his ability to rely solidly on the cordial friendship of the "plain people" (to use Lincoln's common phrase) of Great Britain and France, and particularly to the change of policy induced by the emancipation proclamations of 1862–63; but much is still left to the credit of the secretary, whose zeal, acuteness, and efficiency brought the ship safely through the intricacies of international relations while the crew were putting out the fire in her hold. In the process of reconstruction which immediately followed the war Seward sided heartily with President Johnson and shared his defeat. The Whig element had been burned out of the Republican party by the war; a new party had grown up, not limited by *ante bellum* notions, and it rapidly came to look upon Seward, its once trusted leader, not only as a traitor but as the main intellectual force which supported Johnson's clumsy attempts at treason. At the end of his second term as secretary of state in 1869 he retired to his home at Auburn, broken by loss of health, by loss of political standing, and by the death of his wife and daughter. He spent the next two years in foreign travel, and died at Auburn, October 10, 1872.

Of Seward's *Life and Works*, in 5 vols., edited by George E. Baker, the last volume deals with his career during his first term as Secretary of State.

SEWERAGE is the process of systematically collecting and removing refuse from dwellings. The matter to be dealt with may conveniently be classified as made up of four parts: (1) dust, ashes, kitchen waste, and solid matters generally, other than solid excreta; (2) excreta, consisting of urine and fæces; (3) slop-water, or the discharge from sinks, basins, baths, etc., and the waste water of industrial processes; (4) surface water due to rainfall. Before the use of underground conduits became general, the third and fourth constituents were commonly allowed to sink into the neighboring ground, or to find their way by surface channels to a watercourse or to the sea. The first and second constituents were conserved in middens or pits, either together or separately, and were carried away from time to time to be applied as

1866 and was succeeded by the fairer-minded Tory government of the Earl of Derby, with which Mr. Seward renewed the discussion and carried it to the point of a convention in 1869 between the two nations to submit all the claims of individuals on each side against either contracting power arising since 8th February, 1853 to arbitration. This treaty failed to obtain the approval of the Senate chiefly because the claims of the United States government were not recognized in it, but it was the initiation of those negotiations which two years later issued in the treaty of Washington. Though others reaped the fame of the settlement, yet Mr. Seward more than they was the means of placing the maritime law of nations upon a basis of clearer and higher principle, and of leading the way to a peaceful adjudication of gravest international differences.

Of the numerous treaties negotiated by this Secretary of State the more characteristic or important are that with Great Britain in 1862 for the suppression of the slave-trade, that of 1867 with Russia for the cession of Alaska on the payment of $7,200,000, those with North Germany, Bavaria, and Wurtemberg in 1868 overthrowing the European doctrine of the indefeasible allegiance of natives and conferring upon them the rights of expatriation and naturalization, a convention of 1866 with France for the evacuation of Mexico as the sequel to repeated intimations that the United States would sustain the Monroe doctrine even at the expense of war, and a treaty which was not ratified with the United States of Colombia in 1869 for a canal across the isthmus of Panama to be under the control of his own government. He endeavored to extend the national jurisdiction over the Danish West Indies and the Bay of Samana in Santo Domingo, to secure the acceptance of his views of naturalization by Great Britain, to effect the execution of slave-traders, arresting and returning to Cuba as a matter of natural comity one Arguelles who had landed and sold a cargo of negroes on that island, to restore the government of Juarez in Mexico and to prevent the execution there of the Archduke Maximilian. He was fertile of projects and persuasive in their advocacy. His support of President Johnson was disastrous to his popularity, though the attitude of conciliation towards the South in which it involved him corresponded with views he had long entertained and with his unquenchable hopefulness in the moral triumph of the constitutional theories to which he was wedded.

The conspirators in the assassination of Mr. Lincoln included his chief of cabinet in their murderous plans, and one of them named Atzerodt penetrated to the chamber where Mr. Seward was lying ill from injuries received in a fall from his carriage, and severely wounded him with a knife, felling his son and assistant by blows upon the head in effecting his flight. For six months Mr. Seward was incapacitated for official duty. Much of the time remaining to him in the retirement of private life was passed in visiting Alaska and Mexico, and in a journey round the world, during which he was received with marked distinction by sovereigns, their ministers and their subjects. An account of his *Travels Around the World*, which occupied his last days, appeared posthumously edited by his adopted daughter. A bronze effigy of him by Randolph Rogers stands at the junction of Broadway and Fifth Avenue in the city of New York. D. C. E.]

manure to the land. In more modern times the pits in which excrement was collected took the form of covered tanks called cesspools, and with this modification the primitive system of conservancy, with occasional removal by carts, is still to be found in many towns. Even where the plan of removing excrement by sewers has been adopted, the first kind of refuse named above is still treated by collecting it in pails or bins, whose contents are removed by carts either daily or at longer intervals. It therefore forms no part of the nearly liquid sewage which the other constituents unite to form.

Character of excremental sewage.

The second constituent is from an agricultural point of view the most valuable, and from a hygienic point of view the most dangerous, element of sewage. Even healthy excreta decompose, if kept for a short time after they are produced, and give rise to noxious gases; but a more serious danger proceeds from the fact that in certain cases of sickness these products are charged with specific germs of disease. Speedy removal or destruction of excremental sewage is therefore imperative. It may be removed in an unmixed state, either in pails or tanks or (with the aid of pneumatic pressure) by pipes; or it may be defæcated by mixture with dry earth or ashes; or, finally, it may be conveyed away in sewers by gravitation, after the addition of a relatively large volume of water. This last mode of disposal is termed the water-carriage system of sewerage. It is the plan now usually adopted in towns which have a sufficient water supply, and it is probably the mode which best meets the needs of any large community. The sewers which carry the diluted excreta serve also to take slop-water, and may or may not be used to remove the surface water due to rainfall. The water-carriage system has the disadvantage that much of the agricultural value of sewage is lost by its dilution, while the volume of foul matter to be disposed of is greatly increased. But it has been found that, even when the excrement of a community is kept out of the sewers, and subjected to distinct treatment, the contents of the sewers are still so foul that their discharge into streams is scarcely less objectionable than when the water-carriage system is adopted; and, further, it appears difficult if not impossible to realize the agricultural value of excrement by any process of separate treatment that is not offensive or dangerous or inapplicable to towns.

Water-carriage system.

When, in the water-carriage system, the same sewers carry foul sewage and surface-water due to rainfall, the sewerage is said to be "combined"; the "separate" system, on the other hand, is that in which a distinct set of sewers is provided to carry off rainfall. Each plan has its advantages. In the separate system the foul-water sewers need be large enough to take only the normal flow; they may thus be made self-cleansing much more readily than if their size were sufficient to carry the immensely greater volume to which (on the combined plan) sewage may be swollen during heavy rain. The amount of dangerously foul matter is also much reduced. On the other hand, the contents of the rain-water sewers are still too much tainted by the filth of the streets to render their discharge into rivers or lakes desirable; and the complication of two sets of mains and branches is a serious drawback. Where old sewers are giving place to new ones it is not unusual to retain the old sewers for the carriage of surface-water; but in new works a single system of sewers, provided with storm-overflows to relieve them of part of the rainfall during exceptionally heavy showers, would probably be preferred in nearly every case.[1] Since sewers should, in all cases, be water-tight, they do not form suitable collectors of subsoil water.

Combined and separate systems of water-carriage.

The water-carriage system of sewerage will be noticed here under its three aspects: (1) the ultimate disposal of sewage; (2) the system of common sewers by which sewage is conveyed to its destination; (3) the domestic arrangements for the collection of sewage.

Heads of treatment.

1. The Ultimate Disposal of Water-carried Sewage.—In the water-carriage system of sewerage the fertilizing elements are so largely diluted that it becomes a matter of the utmost difficulty to turn them to profitable account. It has been estimated that every ton of London sewage contains ingredients whose value as manure is rather more than 2d.,[2] a value which, could it be realized, would make the sewage of the metropolis worth a million and three quarters sterling per annum. Sewage farming, however, does not pay. After much costly experiment the conviction is gaining ground that, neither by applying sewage directly to land, nor by any process of chemical treatment that has yet been proposed, can sewage be made to yield a return as manure which will cover the cost of its transport, treatment, and distribution, except perhaps in a few cases where the circumstances are peculiarly favorable. At the same time, sewage farming does afford one satisfactory solution of the problem of how to dispose of sewage without creating a nuisance—a problem in which any question of profit or loss is of secondary importance. A very early instance of irrigation by sewage is that of the Craigentinny Meadows, a sandy tract of 400 acres, on which part of the sewage of Edinburgh has been discharged during certain seasons for nearly a century. There, owing to favorable conditions, and to the fact that complete purification of the sewage is not attempted, the process yields a profit; but no such result could be looked for if the sea were not at hand to receive the imperfectly cleansed sewage and the wholly uncleansed surplus. Germany furnishes a still older example of irrigation in the sewage farm of the town of Bunzlau, which has been in existence for more than three hundred years.

Disposal of water-carried sewage.

Sewage farms.

Five methods of treating sewage may be named, of which two or more are often found in combination.

Discharge into the Sea or into a large watercourse is in general the least costly means by which a community can rid itself of its sewage. Much care in the choice of outlets is necessary to make this plan effective in avoiding nuisance. Some towns make use of tanks or outlet-sewers of large capacity, from which the discharge is allowed to occur only when the tide is ebbing. When the volume of sewage is very large, even this precaution does not wholly protect the neighboring coast from foul deposits. A striking instance is furnished by the case of London, which discharges its sewage into the tidal estuary of the Thames at Barking and Crossness during only some three or four hours from the time of each high tide. It is found that the discharged matter is washed up and down the river with every tide, occasionally reaching as far up as Teddington, and that the portion which is not deposited in the form of mud banks only very slowly works its way to the sea.

Discharge into the sea.

Broad Irrigation.—By this is meant the use of sewage to irrigate a comparatively large tract of cultivated land, in the proportion of about 1 acre (or more) of land to every 120 persons in the sewage-contributing population. This system is now largely and successfully used, especially where the soil is a porous sandy loam. Fears that the farms would prove dangerous to the health of the neighboring district, and that the crops and vegetables grown on them would be unwholesome, have proved groundless. When the farm is properly laid out and carefully managed the effluent water is pure enough to be admitted to a clear stream from which water-supply is drawn. Broad irrigation is practiced at

Broad irrigation.

[1] An exception to this remark may be made in the case of London, where the enormous area to be drained, as well as the difficulty of disposing of the foul sewage on account of its large volume, has led the Commissioners on Metropolitan Sewage Discharge to advise (in their Report of 1884) that "in new drainage works the sewage should be, as far as possible, separated from the rainfall."

[2] Hoffmann and Witt, *Report to the Government Referees on Metropolitan Drainage*, 1857.

Croydon, Cheltenham, Blackburn, and many other English towns; and it has recently been applied, on a very large scale, to dispose of the sewage of Berlin.

Intermittent Downward Filtration.—This is another mode of purifying sewage by applying it to land, which differs from broad irrigation in requiring a much smaller area in proportion to the sewage dealt with. In 1870 Dr. Frankland[1] drew attention to the fact that if sewage were passed through porous soil, not continuously but at intervals long enough to let the soil become aerated, rapid purification took place through the oxidizing action of the air which the soil held in its pores. He estimated that an acre of suitable ground, well furnished with subsoil drains to remove the water after percolation, could in this way take the sewage of 2000 persons. This estimate is now considered excessive, and 1000 persons to the acre is a more recent limit. Mr. J. Bailey-Denton at once took up Dr. Frankland's suggestion, and in his hands the system of intermittent filtration through land has been successfully applied to the sewage of many towns.[2] The land which constitutes the filter is used to grow vegetables and other crops. Clay soils are, as far as possible, avoided, and the land is thoroughly underdrained at a depth of about 6 feet. The sewage is distributed over the surface in open channels, the proper laying out of which is an important item in the cost of the system, but is essential to its success. When the number of persons exceeds 500 per acre it is advisable to precipitate the solid matter that is held in suspension before the liquid is applied to the land, in order to prevent the surface of the ground from becoming clogged with sewage sludge. Mr. Bailey-Denton has pointed out the advantage which the system of intermittent filtration offers as a supplement to broad irrigation, where that is carried out. A serious objection to the disposal of sewage by irrigation is the fact that the farmer must take the sewage always,—at times when it hurts the land as well as at times when the land wants it. But by laying out a portion of the land as a filter bed the sewage may be thrown on that whenever its presence on the remainder would do harm rather than good. Mr. Denton has applied this combined system in several instances, and insists, apparently with much reason, that such a combination offers a better prospect of profit than any other efficient mode of purifying sewage. The system of intermittent filtration through land has been recommended by the Royal Commission of 1882–84 as a mode of treating London sewage.

Intermittent filtration through land.

Combination of intermittent filtration with broad irrigation.

Filtration through Artificial Filters of sand, gravel, ashes, charcoal, coke, peat, etc., though often experimented on, can scarcely be described as an actual system. It is attended by the difficulty that the filter becomes speedily choked by the deposit of sludge. The intermittent use of a suitable artificial filter will, however, serve efficiently to oxidize and therefore purify the liquid portion of sewage from which the sludge has been previously precipitated, and filtration through coke is used in some instances as a supplement to the process which is next to be described.

Artificial filters.

Chemical Treatment, or Precipitation.—When sewage is allowed to stand, or to flow very slowly through a large tank, a gradual subsidence of the solid particles takes place. The subsidence is, however, much too slow to be complete before decomposition sets in. But it may be very greatly accelerated by the addition of certain reagents, with the object of producing a precipitate which, in falling, will carry down with it the minute particles of solid matter that are suspended throughout the mass. Lime is the substance most usually employed. It is introduced in the form of milk of lime, and in the proportion of about one ton of lime to one million gallons of sewage. When thoroughly mixed, the liquid is left at rest, and a rapid separation of the sewage follows, into a comparatively clear supernatant liquid and a glutinous precipitate or "sludge." The sludge has little value as manure, for the best agricultural constituents of sewage are contained in solution, and very little of the soluble matter is carried down in the deposit. The sludge is dried by being strained over beds of slag, pressed into blocks for transport, and got rid of by being burnt or dug into the ground or thrown into the sea. It has been used in the manufacture of bricks and of cement (Scott's process), but in general it can be disposed of only at a loss. The clarified effluent still contains dissolved organic matter, and may be admitted into running streams only when a high standard of purity is not compulsory. When, however, the volume of the running water which it enters is relatively very large a quick purification takes place by means of the oxygen which the water carries in solution.

Chemical treatment.

Lime process.

The lime process is practiced, without further purification of the effluent water, at Leeds and at Burnley. At Bradford, after precipitation by lime, the effluent is filtered through beds of coke-breeze. At Birmingham the sewage of 600,000 people, after clarification by lime (which also serves to neutralize the acid contributed by manufactories), is used to irrigate a farm of 1200 acres.

Very many patents have been obtained for the precipitation of sewage by other chemicals in place of or in addition to lime. In Hillé's process lime is the chief ingredient, with tar and chloride of magnesium or calcium added. At Coventry the precipitants are sulphate of alumina, protosulphate of iron, and lime, and the effluent is afterwards filtered through land, in the proportion of 1 acre to 5000 of the population.

Sillar's "ABC" process, worked by the Native Guano Company at Aylesbury, differs from others in producing a sludge which has considerable value as manure. An emulsion of clay and carbon with a little blood is first mixed with the sewage; a precipitating solution of alum is then added, and the mixture is allowed to settle. The process gives a remarkably clear effluent; practically the whole of the insoluble constituents of the sewage and a portion of the dissolved impurities are carried down in the precipitate, which when dried and ground along with some sulphate of magnesia, is sold under the name of native guano. The ABC process has been in successful use for nine years at Aylesbury, where the "guano" finds a sale at 70s. [$17] per ton. In 1870 the Rivers Pollution Commissioners reported unfavorably on the process, a fact which may have prevented its adoption by other towns, but it has since then received the approval of many specialists. A recent protracted investigation by Dr. C. M. Tidy and Professor Dewar showed that the percentage of oxidizable organic matter removed by the process ranges from 75 to 86—a result, in their judgment, satisfactory. At Leeds, where the process was tried for a time, it was given up because the effluent was purer than the river into which it ran, and the simple lime-process, which costs less, but gives a less clear effluent, was adopted in its place.

The ABC process.

Much difference of opinion still exists as to the relative merits of broad irrigation, filtration through land, and chemical treatment, as means of disposing of sewage. That either of the two first plans or a combination of them both can be made to yield a satisfactory solution of the sewage problem, from a hygienic point of view, seems unquestionable. That chemical treatment, especially if supplemented by filtration through land, will also purify well, is generally admitted. No process of effective purification is now expected to yield a profit; but the question of cost, on which the choice of a system principally turns, is too extensive to be touched in this article.

Relative merits of the systems.

II. The Conveyance of Sewage.—For small sewers, circular pipes of glazed earthenware or fire-clay or of moulded cement are used, from 6 inches to 18 inches and even 20 inches in diameter. The pipes are made in short lengths, and are usually jointed by passing the end or spigot of one into the socket or faucet of the next. Into the space between the spigot and faucet a ring of gasket or tarred hemp should be forced, and the rest of the space filled up with cement, not clay. The gasket prevents the cement from entering the pipe, and so obstructing the flow; at the same time it forms an elastic packing which serves to keep the successive lengths of pipe concentric, even if the cement should fail. The pipes are laid with the spigot ends pointing in the direction of the flow, with a uniform gradient, and, where practicable, in straight lines. In special positions, such as under the bed of a stream, cast-iron pipes are used for the conveyance of sewage. Where the capacity of an 18-inch circular pipe would be insufficient, built sewers are used in place of earthenware pipes. These are sometimes circular or oval, but more commonly of an egg-shaped section, the invert or lower side of the sewer being a curve of shorter radius than the arch or upper side. The advantage of this form lies in the fact that great varia-

Conveyance of sewage.

Pipe sewers.

Built sewers.

[1] *Report of the Rivers Pollution Commissioners*, 1870.

[2] J. Bailey-Denton, *Intermittent Downward Filtration, with notes on the Practice and Results of Sewage Farming*, 1st ed. 1880, 2d ed. 1885.

tions in the volume of flow must be expected, and the egg-section presents for the small or dry-weather flow a narrower channel than would be presented by a circular sewer of the same total capacity. Figs. 1 and 2 show two common forms of egg-sections, with dimensions expressed in terms of the diameter of the arch.

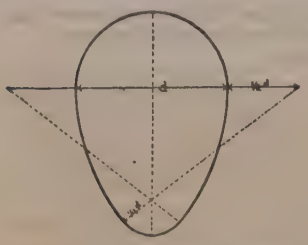

FIG. 1.

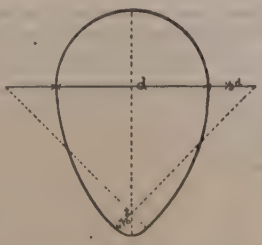

FIG. 2.

FIGS. 1, 2.—Forms of Sewers.

Fig. 2 is the more modern form, and has the advantage of a sharper invert. The ratio of width to height is 2 to 3.

Built sewers are most commonly made of bricks, moulded to suit the curved structure of which they are to form part. Separate invert blocks of glazed earthenware, terra-cotta, or fire-clay are often used in combination with brickwork. The bricks are laid over a templet made to the section of the sewer, and are grouted with cement. An egg-shaped sewer, made with two thicknesses of brick, an invert block, and a concrete setting, is illustrated in Fig 3. Concrete is

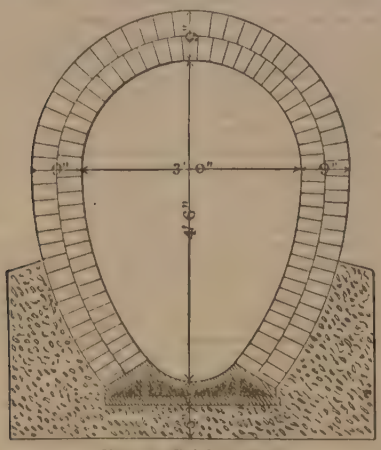

FIG. 3.—Brick Sewer.

now very largely used in the construction of sewers, either in combination with brick-work or alone. For this purpose the concrete consists of from 5 to 7 parts of sand and gravel or broken stone to 1 of Portland cement. It may be used as a cradle for or as a backing to a brick ring, or as the sole material of construction by running it into position round a mould which is removed when the concrete is sufficiently set, the inner surface of the sewer being in this case coated with a thin layer of cement.

Dimensions of sewers.

In determining the dimensions of sewers, the amount of sewage proper may be taken as equal to the water supply (generally about 30 gallons per head per diem), and to this must be added an allowance for the surface water due to rainfall. The latter, which is generally by far the larger constituent, is to be estimated from the maximum rate of rainfall for the district and from the area and character of the surface. In the sewerage of Berlin, for example (one of the most recent instances of the combined water-carriage system applied on a large scale), the maximum rainfall allowed for is ⅔ of an inch per hour, of which one-third is supposed to enter the sewers. In any estimate of the size of sewers based on rainfall account must of course be taken of the relief provided by storm-overflows, and also of the capacity of the sewers to become simply charged with water during the short time to which very heavy showers are invariably limited. Rainfall at the rate of 5 or 6 inches per hour has been known to occur for a few minutes, but it is altogether unnecessary to provide (even above storm-overflows) sewers capable of discharging any such amount as this; the time taken by sewers of more moderate size to fill would of itself prevent the discharge from them from reaching a condition of steady flow; and, apart from this, the risk of damage by such an exceptional fall would not warrant so great an initial expenditure. Engineers differ widely in their estimates of the allowance to be made for the discharge of surface water, and no rule can be laid down which would be of general application.

Velocity of discharge.

In order that sewers should be self-cleansing, the mean velocity of flow should not be less than 2½ feet per second. The gradient necessary to secure this is calculated on principles which have been stated in the article HYDROMECHANICS (*q.v.*). The velocity of flow, V, is

$$V = c\sqrt{im},$$

where i is the inclination, or ratio of vertical to horizontal distance; m is the "hydraulic mean depth," or the ratio of area of section of the stream to the wetted perimeter; and c is a coefficient depending on the dimensions and the roughness of the channel and the depth of the stream. A table of values of c will be found in § 90 of the article referred to. This velocity multiplied by the area of the stream gives the rate of discharge. Tables to facilitate the determination of velocity and discharge in sewers of various dimensions, forms, and gradients will be found in Mr. Latham's and other practical treatises.

Interception sewers.

Where the contour of the ground does not admit of a sufficient gradient from the gathering ground to the place of destination, the sewage must be pumped to a higher level at one or more points in its course. To minimize this necessity, and also for other reasons, it is frequently desirable not to gather sewage from the whole area into a single main, but to collect the sewage of higher portions of the town by a separate high-level or interception sewer.

Sewer gas.

Sewer gas is a term applied to the air, fouled by mixture with gases which are formed by the decomposition of sewage, and by the organic germs which it carries in suspension, that fills the sewer in the variable space above the liquid stream. It is universally recognized that sewer gas is a medium for the conveyance of disease, and in all well-designed systems of sewerage stringent precautions (which will be presently described) are taken to keep it out of houses. It is equally certain that the dangerous character of sewer gas is reduced, if not entirely removed, by free admixture with the oxygen of fresh air. Sewers should be liberally ventilated, not only for this reason, but to prevent the air within them from ever having its pressure raised (by sudden influx of water) so considerably as to force the "traps" which separate it from the atmosphere of dwellings.

Ventilation of sewers.

The plan of ventilation now most approved is the very simple one of making openings from the sewer to the surface of the street at short distances,—generally shafts built of brick and cement,—and covering these with metallic gratings. Under each grating it is usual to hang a box or tray to catch any stones or dirt that may fall through from the street, but the passage of air to and from the sewer is left as free as possible.

Manholes.

The openings to the street are frequently made large enough to allow a man to go down to examine or clean the sewers, and are then called "manholes." Smaller openings, large enough to allow a lamp to be lowered for purposes of inspection, are called "lampholes," and are often built up of vertical lengths of drain-pipe.

To facilitate inspection and cleaning, sewers are, as far as possible, laid in straight lines of uniform gradient, with a manhole or lamphole at each change of direction or of slope and at each junction of mains with one another or with branches. The sewers may advantageously be stepped here and there at manholes. Sir R. Rawlinson has pointed out that a difference of level between the entrance and exit pipes tends to prevent continuous flow of sewer gas towards the higher parts of the system, and makes the ventilation of each section more independent and thorough. When the gradient is slight, and the dry-weather flow very small, occasional flushing must be resorted to.

Flushing of sewers.

Flap valves or sliding penstocks are introduced at manholes; by closing these for a short time sewage (or clean water introduced for the purpose) is dammed up behind the valve either in higher parts of the sewer

or in a special flushing chamber, and is then allowed to advance with a rush. Many self-acting arrangements for flushing have been devised which act by allowing a continuous stream of comparatively small volume to accumulate in a tank that discharges itself suddenly when full. A very valuable contrivance of this kind is Mr. Rogers Field's siphon flush tank, shown in Fig. 4. When the liquid in

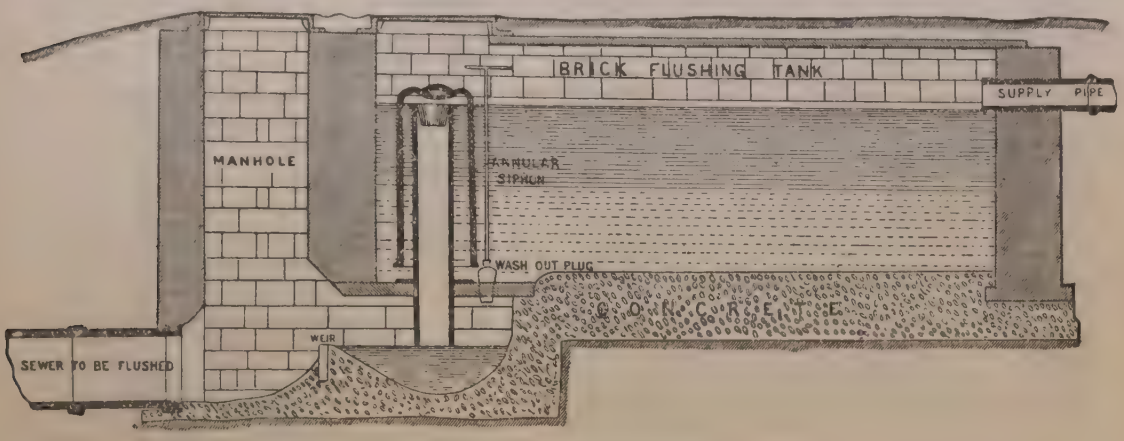

Fig. 4.—Field's Siphon Flush Tank.

the tank accumulates so that it reaches the top of the annular siphon, and begins to flow over the lip, it carries with it enough air to produce a partial vacuum in the tube. The siphon then bursts into action, and a rapid discharge takes place, which continues till the water level sinks to the foot of the bell-shaped cover.

III. Domestic Sewerage.—In the water-carriage system each house has its own network of drain-pipes, soil-pipes, and waste-pipes, which lead from the basins, sinks, closets, and gullies within and about the house to the common sewer. These must be planned to remove sewage from the house and its precincts quickly and without leakage or deposit by the way; the air within them must be kept out of the dwelling, by placing a water-trap at every opening through which sewage is to enter the pipes, and by making all internal pipes gas-tight; the pipes must be freely ventilated by a current of fresh air, in order to oxidize any deposited filth and to dilute any noxious gas they may contain; finally—and this is of prime importance—the air of the common sewer must be rigorously shut out from all drains and pipes within the house. To disconnect the pipes of each individual house from the atmosphere of the common sewer is the first principle of sound domestic sanitation. When this is done the house is safe from contagion from without, so far as contagion can come through sewer gas; and, however faulty in other respects the internal fittings may be, the house can suffer no other risk than that which arises from its own sewage.

Domestic sewerage.

Primary requisites.

Protection against the passage of gas through openings which admit of the entry of water is secured by the familiar device known as the water-trap.

Traps.

The simplest and in many respects the best form of trap is a bent pipe or inverted siphon (Fig. 5) which is sealed by water lying in the bend. The amount of the seal (measured by the vertical distance between the lines *a* and *b*) varies in practice from about ½ an inch to 3 inches. If the pressure of air within the pipe, below the trap, is greater than that of the air above the trap by an amount exceeding the pressure due to a column of water equal in height to the seal, the trap will be forced and air will bubble through. This is one way in which a trap may fail, but this may be prevented by sufficient ventilation of the pipe below the trap. Other possibilities of failure are, however, only too numerous. If the pipe is disused for some time, the water may evaporate so considerably as to break the seal. The pipe, if of lead, may bend out of shape, or it may even be so badly set in the first instance as to make the trap inoperative. The seal may be broken by the capillary action of a thread or strip of cloth, hanging over the lip of the trap and causing the water to drain away. A rush of water down the pipe, suddenly arrested, may pass the trap with such momentum as to leave it wholly or partly empty. Another and a common cause of failure can be explained by reference to Fig. 5. Let a column of water rush down the soil-pipe *c* from a closet or sink which discharges into it at some higher point. As the water passes the junction with the branch *d* it will produce a partial vacuum in the branch, and so tend to suck over the contents of the trap. This process, which is sometimes called the siphonage of traps, can be guarded against by ventilating the branch, either by a separate ventilating pipe leading to the open air or by a pipe *e* (shown by dotted lines) connecting the top of the branch *d* with a point sufficiently far up on the soil-pipe to be above the column of water which is passing the junction. One more imperfection in traps may be named. The experiments of Dr. Fergus have shown that the water in traps will allow gases to pass through by absorbing the gas on one surface and giving it off at the other. It is improbable that this action occurs to such an extent as to be dangerous by permitting the transfer of disease germs from one to the other side. Apart from any risk of this kind, however, it is clear that a trap is open to so many possibilities of failure as to form a very insufficient barrier between the air of a room and the foul air of a sewer. Nevertheless the practice was until very lately almost universal, and is still far from uncommon, of connecting closets, sinks, and even bedroom basins with common sewers by a continuous system of piping, in which the only safeguard against the entry of sewer gas is a single trap close to each sink or basin. This means that sewer gas, charged with the infection of a whole community, is brought within a few inches of the atmosphere of the dwelling, ready to contaminate it whenever the trap fails from any of the causes which have been named, or whenever, by a flow of water

Common trap.

Possible causes of failure.

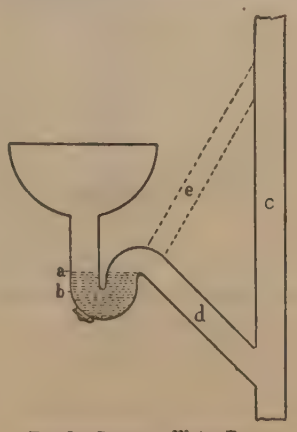

Fig. 5.—Common Water-Trap.

through it, the seal is sufficiently disturbed to allow bubbles of gas to escape into the room.

Disconnecting trap on house-drain.

The remedy for this lies in having, at any convenient point on each house-drain, a disconnecting trap which separates the house system from the sewer, and so establishes what may be called an outer line of defence. Any accidental leakage of sewer gas through it then does no more than cause a comparatively slight pollution of the air within the house-drains, and if these are well ventilated the effects of this are insensible. At each individual basin or other fitting a trap is still required, but its function is now merely to shut out the air of the house-drains from the rooms, and, as the air of the house-drains is no longer polluted by connection with the sewers, the occasional failure of this function is a matter of comparatively small moment. Further, the disconnecting trap on the house-drain furnishes a convenient place of access for fresh air; and the ventilation is completed by carrying the highest point of each soil-pipe or waste-pipe up to the level of the roof and leaving it open there. This arrangement will be understood by reference to Fig. 6, which shows a soil-pipe, open at its upper end, discharging into a house-drain in which there is a disconnecting trap provided with an open grating for the entry of air. The soil-pipe is ventilated by a current of air which (usually if not always) flows upwards. This not only dilutes any gases that are produced in the pipe, but quickly oxidizes any foul matter that may adhere to the sides. Care must be taken to avoid having

Ventilation of soil-pipes.

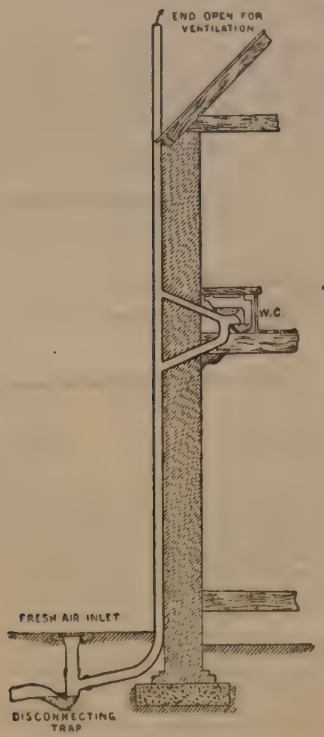

FIG. 6.—House-Drain properly disconnected from sewer, and ventilated.

the upper end of the pipe open near windows or under eaves. In the figure the branch leading to a water-closet is ventilated by a pipe carried into an upper part of the soil-pipe; this is scarcely necessary if the branch be short. Another construction is to carry a distinct ventilating pipe up from the top of the branch to a point above the roof; and where several fittings discharge into one soil-pipe, the same ventilating pipe may be made to serve for all. An example of the latter arrangement is shown in Fig. 10. The form of disconnecting trap shown in Fig. 6 is that of Mr. W. P. Buchan of Glasgow, who has done excellent service to the cause of sanitary reform by practicing and advocating the disconnection and ventilation of house-drains and soil-pipes. The same trap is shown to a larger scale in Fig. 7, where it appears imbedded in concrete and covered by a built manhole, which gives access to the trap in case of its becoming choked. The

Buchan trap.

manhole may have an open grating at the top; or the top may be closed by a solid plate (if a grating there be for any reason inadmissible), in which case a ventilating shaft is carried from the manhole to some other opening. Fig. 7

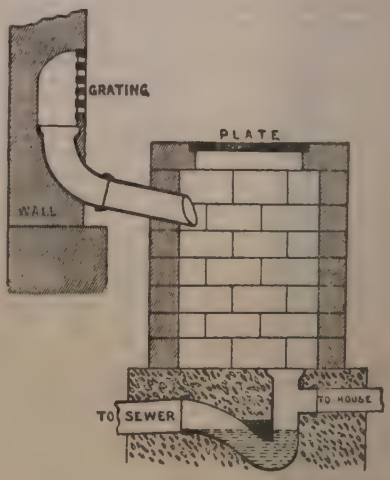

FIG. 7.—Buchan Trap and Manhole, with ventilating grating in wall.

shows such a shaft leading to a grating which is placed vertically in a neighboring wall. Among other good forms of disconnecting trap, more or less like Buchan's, mention may be made of Weaver's, Potts's, and Hellyer's.

An arrangement of double disconnecting trap is illustrated in Fig. 8. Any sewer gas forcing the trap next the sewer is still kept back by the upper trap and will escape by a grating or open ventilating shaft which enters at A, while air to ventilate the house-drain enters the upper trap from the manhole. This arrangement no doubt gives more absolute protection than a single trap of the kind already described, but it is probable that (except in cases where the sewers are very foul and liable to frequent excess of pressure) the advantage is so slight as to be more than counterbalanced by the greater liability to accidental stop-

Double disconnecting trap.

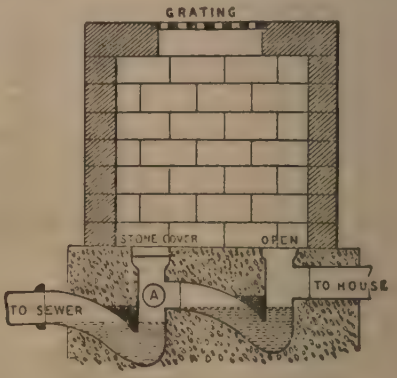

FIG. 8.—Double Disconnecting Trap.

page and greater complexity which this arrangement entails.

The extent to which it is permissible or advisable in practice to allow several fittings to discharge into a single waste-pipe or soil-pipe will vary in different cases. We can recognize a broad distinction between sewage from closets and urinals, liable to the most dangerous taint should disease occur within the house, and the comparatively innocuous sewage that comes from basins, baths, and sinks. Some sanitarians go so far as to advise that these two classes of sewage should be kept absolutely apart within the house, by the use of a complete double system of house drain-pipes. This, however, is an extreme measure; no reasonable objection can be urged against the discharge into a water-closet soil-pipe of water from a bath or washhand basin in the same room, except perhaps that if

Discharge from basins, sinks, etc.

the soil-pipe is of lead its corrosion is hastened by hot water; and the additional flushing which the soil-pipe so receives is a distinct advantage. But to connect a water-closet soil-pipe with sinks and basins in other apartments is to multiply possibilities for the spread of disease within the house, and it is strongly advisable to convey the waste from them by a separate pipe, protected from the sewer by a disconnecting trap of its own with a grating open to the air. This applies with special force to the washhand basins that are often fixed in bedrooms and dressing-rooms. Nothing could be more dangerous than the usage—of which many good houses still furnish instances—of multiplying these conveniences without regard to the risk they involve, and making this risk as great as possible by placing each in direct communication through an ordinary trap with the soil-pipe, itself perhaps unventilated and provided with no disconnection from the sewer. Even when the drain or soil-pipe is ventilated and disconnected from the sewer, no bedroom basin should, under any circumstances, be allowed to discharge into it without first passing a separate open trap. On the other hand, a bedroom basin may be made perfectly safe by leading its waste-pipe (trapped under the basin in the usual way) into an open-air channel which communicates with the sewer by a surface-trap or gully outside the house (Fig. 9). Similar treatment should be adopted in the case of

Bedroom basins.

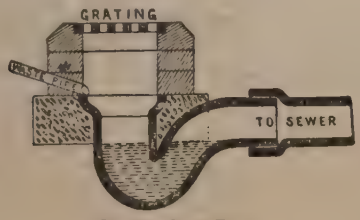

FIG. 9.—Open Trap.

pantry and scullery sinks. Under most plumbing fixtures it is usual to place a safe-tray to receive any water accidentally spilt. The discharge-pipes from these trays are sometimes, but very objectionably, led into the waste-pipe or soil-pipe below the fixture. The proper method of providing for the discharge of water spilt into the safe-tray is to lead a pipe from it through the wall and allow it to end in the open air (Fig.

10, where each of the safe-tray drains is marked "waste-pipe"); a flap valve fixed on the end will serve, if need be, to keep out draught.

Overflow pipes from cisterns used for dietetic purposes should be led, in the same way, into the open air and not into soil-pipes or waste-pipes (Fig. 10). Traps on them cannot be depended on to remain sealed, and any connection of an overflow-pipe with a soil-pipe would result in allowing foul air from the pipe to diffuse itself over the surface of water in the cistern—a state of things peculiarly likely to cause pollution of the water. When a cistern is used only for water-closet service, its overflow-pipe may properly be led into the basin of the closet.

Cistern overflows.

Rain-pipes, extending as they do to the roof, are sometimes used to serve as ventilating continuations of soil-pipes and waste-pipes. The practice is open to serious objection, for it discharges the drain air just under the eaves, at a place where air is generally being drawn into the house. The ventilating end of a soil-pipe should be carried to a higher level, as in Fig. 6, clear of the lower edge of the roof. It is better to restrict rain-pipes to their legitimate function of taking surface water from the roof, or at most to allow them to receive slop-water from sinks and basins, and to make them terminate in or over open traps from which a connection is taken to the house-drain or sewer (Fig. 9).

Rain-pipes.

In Figs. 10 and 11 the sanitary fittings of a small house are shown by diagrams, which should be carefully studied as exemplifying a well-arranged system. Two closets, and a bath and basin in the closet apartment, discharge into a soil-pipe on the right, and the branches (except that of the basin) are ventilated by pipes leading to a separate air-pipe, which, like the soil-pipe, is carried above the roof. The overflow of a cistern which supplies bath, basin, and boiler is carried out to the open air, and so are the waste-pipes of the leaden safe-trays. A separate cistern supplies each water-closet, and its overflow opens into the closet basin. A rain-pipe (in the middle of the figure) receives a bedroom basin waste, and leads by a 4-inch drain to a ventilated grease-box, into which the scullery sink and wash-tubs and another rain-pipe also discharge. Finally, the whole system is protected

Complete system for a small house.

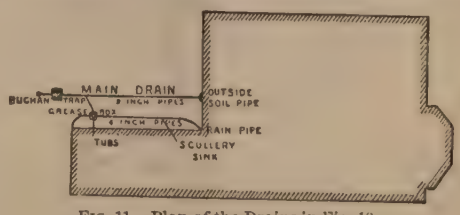

FIG. 11.—Plan of the Drains in Fig. 10.

by a Buchan trap in a built manhole, which is covered with a grating.

House-drains, that is to say, those parts of the domestic system of drainage which extend from the soil-pipes and waste-pipes to the sewer, are made of glazed fireclay pipes, generally 6 inches but sometimes only four inches in diameter. A larger size than 6 inches is rarely if ever desirable. The pipes are spigot-and-faucet jointed, and the joints should be made with cement in the manner already described for sewers. When, as is often unavoidable, the house-drain has to pass under a part of the house, or to come from

House-drains.

Soil-pipes.

back to front, iron pipes jointed with lead and coated with an anti-corrosive compound are preferred to fireclay pipes, as giving a better security against the production of leaks by the settling of the soil and other causes. Soil-pipes, when carried down inside the house, are of either lead or iron; when outside the house they are usually of iron. An outside soil-pipe is obviously preferable to an inside one; if the arrangement of the building makes an inside soil-pipe necessary, care must be taken that it shall be easily accessible for inspection at all parts of its length. The usual diameter is 4 inches. For the sake of good ventilation it is desirable to continue the soil-pipe to a point above the roof without reduction of diameter rather than apply a smaller ventilating pipe. Amongst reasons for ventilation one remains to be mentioned,—that owing to the corrosive action of sewer gas, the life of the soil-pipe is greatly shortened if provision for the free circulation of air be wanting or insufficient. A closed soil-pipe becomes in time pitted with holes, especially in the upper parts of its length.

Defective joints in soil-pipes and waste-pipes, particularly where they connect with drains, closet-basins, sinks, etc., are another frequent cause of leakage. Any want of air-tightness in drains or soil-pipes within a dwelling leads to the pollution of the air,

Danger of leaks.

not merely by diffusion, but by an actual in-draught, for generally the air of the house has its pressure reduced by chimney draughts to a value slightly lower than that of the air outside. The house, in fact, ventilates itself by drawing in air from the pipe at any hole, a fact which may easily be demonstrated by holding the flame of a taper near the hole.

Smoke-test.

Various experimental methods are used of detecting such leaks as would admit foul air to the dwelling. Of these the best is the "smoke test." It consists of filling the house-drain, soil-pipes, and waste-pipes with a dense and pungent smoke, any escape of which into the house is readily observed by eye and nose. A quantity of cotton-waste soaked in oil is lighted, and its fumes are blown into the house-drain by a revolving fan, at the ventilating cover of the disconnecting trap, or at any other convenient opening. Smoke soon fills the pipes, and begins to escape at the roof. The upper ends of the pipes are then closed, and the house is searched for smoke.[1]

Hydraulic test.

Another test, especially applicable to those parts of drains that are laid under houses, is the hydraulic test, which consists in stopping up the lower end of the pipe, filling it with water so as to produce a moderate pressure, and then observing whether the level of the water falls. This test, however, is too severe for any but new and very well constructed drains.

Traps on individual fittings.

Every basin, sink, or other fitting should be separately trapped by a bend on the waste-pipe or some other form of trap. A brass cap, screwed on a ferrule which is let into the pipe on the bend, facilitates cleaning (Fig. 5). The warm waste-water from pantry and scullery sinks contains much grease, and should be discharged into a grease box (Fig. 12) where

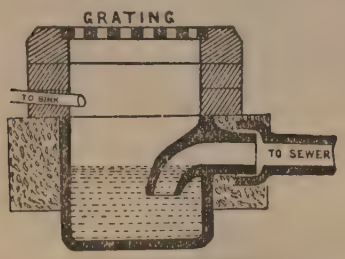

FIG. 12.—Grease Trap.

the water becomes cool and deposits its grease before overflowing into the drain. To collect surface water from laundry floors, areas, court-yards, etc., an open trap or gully is used. Fig. 9 shows a simple and good form of open trap; but if the water is liable to carry down sand or earth a gully (Fig. 13) is more suitable.

Open traps and gullies.

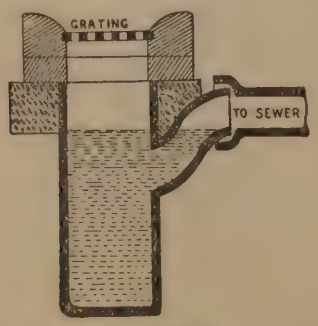

FIG. 13.—Gully-Trap.

Even in this simple fitting a remarkable ingenuity of error has been displayed. Many of the forms favored by builders are bad either because of an insecure seal, a narrow outlet, or a tendency to gather filth. One in particular, the well-known "Bell" trap, is an example of nearly everything a trap should not be.

Water-closets.

Water-closets used to be almost invariably of the "pan" type, but wherever sanitary reform has been preached to any purpose the pan-closet is giving place to cleaner and wholesomer patterns. The evils of the pan closet will be evident from an inspection of Fig. 14. At each use of the closet the hinged pan *a* is tilted down so that it discharges its contents into the container *b*. The sides of the container are inaccessible for cleaning, and their upper portions are out of reach of the flushing action of the pan. They gradually become coated with a foul deposit. A gust of tainted air escapes at every use of the closet; and it rarely happens

Pan-closet.

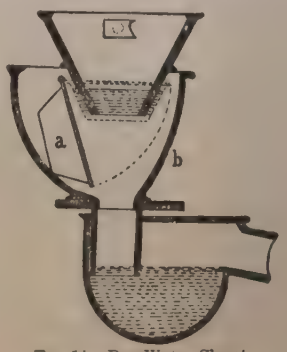

FIG. 14.—Pan Water-Closet.

that the container is air-tight, and that the filth it has gathered does not cause a smell even in intervals of disuse. To make matters worse, many of the older pan-closets are provided with the kind of trap shown in the sketch, called the D trap, which is also liable to become a gathering place for filth. Even with an ordinary trap, however, the pan-closet remains so bad that its use is to be strongly condemned.

Valve closets.

A much better closet is the valve or Brahma closet, an excellent example of which by Frew of Perth is shown in Fig. 15. The basin is kept partly full of water by a ground gun-metal valve tightly pressed up against a conical seat at the basin's foot. The chamber below is only large enough to allow the valve to turn down; it cannot collect much foul matter and may be

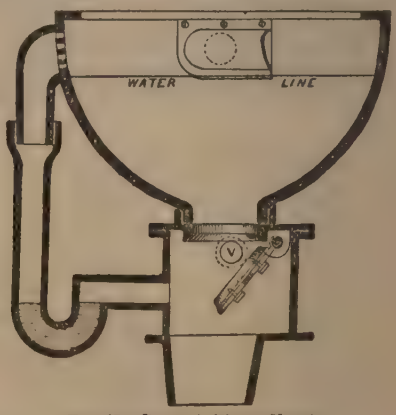

FIG. 15.—Bramah Water-Closet.

ventilated by a separate pipe. A trapped overflow prevents the basin from being overfilled. The whole closet is trapped by an ordinary bend on the soil-pipe, which is not shown in the figure. The volume of water in the basin is much greater than in pan-closets, where the height is limited by the overflow which occurs round the lip of the pan. In some closets of this kind the valve is placed at the side, and, when closed, lies nearly vertical. In another type of valve closet (Jenning's) the valve is a conical plug, pressed vertically down on a seat at the side.

Washout closet.

Valve closets can be made fairly effective and satisfactory from a sanitary point of view; but a much cheaper and certainly not less excellent type of closet is the "washout," an example of which (the "National") is shown in Fig. 16. (Another washout closet, by Doulton, appears in Fig. 6.) These are now made in a great variety of good forms, sometimes of a single piece of white stoneware. They combine cheapness and simplicity with a degree of sanitary perfection that is probably not reached by the most expensive closets of the kinds already named. They have no working parts; the closet is cleansed after use simply by the flush of water, which sweeps every-

[1] A novel plan of making the smoke test has lately been introduced, in which smoke is given off by a "smoke rocket" or cake of slowly combustible compound which is lighted and placed in the drain.

thing before it. The flush must of course be good: a 1½-inch service pipe from a cistern not less than 5 feet above the closet will do well. In some recent designs the cistern is a box at the back of the seat with a wide oval mouth

FIG. 16.—Washout Water-Closet.

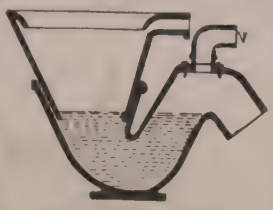

FIG. 17.—Hopper Closet.

leading from it to the flushing rim of the pan: this gives a good flush although the cistern is low. A feature of construction which may be strongly recommended is to leave the closet entirely open for inspection and cleaning, instead of concealing it in a wooden case. The seat then generally rests on iron brackets projecting from the wall, and can be raised on hinges at the back, so that the pan may be used as a urinal or slop-sink without the risk of fouling. Another good type of closet, sharing with the washout the advantage of having no mechanical parts, is the "hopper," illustrated in Fig. 17 (Dodd's Hopper). In all these closets the horn marked V is for attaching a ventilating pipe.

Hopper closet.

For the supply of water to a closet a separate cistern is desirable, especially when water for dietetic purposes is liable to be drawn from the main cistern (instead of being taken direct from the water service-pipe, which is better). It would seem needless to add, were it not that such faults are common, that no cistern—unless it be exclusively used for

Service cisterns for closets.

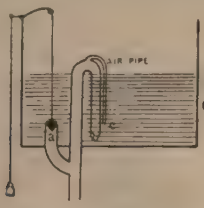

FIG. 18.—Water-Closet Cistern with Siphon Flush.

water-closet supply—should be placed in the same room with or just under a water-closet, and that the room itself should be well lighted, well ventilated, and well shut off from bedrooms. To prevent flushing of closets from being imperfect through carelessness, many plans have been devised for ensuring that once the flow of water is started it will continue until a given volume has been discharged. One of the best of these is the arrangement of siphon flush sketched in Fig. 18: when the valve *a* is opened the downrush of water starts the siphon *b* into action, and even should *a* be then closed the flow continues until the water-level falls to *c*, when air is admitted and the siphon ceases to act. The air-pipe *c* is cut to give the desired volume.

Automatic flush.

As regards house-drainage generally, the points of chief importance may be briefly summed up as follows: (1) the use of one or more disconnecting traps to shut off sewer gas from the whole system of house-drains and pipes; (2) the thorough ventilation of house-drains, soil-pipes, and branches, by providing openings through which air can enter at the foot and escape at the top; (3) the discharge of all sinks, basins, etc., other than water-closet fittings, and especially of fixed bedroom basins, into open traps in the open air; (4) the direct discharge of cistern overflows and safe-trays into the open air; (5) the use of cleanly and well-designed closets, basins, etc., each sealed by an ordinary bent trap; (6) the use of separate service cisterns for water-closets.

Summary.

It may seem superfluous to add that the system of pipes must provide a rapid and effective carriage of all sewage to the sewer, and must be water-tight and air-tight. During the last five years, however, it has been proved, by examination of the best houses in London, that it is no uncommon case for a house to be so completely without effective connection with the sewer that all its own sewage sinks into the soil under the basement; and about 75 per cent. of the houses inspected have failed to pass the "smoke test."

Actual state of London houses.

In this connection mention should be made of the system of coöperative house-inspection originated by the late Prof. Fleeming Jenkin. The Edinburgh Sanitary Protection Association was founded by him in 1878 to carry out the idea that the sanitary fittings of a house should be periodically submitted to examination by an expert, and that householders should combine to secure for this purpose the continuous service of an engineer able to detect flaws, to advise improvements, and to superintend alterations. The Edinburgh association soon justified its existence by discovering, in the houses of its members, a state of things even worse than students of sanitary science had imagined possible. Similar associations are now doing excellent work in London, Glasgow, and many other large towns.

Coöperative system of periodic inspection.

Space admits of only a very brief mention of those systems of sewerage in which excreta are not removed by the aid of water. The dry-earth system, introduced by the Rev. H. Moule, takes advantage of the oxidizing effect which a porous substance such as dry earth exerts by bringing any sewage with which it is mixed into intimate contact with the air contained in its pores. A discharge of urine and fæces is quickly and completely deodorized and absorbed when covered with a small quantity of dry earth; and the same soil, if exposed to the air and allowed to dry, may be used over and over again for the same purpose. Even after soil has been several times used, however, its value as manure is not so great as to pay for its transport to any considerable distance; and for this reason, as well as from the fact that it leaves other constituents of sewage to be dealt with by other means, the system is of rather limited application. So far as it goes it is excellent, and where there is no general system of water-carriage sewerage, or where the water-supply is small or uncertain, an earth-closet will, in careful hands, give perfect satisfaction. Numerous forms of earth-closet are sold in which a suitable quantity of earth is automatically thrown into the pan at each time of use. Arrangements of this kind are, however, not necessary to the success of the system; a box filled with dry earth and a hand scoop will answer the purpose not less effectively. Ashes are sometimes substituted for or mixed with the dry earth, and powdered charcoal is also used.

Dry-earth system.

Earth-closets.

The most primitive method of dealing systematically with excreta is to collect the discharges directly in a vessel which is either itself carried to the country, and its contents applied to the land, or is emptied into a more portable vessel for that purpose. In Japan, for example, in spite of the difficulty of transport over bad roads and by human labor, the latter plan is universally followed: the land and the people have in fact performed for centuries what may be called a complete cycle of operations. The agricultural return is so good that farmers pay for leave to remove excrement, and householders look to their discharges as a source of income. The plan, although carried out in the roughest manner, appears to involve fewer sanitary drawbacks than might be expected; but the smells from privies and carts, and above all, from the process of emptying by ladle, are a nuisance which no Western community would tolerate. A simple pail system, in which the sewage is collected and removed in the same vessel, has been used at Rochdale; another, with an absorbent lining in the pails, at Halifax. A plan much used in Continental cities is to collect excrement in tight vaults, which are emptied at intervals into a tank cart by a suction pump or injector. A more recent pneumatic system is that of Liernur, applied at Amsterdam, where sewage reservoirs at individual houses are permanently connected with a central reservoir by pipes, through which the contents of the former are sucked by exhausting air from the reservoir at the central station. A similar plan has been tried at Lyons and Paris by M. Berlier.

Pail systems.

Pneumatic systems.

References.—The blue-book literature of sewage disposal is very voluminous. Special reference should be made to the *Reports of the Rivers Pollution Commissioners*, from 1866; *Reports of the Referees on Metropolitan Main Drainage*, 1857; *Reports of the Commission on the Sewage of Towns*, 1858–1865; *Reports of Select Committees of the House of Commons*, 1862 and 1864; *Reports of the British Association Committee on the Treatment and Utilization of Sewage*, 1869–1876; *Re-*

port of the Birmingham Sewage Inquiry Committee, 1871; *Reports of the Local Government Board; Reports of the Royal Commission on Metropolitan Sewage Discharge*, 1884 (the second and final report contains a valuable historical résumé of the subject). See also the following books: Corfield, *Treatment and Utilization of Sewage*, 1871; Burke, *Handbook of Sewage Utilization*, 1873; Robinson and Melliss, *Purification of Water-carried Sewage*, 1877; Robinson, *Sewage Disposal*, 1882; J. Bailey-Denton, *Intermittent Downward Filtration*, 2d ed., 1885. Engineering details of sewerage are given in Baldwin Latham's *Sanitary Engineering*, 2d ed., 1878; and particulars of the drainage of individual towns will be found in numerous papers in the *Minutes of Proceedings* of the Institution of Civil Engineers. The domestic aspect of sewerage has been treated by J. Bailey-Denton, *Handbook of House Sanitation*, 1882; W. P. Buchan, *Plumbing and House Drainage*, 4th ed., 1883; W. Eassie, *Healthy Houses*, 1876; Gerhard, *House Drainage*, New York, 1882; Waring, *Sanitary Drainage of Houses and Towns*, Boston, 4th ed., 1883; F. Jenkin, *Healthy Houses*, 1878; and many other writers.

SEWIN, or SEWEN. See SALMONIDÆ, vol. XXI. p. 233.

SEWING-MACHINES. The sewing-machine, as is the case with most mechanical inventions, is the result of the efforts of many ingenious persons, although it would appear that the most meritorious of these worked in entire ignorance of the labors and successes of others in the same field. Many of the early attempts to sew by machinery went on the lines of imitating ordinary hand-sewing, and all such inventions proved conspicuous failures. The method of hand-sewing is of necessity slow and intermittent, seeing that only a definite length of thread is used, which passes its full extent through the cloth at every stitch, thus causing the working arm, human or otherwise, to travel a great length for every stitch made, and demanding frequent renewals of thread. The foundation of machine-sewing was laid by the invention of a double-pointed needle, with the eye in the centre, patented by Charles F. Weisenthal in 1755. This device was intended to obviate the necessity for inverting the needle in sewing or embroidering, and it was subsequently utilized in Heilman's well-known embroidery machine.

Many of the features of the sewing machine are distinctly specified in a patent secured in England by Thomas Saint in 1790, in which he, *inter alia*, describes a machine for stitching, quilting, or sewing. Saint's machine, which appears to have been intended principally for leather work, was fitted with an awl which, working vertically, pierced a hole for the thread. A spindle and projection laid the thread over this hole, and a descending forked needle pressed a loop of thread through it. The loop was caught on the under side by a reciprocating hook; a feed moved the work forward the extent of one stitch; and a second loop was formed by the same motions as the first. It, however, descended within the first, which was thrown off by the hook as it caught the second, and being thus secured and tightened up an ordinary tambour or chain stitch was formed. Had Saint hit on the idea of the eye-pointed needle his machine would have been a complete anticipation of the modern chain-stitch machine.

The inventor who first devised a real working machine was a poor tailor, Barthélemy Thimonier, of St. Étienne, who obtained letters patent in France in 1830. In Thimonier's apparatus the needle was crocheted, and descending through the cloth it brought up with it a loop of thread which it carried through the previously made loop, and thus it formed a chain on the upper surface of the fabric. The machine was a rather clumsy affair, made principally of wood, notwithstanding which as many as eighty were being worked in Paris in 1841, making army clothing, when an ignorant and furious crowd wrecked the establishment and nearly murdered the unfortunate inventor. Thimonier, however, was not discouraged, for in 1845 he twice patented improvements on it, and in 1848 he obtained both in France and the United Kingdom patents for further improvements. The machine was then made entirely of metal, and vastly improved on the first model. But the troubles of 1848 blasted the prospects of the resolute inventor. His patent rights for Great Britain were sold; a machine shown in the Great Exhibition of 1851 attracted no attention, and Thimonier died in 1857 unfriended and unrewarded.

The most important ideas of an eye-pointed needle and a double thread or lock-stitch are strictly of American origin, and that combination was first conceived by Walter Hunt of New York about 1832–34. Hunt reaped nothing of the enormous pecuniary reward which has been shared among the introducers of the sewing-machine, and it is therefore all the more necessary that his great merit as an inventor should be insisted on. He constructed a machine having a vibrating arm, at the extremity of which he fixed a curved needle with an eye near its point. By this needle a loop of thread was formed under the cloth to be sewn, and through that loop a thread carried in an oscillating shuttle was passed, thus making the lock-stitch of all ordinary two-thread machines. Hunt's invention was purchased by a blacksmith named Arrowsmith, and a good deal was done towards improving its mechanical details, but no patent was sought, nor was any serious attempt made to draw attention to the invention. After the success of machines based on his two devices was fully established, Hunt in 1853 applied for a patent; but his claim was disallowed on the ground of abandonment. The most important feature in Hunt's invention—the eye-pointed needle—was first patented in the United Kingdom by Newton and Archbold in 1841, in connection with glove-stitching.

Apparently quite unconscious of the invention of Walter Hunt, the attention of Elias Howe, a native of Spencer, Mass., was directed to machine-sewing about the year 1843. In 1844 he completed a rough model, and in 1846 he patented his sewing-machine (Fig. 1). Howe was thus the first to patent a lock-

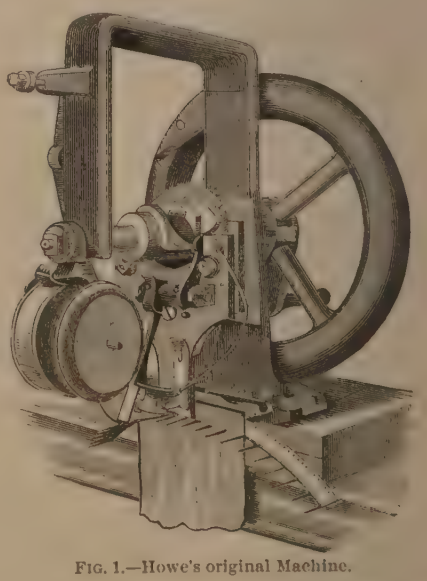

FIG. 1.—Howe's original Machine.

stitch machine, but his invention had the two essential features—the curved eye-pointed needle and the under-thread shuttle—which undoubtedly were invented by Walter Hunt twelve years previously. Howe's invention was sold in England to William Thomas of Cheapside, London, a corset manufacturer, for £250 [$1215]. Thomas secured in December, 1846, the English patent in his own name, and engaged Howe on weekly wages to adapt the machine for his manufacturing purposes. The career of the inventor in London was chequered and unsuccessful; and, having pawned his American patent rights in England, he returned in April, 1849, in deep poverty to America. There in the meantime the sewing-machine was beginning to excite public curiosity, and various persons were making machines which Howe found to trench on

his patent rights. The most prominent of the manufacturers, if not of inventors, ultimately appeared in the person of Isaac Merritt Singer, who in 1851 secured a patent for his machine (Fig. 2), and immediately

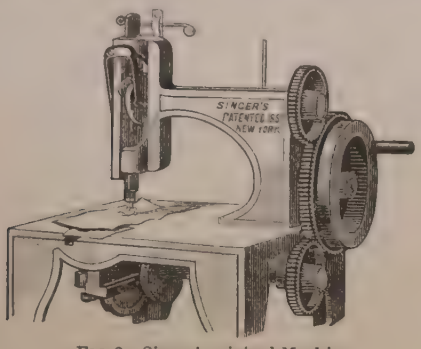

FIG. 2.—Singer's original Machine.

devoted himself with immense energy to push the fortunes of the infant industry. Howe now became alert to vindicate his rights, and after regaining possession of his pawned patent, he instituted suits against the infringers. An enormous amount of litigation ensued, in which Singer figured as a most obstinate defendant, but ultimately all makers became tributary to Elias Howe. It is calculated that Howe received in the form of royalties on machines made up to the period of the expiry of his extended patent—September, 1867—which was also the month of his death, a sum of not less than two millions of dollars.

The practicability of machine-sewing being demonstrated, inventions of considerable originality and merit followed in quick succession. One of the most ingenious of all the inventors—who worked also without knowledge of previous efforts—was Mr. Allan B. Wilson. In 1849 he devised the rotary hook and bobbin combination, which now forms the special feature of the Wheeler & Wilson machine. Mr. Wilson obtained a patent for his machine, which included the important and effective four-motion feed, in November, 1850. In February, 1851, Mr. William O. Grover, tailor, of Boston, patented his double chain-stitch action, which formed the basis of the Grover & Baker machine. At a later date, in 1856, Mr. James A. E. Gibbs, a Virginia farmer, devised the improved chain-stitch machine now popularly known as the Wilcox & Gibbs. These together—all American inventions—form the types of the various machines now in common use. Several thousands of patents have been issued in the United States and Europe, covering improvements in the sewing-machine; but, although the efficiency of the machine has been greatly increased by numerous accessories and attachments, the main principles of the various machines have not been affected thereby.

In machine-sewing there are three varieties of stitch made,—(1) the simple chain or tambour stitch, (2) the double chain-stitch, and (3) the lock-stitch. In the first variety the machine works with a single thread; the other forms use two, an upper and an under thread.

The structure of the chain-stitch is shown in Fig. 3. The needle first descends through the cloth, then as it begins to

FIG. 3.—Chain-Stitch.

ascend the friction of the thread against the fabric is sufficient to form a small loop into which the point of a hook operating under the cloth plate enters, expanding and holding the loop while the needle rises to its full height. The feed then moves the fabric forward one stitch length, the hook with its loop is also projected so that when next the needle descends its loop is formed within the previous loop. The hook then releases loop No. 1, seizes and expands loop No. 2, and in so doing draws up the previous loop into a stitch, chain-like on the under side but plain on the upper surface of the fabric. The seam so made is firm and elastic, but easily undone, for if at any point a thread is broken the whole of the sewing can be readily run out backwards by pulling the thread, just as in crochet work. To a certain extent this imperfection in the chain-stitch machine is overcome in the Wilcox & Gibbs machine, in which each loop is, by means of a rotating hook, twisted half a revolution after it has passed through its predecessor.

The double chain-stitch is made by machines associated with the name of Grover & Baker. The somewhat compli-

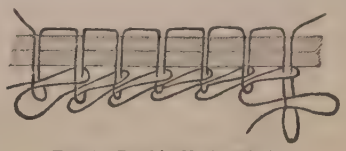

FIG. 4.—Double Chain-Stitch.

cated course of the threads in this stitch is shown in Fig. 4. The under thread in this machine is supplied from an ordinary bobbin and is threaded through a circular needle of peculiar form. The machine is wasteful of thread, and the sewing forms a knotted ridge on the under side of the fabric. Except for special manufacturing and ornamental purposes the machine is now in little use.

The lock-stitch is that made by all ordinary two-thread sewing-machines, and is a stitch peculiar to machine-sewing. Its structure is, as shown in Fig. 5, very simple, and

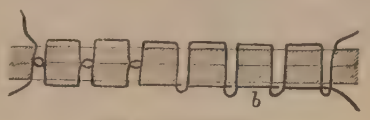

FIG. 5.—Lock-Stitch.

when by proper tension the threads interlock within the work the stitch shows the same on both sides and is very secure. When, however, the tension on the upper thread is weak, the under thread runs along the surface as at *b*, held more or less tightly by the upper loops. It will be seen that to make the lock-stitch the under thread has to be passed quite through the loop of the upper thread. That is done in two principal ways. By the first plan a

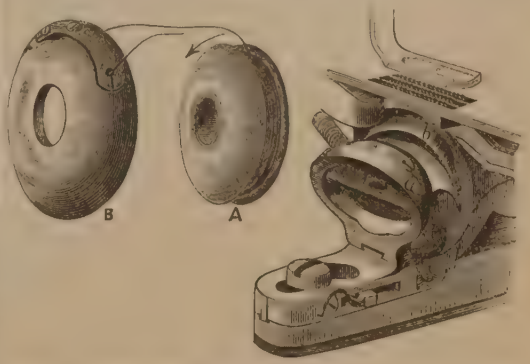

FIG. 6.—Rotary Hook, Bobbin, and Bobbin Case (Wheeler & Wilson Machine).

small metal shuttle, holding within it a bobbin of thread, is carried backward and forward under the cloth plate, and at each forward movement it passes through the upper thread loop formed by each succeeding stroke of the needle. Such is the principle devised by Hunt, introduced by Howe, and improved by Singer and many others. The second principal method of forming the lock-stitch consists in seizing the loop of the upper thread by a rotating hook, expanding the loop and passing it around a stationary bobbin within which is wound the under thread. The method is the invention of Mr. A. B. Wilson, and is known generally as the Wheeler & Wilson principle. The rotary hook seen at *b*, Fig. 6, is so bevelled and notched that it

opens and expands the upper thread loop, causing it quite to enclose the bobbin of under thread, after which it throws it off and the so-formed lock-stitch is pulled up and tightened either by an independent take-up motion as in recent machines, or by the expansion of the next loop as in the older forms. The bobbin A, lenticular in form, and its case B, Fig. 6, fit easily into a circular depression within the hook, against which they are held by the bobbin-holder *a*, Fig. 6.

Intermediate between the shuttle and the rotary-hook machines is the new oscillating-shuttle machine introduced by the Singer Co. The shuttle is hook-formed, not unlike the Wilson hook, and it carries within it a capacious circular bobbin of thread *h*, Fig. 7. This shuttle is driven by an oscillating driver *db* within an annular raceway *a a*, and, instead of revolving completely like the Wilson hook, it only oscillates in an arc of 150°, so far as serves to catch and clear the upper thread. The oscillating-shuttle and rotary hook machines work with great smoothness and rapidity.

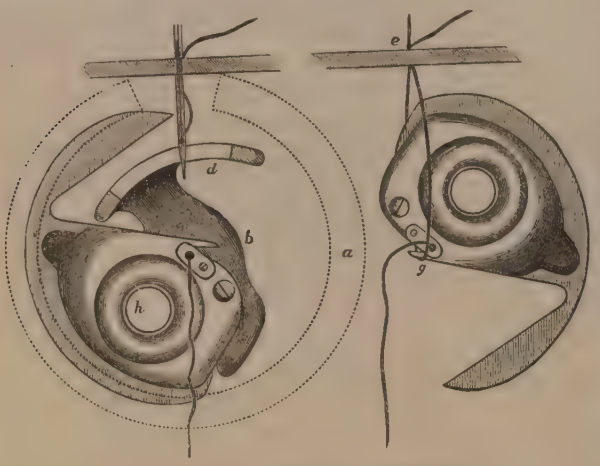

FIG. 7.—Singer's Oscillating-Shuttle Machine.

There are numerous special sewing-machines adapted for leather work, glove-sewing, etc., some of which will be alluded to under SHOES. (J. PA.)

SEX. Since the article REPRODUCTION (*q.v.*) includes not only some account of the reproductive processes but an outline of the comparative anatomy of the reproductive organs, and even a somewhat detailed description of the essential sexual elements, it only remains here to make a brief survey of the more important groups with respect to the absence, union, or distinction of the sexes and to the associated "secondary sexual characters" which distinctly male and female organisms so frequently and strikingly present, and to follow up that outline of the morphological facts with a brief discussion of the nature and origin of the sexes and of the theory of reproduction.

Characters of the Sexes.—Starting with the *Protozoa*, we find indeed that union or conjugation of two or more individuals is of frequent if not universal occurrence; yet, since, at any rate with rare and slight exceptions, no permanent morphological difference can be made out which would entitle us to speak of males or females, the group is generally defined as characterized by the absence of sexual reproduction. Without at present accepting or rejecting this view, it is convenient to postpone its discussion until the origin of sex comes to be considered.

Passing to the *Cœlentera*, we find among the *Hydromedusæ* the sexes usually distinct, and this distinction of the sexes has lately been traced back to the apparently asexual colonies from which the gonophores arise. Exceptions, however, occur,— *e.g.*, *Tubularia*, which is monœcious. The higher *Medusæ* are also usually unisexual, and occasionally even show secondary sexual differences, as in the form and length of the prehensile filaments (*Aurelia*). *Chrysaora*, however, is hermaphrodite. The *Siphonophora* usually present both sexes within a single colony,—the gonophores themselves being, however, unisexual. In a few cases (*Apolemia uvaria*, *Diphyes acuminata*) the colony itself is entirely male or female. The *Ctenophora* are invariably hermaphrodite; and among the *Hexactinia* this is frequently though not generally the case, completely dicœcious-colonies even occurring (*Gerardia*). Among the *Octactinia* the sexes are usually distinct, even so far as the colonies are concerned, yet there are many exceptions, *e.g.*, *Corallium*, which has male, female, and hermaphrodite polyps on the same stock. See HYDROZOA, CORALS, etc.

The *Echinodermata* are very rarely hermaphrodite (*Synapta, Amphiura squamata*), but secondary sexual characters are almost unknown. *Thyone*, however, has the male orifice on a small protuberance. See ECHINODERMATA.

Probably no invertebrate group presents so varied and interesting a series of sexual phenomena as the *Vermes*. Thus the *Polyzoa* exhibit that remarkable association of hermaphroditism with asexual reproduction which so frequently recurs in organisms of vegetative habit. The Brachiopods also are hermaphrodite, as also are the Oligochætes; *Polychæta* only exceptionally so; some (*Nereidæ*) exhibit secondary sexual characters so well marked as to have been mistaken for specific or even generic ones. The *Platyhelminthes* with few exceptions are hermaphrodite; the Nemerteans (except *Borlasia*) are unisexual and occasionally exhibit secondary sexual differences. The Nematodes are very rarely hermaphrodite (*Ascaris, Pelodytes*), but present very marked sexual differences, the male being usually recognizable by smaller size and caudal curvature. Spicules or claspers for copulation are also present. In *Strongylus* the female is carried by the male in a ventral furrow. The aberrant nematoid *Echinorhynchus* is also dicœcious. *Sagitta* is hermaphrodite; *Balanoglossus* unisexual, but without secondary sexual difference. Some of the most striking cases of sexual dimorphism are presented by the *Rotifera*, where the male is often a fallen representative of the specific type presented by the female, having not only greatly diminished in size but having undergone thorough degeneration in structure, the alimentary canal especially becoming represented by a mere imperforate thread of cells. Nor are such cases of male degeneration by any means confined to this group: a yet more striking instance is presented by the Gephyrean *Bonellia*, in which the oviduct of the large and well-grown female contains a number of almost microscopic ciliated Turbellarian-looking parasites, which have been shown to be the degenerate males. The other *Gephyrea* present no such extraordinary dimorphism, while the *Discophora* are hermaphrodite. See POLYZOA, BRACHIOPODA, ANNELIDA, NEMERTEANS, PLANARIANS, TAPEWORM, SAGITTA, LEECH, etc.

Among Crustaceans the males are frequently smaller or relatively dwarfish, sometimes attached parasitically to the female, and the sexes are generally distinguishable at least by differences in the structure of some of the appendages, —generally, however, in evident relation to their respective functions. Among the Copepods the sexes are separate, and a marked tendency to dimorphism is manifested, even among the free-living forms. This is sometimes manifested in a way which suggests the sexual magnificence of the highest animals; thus, for instance, the male *Sapphirina* has the brilliance of a gem. With the appearance of parasitism in the group the reproductive relations become profoundly modified; thus it is the always less active female which first becomes sessile and parasitic; the male occasionally permanently retains freedom, as in the common *Nicothoe* of the lobster's gill; more usually, however, he settles down beside or even upon the female and becomes more or less completely epi-parasitic, undergoing a more thorough degeneration than the female herself. The analogous series from free to parasitic forms furnished by the *Ostracoda* and *Cirripedia* are yet more remarkable in their sexual degeneration, since not only does hermaphroditism become the rule, but "complementary males" (most frequently two to one female) appear. These are utterly degenerate in size and structure, in fact often quite unrecognizable as Cirripedes at all, much less as members of the same species, save for their developmental history and the existence of a few intermediate degrees of degeneration between the normal and the lost Cirripede organization,—*e.g.*, *Ibla* or *Scalpellum*, where the males of some species still retain cirri and buccal pieces. In some cases at least their male reproductive function seems to be discharged early in larval life, before the exchange of free for sessile habits, their subsequent life apparently even sinking below the level of reproductive activity. A reversal of sex has actually been alleged in some cases, the males having been said to become female. In the Phyllopods the sexes are separate, but parthenogenesis very frequently occurs, as in *Daphnia*,

Apus, etc., and even in *Apus* tends to replace sexual reproduction very completely. Von Siebold examined thousands of specimens during twelve years without finding a single male; in other years, however, from 10 to 45 per cent. of males have since been found. Besides the usual copulatory modifications of appendages the males of some Phyllopods have more olfactory filaments on the antennæ. In Amphipods similar differences have been noted; in Isopods these often become much more marked,—sometimes, as in the classical case of *Praniza* and *Anceus*, reaching a degree of dimorphism without degeneration which is hardly exceeded in the animal kingdom, and which quite naturally led to the separation of the sexes into distinct genera. In the parasitic forms (*Bopyridæ*) the females degenerate much more thoroughly than the small and active males. The Schizopods exhibit considerable sexual differences. Thus among the males the antennæ bear larger olfactory comb-like structures and larger abdominal members; copulatory appendages may also be specialized; while the females, as in many Isopods, etc., have a brood-pouch formed of overlapping ventral lamellæ. The different position of the sex-openings and the characteristic forms of the limbs render the sexes easily distinguishable among the Decapods; the crabs have an obviously broader abdomen in the female (see CRUSTACEA). Among the *Arachnida*, the archaic king-crabs already show slight external sex-differences; among the spiders the males have a maxillary palp specially modified for a copulatory organ, an adaptation which, associated with their often extremely small size, is of great importance in aiding their escape from their larger and ferocious mates. Some species of *Theridium* have a stridulating apparatus. The male scorpions on the other hand seem to possess a rather stronger development; in the *Acarinæ* the smaller males are more distinctly segmented, possess appendages modified for attachment, and sometimes retain a free habit of life as distinguished from the parasitic females. See ARACHNIDA.

Among Insects the sexes are distinguished by varying modifications of different parts of the body, and differences in general form and in color are frequent. The males are generally active and more beautiful, and seem better endowed with sense organs, though usually smaller than the females. The males have also a preëminence or even monopoly in producing sounds, and it is perhaps in relation to this that the psychology of sex can first be said to come within the range of observation. Thus the field-cricket is said to lower the tone of his song while caressing the female with his antennæ. In the parasitic forms dimorphism, as might be expected, becomes very marked; in *Strepsiptera* the males are free and winged, while the females are blind and wingless, in fact, permanently larval. Similar cases occur in other orders, the glow-worm being probably the most familiar instance. In parasitic or abundantly nourished forms parthenogenesis very frequently appears, the extreme case being presented by *Cecidomyia*, a fly which exhibits rapid parthenogenetic reproduction in the larval state. The dimorphism of many beetles, in which the male frequently acquires the most extraordinary specializations of external form, has received especial attention from Darwin, whose *Descent of Man* includes the fullest details. Here it is enough to mention that Reichenau has recently pointed out the coexistence of the larger size and relative inactivity of the male with the presence of these functionless outgrowths. The beautiful sexual dimorphism so common among the Lepidoptera need not be more than mentioned at present; while the very remarkable sexual differentiation of *Hymenoptera* (bees, ants, sawflies, etc.) may also be assumed to be sufficiently familiar. (See INSECTS, ANTS, BEES.) In several orders (*Diptera*, *Lepidoptera*, *Coleoptera*) cases of dimorphism occur among the females themselves, or even among the males; as many as three forms of females have been described in certain butterflies.

The Molluscan series opens with the normally dicœcious Lamellibranchs, of which some genera (most species of *Ostrea*, *Pecten*, etc.) are, however, hermaphrodite. The Pteropods, Polmonates, and Opisthobranchs are hermaphrodite; the Prosobranchs, Heteropods, and Cephalopods unisexual. Though slight differences have been described even in Lamellibranch shells (*Unio*), and though the internal anatomy of the essential and accessory organs is of very high complexity, the extraordinary phenomena associated with "hectocotylization" among the Cephalopods are the only marked outward manifestations of that sexual dimorphism which reaches its climax in the Argonaut. (See MOLLUSCA, CUTTLE-FISH.) The Tunicates are usually hermaphrodite; *Amphioxus*, however, is unisexual (see TUNICATA).

Among Fishes hermaphroditism is extremely rare (*Serranus*). The males are sometimes characterized by the modification of the pelvic limbs as claspers, etc., and are at the reproductive period often readily distinguishable from the females by their brighter color or other cutaneous changes, such as ruffling of the skin. Male and female rays are readily also distinguishable by their teeth and dermal defences. The hooked jaw of the male salmon gives him a characteristic physiognomy during the breeding season. The carp undergoes a sort of epidermic eruption at the same period; male and female eels, too, are said often to become distinguishable both in color and shape. Stridulating apparatus may be present, notably in the Siluroids. (See ICHTHYOLOGY.) Among Amphibians the bright dorsal crest of the male newt is perhaps the most striking of sex distinctions, but many male frogs and toads have vocal air sacs, epidermal callosities, and some (*Cultripes*, *Pelobates*) possess a gland under the fore-limb. (See AMPHIBIA.)

Among the Ophidians the males are smaller, and have longer and more slender tails; the sexes, too, differ sometimes in color and markings. Male Chelonians, too, have sometimes longer tails and claws and may even give voice. The submaxillary musk-gland of the crocodile is especially active in the breeding season; the lizards have remarkable throat-pouches and crests, which may be epidermic or even correspond to cranial outgrowths, as in the chameleon.

But it is among Birds and Mammals that the observer of sexual characters finds abundant and remarkable differences extending to the minutest details, and showing how the higher evolution of parental care which the inevitably prolonged embryonic life involves and the wider range of sexual selection have coöperated in modifying the whole organism. As might be expected, the lower mammals show least of this; but as we ascend the adult males become differentiated from the females by the acquirement of secondary sexual characters which are mainly either offensive and defensive aids for battle with each other, or which assist in gaining the admiration of the females; and these may coexist or coincide in very various degrees. Thus scent-glands are of common occurrence from the *Insectivora* (perhaps even from *Ornithorhynchus*) upwards. Greater beauty of markings or more vivid colors are acquired,—in many *Anthropidæ* (baboons, etc.) the latter being of peculiarly crude magnificence. Abundant local growths of hair often appear, most notably in the lion and in many *Anthropidæ*. The development of tusks and horns is also too familiar to need more than passing mention.

But it is unquestionable that in this as in not a few other respects the birds, rather than the mammals, have reached the highest stages of evolution. For here sexual characters no longer seem merely superadded or supplementary to the apparatus of individual life, but habits and organization alike become thoroughly adapted to these—the sex-differences and the reproductive functions as it were saturating the whole life, and producing so many and marvellous results, in habits and character, in beauty and song, that it is not to be wondered at that the descriptive labors of the professed ornithologist have constantly risen into those of the artist and even the poet. See BIRDS, and Darwin's *Descent of Man*.

Nature and Determination of Sex.—It is not here proposed to enter upon the task of historical review and criticism of the various theories of sex—which were estimated at so many as five hundred at the beginning of the last century, or even to attempt any sketch of the present very conflicting state of opinion on the subject.[1]

Although our theories of sex may be still vague enough, the greatest step to the solution has been made in the general abandonment by scientific men of the doubtless still popular explanation—in terms of a "natural tendency" for the production of an excess of males or the like. It is now held that "quality and quantity of food, elevation of abode, conditions of temperature, relative age of parents, their mode of life, habits, rank, etc., are all factors which have to be considered." The idea that the problem of the nature of sex is capable of being approached by empirical observation of the numbers of different sexes produced under known sets of conditions, and the obvious practical corollary of this, viz., that the proportion of the

[1] As for reproduction in general, so for sex, the most convenient starting-point is the work of Heusen ("Die Zeugung," in Hermann's *Hdb. d. Physiologie*), while other dissertations are to be found in the leading manuals of zoology and botany, especially, however, in special papers too numerous to mention. See also REPRODUCTION, and for fuller bibliographical details see Geddes, "On the Theory of Growth, Reproduction, Sex, and Heredity," *Proc. Roy. Soc. Edin.*, 1886.

sexes must therefore be capable of being experimentally modified and regulated, are conceptions which have steadily been acquiring prominence, especially of late. In short, if we can find how sex is determined, we shall have gone far to investigate sex itself.

One of the most crude attempts has been that of Canestrini, who ascribes the determination of sex to the number of sperms entering the ovum, but this view has been already demolished by Fol and Pflüger. The time of fertilization has also and apparently with greater weight been insisted upon; thus Thury, followed by Düsing, holds that the sex of the offspring depends on the period of fertilization: an ovum fertilized soon after liberation produces a female, while the fertilization of an older ovum produces a male. This view has been carried a step farther by Hensen, who suggests that the same should probably hold true of the spermatozoa, and thus the fertilization of a young ovum by a fresh sperm would have a double likelihood of resulting in a female. There are some observations which support this: thus, Thury and other cattle-breeders have claimed to determine the sex of cattle on this principle, and Girou long ago alleged that female flowers, fertilized as soon as they are able to receive pollen, produced a distinct excess of female offspring.

Great weight has also been laid on the relative age of the parents. Thus Hofacker, so long ago as 1828, and Sadler a couple of years later, independently published a body of statistics (each of about 2000 births) in favor of the generalization (since known as Hofacker's and Sadler's law) that when the male parent is the elder the offspring are preponderatingly male: while, if the parents be of the same age, or *a fortiori* if the male parent be younger, female offspring appear in increasing majority. This view has been confirmed by Goehlert, Boulanger, Legoyt, and others; some breeders of horses, cattle, and pigeons have also accepted it. Other breeders, however, deny it altogether; moreover, the recent statistics of Stieda and of Berner (taken independently from Alsace-Lorraine and Scandinavia) seem to stand in irreconcilable contradiction. At any rate at present we do not seem justified in ascribing greater importance to the relative age of parents than as a secondary factor, which may probably take its place among those causes influencing nourishment discussed below.

That good nourishment appears to produce a distinct preponderance of females is perhaps the single result which can at present be regarded as clearly proven and generally accepted. Yet it would be too much to say that unanimity is even here complete; thus, among plants, the experiments of Girou (1823), Haberlandt (1869), and others gave no certain result; those of Heyer (1883) have led him to dispute the validity of the generalization altogether, while Haberlandt (1877) brought evidence for regarding the excess of females as largely due to the greater mortality of the males. The investigations of agricultural observers, especially Meehan (1878), which are essentially corroborated by Düsing (1883), however, leave little doubt that abundant moisture and nourishment tend to produce females. Some of Meehan's points are extremely instructive. Thus old branches of Conifers overgrown and shaded by younger ones produce only male inflorescences, a fact which may be taken in connection with Sadebeck's observation that some fern prothallia, under unfavorable conditions, can still form antheridia but not archegonia. The formation of female flowers on male heads of maize is ascribed by Knop to better nutrition consequent on abundant moisture. The only seriously contradictory observations are thus those of Heyer, and it is therefore reassuring when a detailed scrutiny of his paper shows his ill-conducted experiments (which land him in the conclusion that the organism is not modifiable by its environment at all) to be largely capable of a reversed interpretation. The agency of temperature is also of considerable importance. Thus Meehan finds that the male plants of hazel grow more actively in heat than the female, and Ascherson states that *Stratiotes aloides* bears only female flowers north of 52° lat., and from 50° southwards only male ones. Other instances might be given.

Passing to the animal kingdom we find the cases of insects peculiarly clear; thus Mrs. Treat showed that if caterpillars were starved before entering the chrysalis state the resultant butterflies or moths were males, while others of the same brood highly nourished came out females. Gentry too has shown for moths that innutritious or diseased food produced males; hence perhaps a partial explanation of the excess of male insects in autumn, although temperature is probably more important. The recent experiments of Yung on tadpoles are also very conclusive. Thus he raised the percentage of females in one brood from 56 in those unfed to 78 in those fed with beef, and in another supply from 61 to 81 per cent. by feeding with fish; while, when the especially nutritious flesh of frogs was supplied, the percentage rose from 54 to 92. Among mammals the difficulties of proof are greater, but evidence is by no means wanting. Thus an important experiment was long ago made by Girou, who divided a flock of 300 ewes into equal parts, of which the one half were extremely well fed and served by two young rams, while the other was served by two mature rams and poorly fed. The proportion of ewe lambs in the two cases was respectively 60 and 40 per cent. Düsing also states that it is usually the heavier ewes which bring forth ewe lambs.

Nor does sex in the human species appear to be independent of differences of nutrition. After a cholera epidemic or a war more boys are said to be born, and Düsing also points out that in females with small placenta and little menstruation more boys are found, and even affirms that the number of male children varies with the rise in prices. In towns and in prosperous families there are also more females, while males are more numerous in the country and among the poor. The influence of temperature is also marked: more males are born during the colder months, a fact noted also by Schlechter for horses.

The best known and probably still most influential theory is that systematized by Girou and known as that of "comparative vigor." This makes sex of offspring depend on that of the more vigorous parent. But to this view there are serious difficulties; thus consumptive mothers produce a great excess of daughters, not sons as might be expected from the superior health of the father. Still less weight can be attached to that form of the hypothesis which would make sex follow "genital superiority" or "relative ardency" alone. Any new theory has thus to reconcile the arguments in favor of each of the preceding views,—and meet the difficulties which beset all. As Starkweather puts it, it must at once account for such facts as "the preponderance of male births in Europe, of females among mulattoes and other hybrid races, as also among polygamous animals, and for the equality among other animals. More especially it must suggest some principle of self-adjustment by which not only is the balance of the sexes nearly preserved on the whole, but by which also in cases of special disturbance the balance tends to readjust itself." Starkweather proceeds to attempt this, and his argument may be briefly summarized. While few maintain any essential equality of the sexes, and still fewer any superiority of the female, the weight of authority has been from the earliest times in favor of the doctrine of male superiority. From the earliest ages philosophers have contended that woman is but an undeveloped man; Darwin's theory of sexual selection presupposes a superiority in the male line and entailed on that sex; for Spencer the development of woman is early arrested by procreative functions; in short, Darwin's man is as it were an evolved woman, and Spencer's woman an arrested man. On such grounds we have a number

of theories of sex. Hough thinks males are born when the system is at its best, more females when occupied in growth, reparation, or disease. So, too, Tiedman and others regard every embryo as originally female and remaining female if arrested, while Velpau conversely regards embryos as all naturally male, but frequently degenerating to the female state. Starkweather points out some of the difficulties to the view of female inferiority, and lays it down as the foundation of his work that "neither sex is physically the superior, but both are essentially equal in a physiological sense." But while this is true of the average, there are many grades of individual differences and deficiencies in detail, involving a greater or less degree of superiority in one or other of every pair. Starkweather's theory then is "that sex is determined by the superior parent, also that the superior parent produces the opposite sex." The arguments adduced in favor of this view, however, are scarcely worthy of it, since, save a chapter of pseudo-physiological discussion of vital forces and polarities, of superiority,—nervous, electrical, etc.,—they rest mainly on the vague and shifting grounds of physiognomy and temperament. And when superiority is analyzed into its factors,—cerebral development and activity, temperament, state of health, of nutrition, etc.,—soon we find under the appearance of simplicity a law has been obtained not by discovering any real unity under the many apparently different factors, but by simply lumping them under a common name. Nor is a rationale given of the affirmed reversal of sex, which Schlechter and other authorities moreover wholly deny. Despite these and other faults and failures the work is interesting and often suggestive, and that not only on account of its theoretic position but its sanguine proposals for the practical control of sex.

The work of Düsing (1883), while less speculative, is of great importance in respect to the causes which regulate the proportions of the sexes; since, instead of falling back with Darwin on the unexplained operation of natural selection, he seeks to note the circumstances in which a majority of one sex is profitable, and to show that organisms have really the power to produce in such circumstances a majority of one sex,—in short, that disturbances in the proportion of the sexes bring about their own compensation, and further supports these views by calculation and statistical evidence.

He separates the causes determining sex into those affecting (*a*) one parent and (*b*) both alike. Starting with a minority of one sex, he emphasizes the importance of delayed fertilization, accepting it as a fact that females late fertilized bear most males (this corresponding in man to a scarcity of males among the lower animals). He notes that the first-born child is most frequently a male, especially among older persons, and thus explains how after a war, when there is a want of males, most male children are born. He ascribes importance to the amount of sexual intercourse. Thus, suppose a minority of females: their fertilization tends to occur more frequently, and thus (if the general statement be correct) they should produce a majority of their own sex; or similarly with males. This is supported by reference to cattle-breeding, and it is interpreted physiologically to involve that young spermatozoa produce a majority of males. Suppose a great majority of males: the chances of early fertilization of the females are of course great, but eggs fertilized early tend to produce females. Or suppose conversely a great minority of males: the chances of early fertilization are small, but old eggs tend to produce males, and either excess will thus become compensated. Or again, the more decided the minority of one sex the more frequent the sexual activity of its individuals, the younger their sexual elements, and consequently the more individuals of that sex are produced. Düsing next takes up as indirect causes equivalent to a minority of individuals—(*a*) deficient nutrition; just as frequent copulation overstrains the genital organs the same result may arise from the deficient nutrition of the system; hence an ill-fed cow yields a female to a well-fed bull and *vice versa*; (*b*) relative age; the nearer either parent is to the period of greatest reproductive capacity the less, he thinks, is a birth of that sex probable.

As factors affecting both parents he first discusses variations in nutrition; although means of subsistence may decrease, there is at first no decrease in the number of progeny. But it is necessary to distinguish the reproduction of the species from its multiplication, so that in defective nutrition, though an animal may not reproduce less, it will permanently multiply much less. He agrees with Darwin that the reproductive system is most sensitive to changes of nutrition; gives cases showing the effect of abundant nutrition on reproductive activity, notes the influence of climate, function, etc., and contrasts organisms of high activity, like birds and insects, with parasites. The nutritive relations of the sexes are also contrasted; since females have to give to the embryo more than the male, they are much more dependent on food for vigor of their reproductive capacity, and hence the frequent contrast of their size, etc. Furthermore, animals suit their multiplication to their conditions of nutrition; if food be abundant there is an increase in the number of females, and therefore a further increase in number of individuals of the species; if food, however, be too scarce the more males are produced and the number of the species tends to diminish. Hence the connection above mentioned between increase of children (especially females) in prosperity and after a good harvest, and the rising proportion of boys during a rise of prices. Similarly for animals: the more food the more females, and the more rapidly the species increases; the less food the more males, and the less rapid the increase. Again, plants on good soil produce more female flowers and more seed with profit to the species; on bad soil male flowers preponderate, mostly perish, and the species tends to disappear. The extreme case of optimum nutrition tends to produce normal parthenogenesis ("thelytokie"), yielding only females, different in cause and operation from the parthenogenesis resulting from the absence of males ("arrenotokie").[1]

Theory of Reproduction and Sex.—If we now attempt to reach a rational standpoint from which to criticise and compare the innumerable empirical conceptions of sex,—much more if we seek a firm basis for the construction of a really comprehensive theory,—it is evident that such a theory must be addressed not merely to the specialist concerned with problems of reproduction and development, but, while embracing details and anomalies, must be satisfactory alike to the general morphologist and physiologist. We must, therefore, have before us that conception of the main lines of thought on each of these subjects which has been outlined under the headings PHYSIOLOGY and MORPHOLOGY.

The close coincidence between these two independent developments is especially to be noted. From the vague account of general form and appearance, of habits and temperaments, which made up the descriptive natural history of the past, the two streams of progress, though distinct, are wholly parallel. Thus Buffon furnished a brilliant and synthetic exposition of the oldest view, while one side of their general aspect received new precision at the hands of Linnæus,—to some extent the other also at the hands of his physiological contemporaries. The anatomical advance of Cuvier is parallel to the detailed study of the functions of the organs, while the great step made by Bichat lay in piercing below the conception of the organ and its function as ultimate, and in seeking to interpret both by reference to the component tissues. The cell-theory of Schwann and his successors analyzed these tissues a step farther, while the latest and deepest analysis refers all structure ultimately to the substance called protoplasm, and similarly claims to express all function in terms of the construction and destruction, synthesis and analysis, anabolism and katabolism of this. See PHYSIOLOGY, PROTOPLASM, MORPHOLOGY.

Now, since every morphological and physiological fact or theory is in one or other of these few categories, it is evident that we have here the required criterion of theories of reproduction and sex. The question, What is sex? what is meant by male or female? admits of a regular series of answers. The first and earliest is in terms of general aspect, temperament, and habit, and, though crude, empirical, and superfi-

[1] See Düsing, *Jena Zeitschr.*, 1885; Starkweather, *Law of Sex*, 1883.

cial, it lacks neither unity nor usefulness. At this plane are not only most popular conceptions but many theories like that of Starkweather, which may be mentioned as the most recent. The anatomist contents himself with the recognition of specific organs of sex, or at most with a similarly empirical account of their functions; while the embryologist and histologist will not rest contented without seeking to refer these organs to the tissues of which they are composed and the layer from which they spring, and even reaches and describes the ultimate cellular elements essential to sex,—the ovum and spermatozoon. A parallel physiological interpretation of these is next required, and at this point appear such hypotheses as these of Weismann and others.

Thus the bewildering superabundance of widely different theories at the present juncture becomes intelligible enough; and, each once classified according to its stage of progress, a detailed criticism would be easy. But this is not enough; the demand for an explanation at once rational and ultimate, to comprehend and underlie all the preceding ones, is only the more urgent. Where shall we seek for it? On the one hand the morphological aspect of such an explanation must interpret the forms of sex cells in terms of those of cells in general, and in terms of the structural properties of protoplasm itself; while its more difficult yet more satisfying physiological aspect must express the mysterious difference of male and female in terms of the life processes of that protoplasm,—in terms, that is to say, of anabolism and katabolism. Were these steps made a new synthesis would be reached, and from this point it should even next be possible to retrace the progress of the science, and interpret the forms and the functions of tissues and organs, nay, even of the facts of aspect, habit, and temperament, so furnishing the deductive rationale of each hitherto merely empirical order of observed fact and connecting theory.

While this conception does not admit of development within the present limits,[1] a brief abstract of such an interpretation of reproduction and of sex in terms of anabolism and katabolism may be of interest to the reader. The theory of reproduction, in general principle at least, is simple enough. A continued surplus of anabolism involves growth, and the setting in of reproduction when growth stops implies a relative katabolism. This in short is merely a more precise restatement of the familiar antithesis between nutrition and reproduction. At first this disintegration and reintegration entirely exhaust the organism and conclude its individual existence, but as we ascend the process becomes a more localized one. The origin of this localization of the reproductive functions may best be understood if we figure to ourselves a fragment of the genealogical tree of the evolutionist in greater detail, and bear in mind that this is made up of a continuous alternate series of sex-cell and organism, the organism too, becoming less and less distinguished from its parent cell until the two practically coincide in the *Protozoa*, which should be defined not so much as "organisms devoid of sexual reproduction" but rather as undifferentiated reproductive cells (protosperms or protova, as they might in fact be called), which have not built up round themselves a body. We should note, too, how the continuous immortal stream of Protozoan life (see PROTOZOA) is continued by that of ordinary reproductive cells among the higher animals, for the mortality of these does not affect this continuity any more than the fall of leaves does the continued life of the tree. The interpretation of sex is thus less difficult than might at first sight appear. For anabolism and katabolism cannot and do not absolutely balance, as all the facts of rest and motion, nutrition and reproduction, variation and disease, in short of life and death, clearly show. During life neither process can completely stop, but their algebraic sum keeps varying within the widest limits. Let us note the result, starting from the undifferentiated amœboid cell. A surplus of anabolism over katabolism involves not only a growth in size but a reduction in kinetic and a gain in potential energy, *i.e.*, a diminution of movement. Irregularities thus tend to disappear; surface tension too may aid; and the cell acquires a spheroidal form. The large and quiescent ovum is thus intelligible enough. Again starting from the amœboid cell, if katabolism be in increasing preponderance the increasing liberation of kinetic energy thus implied must find its outward expression in increased activity of movement and in diminished size; the more active cell becomes modified in form by passage through its fluid environment, and the flagellate form of the spermatozoon is thus natural enough. It is noteworthy, too, that these physiological normal results of the rhythm of cellular life, the resting, amœboid, and ciliate forms, are precisely those which we empirically reach on morphological grounds alone (see MORPHOLOGY, vol. xvi. p. 869).

Given, then, the conception of the cellular life rhythm as capable of thus passing into a distinctly anabolic or katabolic habit or diathesis, the explanation of the phenomena of reproduction becomes only a special field within a more general view of structure and function, nay even of variation, normal and pathological. Thus the generality, use, and nature of the process of fertilization becomes readily intelligible. The profound chemical difference surmised by so many authors becomes intelligible as the outcome of anabolism and katabolism respectively, and the union of their products as restoring the normal balance and rhythm of the renewed cellular life. Without discussing the details of this, farther than to note how it resumes the speculations of Rolph and others as to the origin of fertilization from mutual digestion, of the reproductive from the nutritive function, we may note how they illustrate on this view that origin of fertilization from conjugation which is the central problem of the ontogeny and phylogeny of sex. The formation of polar vesicles seems thus an extrusion of katabolic (or male) elements, and conversely its analogues in spermatogenesis (see REPRODUCTION). Passing over such tempting applications as that to the explanation of segmentation and even subsequent developmental changes, it must suffice to note that the constant insistance of embryologists upon the physiological importance of the embryonic layers bears essentially upon their respective predominance of anabolism and katabolism. The passage from ordinary growth to that discontinuous growth which we term asexual reproduction, and from this again to sexuality or the frequent reverse progress, is capable of rational interpretation in like manner: the "alternation of generations" is but a rhythm between a relatively anabolic and katabolic preponderance; a parthenogenetic ovum is an incompletely differentiated ovum which retains a measure of katabolic (male) products, and thus does not need fertilization; while hermaphroditism is due to the local preponderances of anabolism or katabolism in one set of reproductive cells or in one period of their life. The reversion of unisexual forms to hermaphrodite ones, or of these to asexual ones, which we have seen in such constant association with high nutrition and low expenditure,[2] is no longer inexplicable. The female sex being thus preponderatingly anabolic, the importance of good nutrition in determining it is explained: menstruation is seen to be the means of getting rid of the anabolic surplus in absence of its fœtal consumption, while the higher temperature and greater activities of the male sex express its katabolic diathesis. The phenomena of sex, then, are no isolated ones, but express the highest outcome of the whole activities of the organism—the literal blossoming of the individual life. (P. GE.)

[1] See paper by Geddes already mentioned at p. 724, footnote.

SEXTANT, an instrument for measuring angles on the celestial sphere. The name (indicating that the instrument is furnished with a graduated arc equal to a sixth part of a circle) is now only used to designate an instrument employing reflection to measure an angle; but originally it was introduced by Tycho Brahe, who constructed several sextants with two sights, one on a fixed, the other on a movable radius, which the observer pointed to the two objects of which the angular distance was to be measured.

In the article NAVIGATION the instruments are described which were in use before the invention of the reflecting sextant. Their imperfections were so evident that the idea of employing reflection to remove them occurred independently to several minds. Hooke contrived two reflecting instruments. The first is described in his *Posthumous Works* (p. 503); it had only one mirror, which reflected the light from one object into a telescope which is pointed directly at the other. Hooke's second plan employed two single reflections, whereby an eye placed at the side

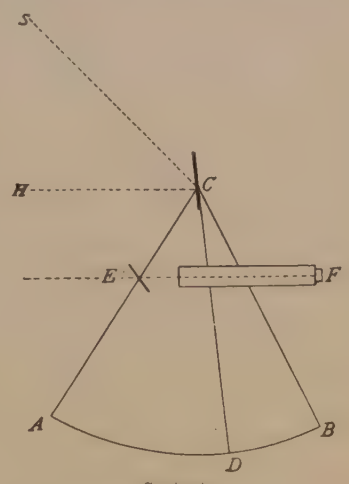
[2] Thus Marshall Ward has lately drawn attention to the association of parasitism with the disappearance of sexual reproduction in *Fungi* (*Quart. Jour. Micr. Sci.*, xxiv.).

of a quadrant could at the same time see the images formed in two telescopes, the axes of which were radii of the quadrant and which were pointed at the two objects to be measured. This plan is described in Hooke's *Animadversions to the Machina Cœlestis of Hevelius*, published in 1674, while the first one seems to have been communicated to the Royal Society in 1666. Newton had also his attention turned to this subject, but nothing was known about his ideas till 1742, when a description in his own handwriting of an instrument devised by him was found among Halley's papers and printed in the *Philosophical Transactions* (No. 465). It consists of a sector of brass, the arc of which, though only equal to one-eighth part of a circle, is divided into 90°. A telescope is fixed along a radius of the sector, the object glass being close to the centre and having outside it a plane mirror inclined 45° to the axis of the telescope, and intercepting half the light which would otherwise fall on the object glass. One object is seen through the telescope, while a movable radius, carrying a second mirror close to the first, is turned round the centre until the second object by double reflection is seen in the telescope to coincide with the first.

But long before this plan of Newton's saw the light the sextant in its present form had been invented and had come into practical use. On May 13, 1731, John Hadley gave an account of an "octant," employing double reflection, and a fortnight later he exhibited the instrument.[1] On the 20th May Halley stated to the society that Newton had invented an instrument founded on the same principle, and had communicated an account of it to the society in 1699, but on search being made in the minutes it was only found that Newton had showed a new instrument "for observing the moon and stars for the longitude at sea, being the old instrument mended of some faults," but nothing whatever was found in the minutes concerning the principle of the construction. Halley had evidently only a very dim recollection of Newton's plan, and at a meeting of the Royal Society on December 16, 1731, he declared himself satisfied that Hadley's idea was quite different from Newton's. The new instrument was already in August, 1732, tried on board the "Chatham" yacht by order of the Admiralty, and was found satisfactory, but otherwise it does not seem to have superseded the older instruments for at least twenty years. As constructed by Hadley the instrument could only measure angles up to 90°; but in 1757 Captain Campbell of the navy, one of the first to use it assiduously, proposed to enlarge it so as to measure angles up to 120°, in which form it is now generally employed.

Quite independently of Hadley and Newton the sextant was invented by Thomas Godfrey, a poor glazier in Philadelphia. In May, 1732, Mr. James Logan of that city wrote to Halley that Godfrey had about eighteen months previously showed him a common sea quadrant "to which he had fitted two pieces of looking-glass in such a manner as brought two stars at almost any distance to coincide." The letter gave a full description of the instrument; the principle was the same as that of Hadley's first octant which had the telescope along a radius. At the meeting of the Royal Society on January 31, 1734, two affidavits sworn before the mayor of Philadelphia were read, proving that Godfrey's quadrant was made about November, 1730, that on the 28th November it was brought by G. Stewart, mate, on board a sloop, the "Truman," John Cox, master, bound for Jamaica, and that in August, 1731, it was used by the same persons on a voyage to Newfoundland. There can thus be no doubt that Godfrey invented the instrument independently; but the statement of several modern writers that a brother of Godfrey, a captain in the West India trade, sold the quadrant at Jamaica to a Captain or Lieutenant Hadley of the British navy, who brought it to London to his brother, an instrument maker in the Strand, has been proved to be devoid of all foundation. Not only is this totally at variance with all the particulars given in the affidavits, but between 1719 and 1743 there was no officer in the British navy of the name of Hadley, and John Hadley cannot possibly have been in the West Indies at that time, as he was present at many meetings of the Royal Society between November, 1730, and May, 1731; besides, neither Hadley nor his brothers were professional instrument makers. A detailed discussion of this question by Prof. Rigaud is found in the *Nautical Magazine*, vol. ii. No. 21.[2]

The annexed figure gives an idea of the construction of the sextant. ABC is a light framework of brass in the shape of a sector of 60°, the limb AB having a graduated arc of silver (sometimes of gold) inlaid in the brass. It is held in the hand by a small handle at the back, either vertically to measure the altitude of an object, or in the plane passing through two objects the angular distance of which is to be found. CD is a radius movable round C, where a small plane mirror of silvered plate-glass is fixed perpendicular to the plane of the sextant and in the line CD. At D is a vernier read through a small lens, also a clamp and a tangent screw which enable the observer to give the arm CD a very slow motion within certain limits. At E is another mirror "the horizon glass," also perpendicular to the plane of the sextant and parallel to CB. F is a small telescope fixed across CB, parallel to the plane CAB and pointed to the mirror E. Dark glasses can be placed outside E and between E and C when observing the sun. As only the lower half of E is silvered, the observer can see the horizon in the telescope through the unsilvered half, while the light from the sun or a star S may be reflected from the "index glass" C to the silvered half of E and thence through F to the observer's eye. If CD has been moved so as to make the image of a star or of the limb of the sun coincide with that of the horizon, it is easy to see that the angle SCH (the altitude of the star or solar limb) is equal to twice the angle BCD. The limb AB is always graduated so as to avoid the necessity of doubling the measured angle, a space marked as a degree on the limb being in reality only 30′. The vernier should point to 0° 0′ 0″ when the two mirrors are parallel, or in other words, when the direct and reflected images of a very distant object are seen to coincide. For the methods of adjusting the mirrors and finding the index error see NAVIGATION (vol. xvii. p. 275).



Sextant.

If the sextant is employed on land, an artifical horizon has to be used. This is generally a basin of mercury pro-

[1] Hadley described two different constructions: in one the telescope was fixed along a radius as in Newton's form, in the other it was placed in the way afterwards universally adopted; an octant of the first construction was made as early as the summer of 1730, according to a statement made to the Royal Society by Hadley's brother George on February 7, 1734.

[2] John Hadley was a country gentleman of independent means, and the fact that he was the first to bring the construction of reflecting telescopes to any perfection has made many authors of astronomical books believe that he was a professional instrument maker. His brother George, who assisted him in his pursuits, was a barrister.

tected from the wind by a roof of plate-glass with perfectly parallel faces; sometimes a glass plate is used (with the lower surface blackened), which can be levelled on three screws by a circular level. The telescope is directed to the image of the celestial object reflected from the artificial horizon, and this image is made to coincide with that reflected from the index-glass. In this case the angle BCD will be double the altitude of the star. Towards the end of last and the beginning of this century the sextant was much used on land for determining latitudes, but, though in the hands of a skilful observer it can give results far superior to what one might expect from a small instrument held in the hand (or attached to a small stand), it has on shore been quite superseded by the portable altazimuth or theodolite, while at sea it continues to be indispensable.

The principle of the sextant has been applied to the construction of reflecting circles, on which the index arm is a diameter with a vernier at each end to eliminate the error of eccentricity. The circles constructed by Pistor and Martins of Berlin have a glass prism instead of the horizon glass and are extremely convenient. (J. L. E. D.)

SEXTUS EMPIRICUS. See Scepticism.

SEYCHELLES, an archipelago of the Indian Ocean, consisting of eighty islands—several of them mere islets—situated between 3° 38′ and 5° 45′ S. lat. and 52° 55′ and 53° 50′ E. long.,[1] about 1400 miles southeast of Aden and 1000 miles east of Zanzibar. They are the only small tropical oceanic islands of granitic structure, and rise steeply out of the sea, culminating in the island of Mahé, at an elevation of 2998 feet above the sea-level. The most northerly island is Bird, ½ by ¼ mile; the most southerly, Plate; the most easterly, Frégates; the most westerly, Silhouette. Mahé, the largest island of the group, 3 by 1½ miles,[1] is very nearly central, 60 miles south of Bird, and having to the north and northeast of it La Digne, Félicité, Praslin, and Curieuse. Only a few—Mahé, Praslin, La Digue, Denis, and Bird—are inhabited. The total area is about 50,120 acres, of which Mahé alone comprises 34,749.[1] The beaches of glistening calcareous sand are begirt by coral reefs which form a wall round the islands. The valleys and easier slopes are overlaid with a very fertile soil, and vegetation is most luxuriant. Though the climate is tropical, the heat is tempered and rendered uniform by the sea breezes, and probably this accounts for epidemic diseases and endemic fever being of uncommon occurrence. There are numerous brooks and torrents, making their way to the sea between blocks of granite. The islands are green and fresh at all times, particularly during the wet season from November to May. The total rainfall for 1881 was 113.50 inches. The extreme range of the thermometer in 1881 and 1882 was only 22° (minimum 71°, maximum 93°). The heat is seldom sultry and oppressive. The Seychelles lie too far to the north to receive the hurricanes which occasionally sweep over Bourbon and Mauritius, and even thunderstorms are rare. The population at the census of 1881 was 14,081 (7179 males and 6902 females)—500 white (mostly French creoles), 11,500 black, and 2000 coolies. Since 1881 the population has considerably increased in consequence of a tide of immigration from Mauritius. Men and women of exceptionally great age are frequently met with, and the death-rate for 1880 amounted to only 13.1 per 1000. The prevailing language is a French patois, but English is taught in the schools.

These islands were discovered at the beginning of the 16th century, but never occupied, by the Portuguese. In 1742 the French took possession of them, calling them at first Isles des Labourdonnais, but afterwards the Seychelles, from Count Hérault de Seychelles, an officer of the East Indian fleet. The first settlement was made in 1768 at Mahé, now Port Victoria. In 1794 the English wrested them from the French along with Mauritius, and they are now ruled by a board of six civil commissioners, as a dependency under the governor of Mauritius. In 1834 slavery was abolished, and since then the plantations have been in a declining state. In 1884 there were in the islands 20 primary schools aided by Government grants and attended by 1620 children. There are 16 churches belonging to the Roman Catholics (the dominant faith) and 11 to the Church of England. The main product is the cocoanut, but tobacco, coffee, rice, maize, sweet potatoes, and manioc are raised for home consumption, while cotton, pepper, cinnamon, and other spices grow wild. Many of the trees display simultaneously blossoms and unripe and ripe fruit. The so-called sea or Maldive double cocoanut "coco de mer," the fruit of the palm-tree *Lodoicea Sechellarum*, is peculiar to certain of these islands. It was long known only from sea-borne specimens cast up on the Maldive and other coasts, was thought to grow on a submarine palm, and, being esteemed a sovereign antidote to poisons (*Lusiad*, x. 136), commanded exorbitant prices in the East. This palm will grow to a height of 100 feet, and shows fern-like leaves of enormous size. Sensitive plants from America spread like lawns over the soil and quake at every step taken over them. The cocoanut palm flourishes in the gardens, overtopping the houses and most other trees, lining the shore, climbing high up the mountains, and in many places forming extensive forests. There are no native mammals, and domestic animals are scarce. The birds comprise gannets, terns in great numbers, and white egrets. Tortoises are common,—among them the gigantic turtle and black turtle, whose flesh is exported. The sea abounds in fish, many of them distinguished by splendid colors, and yields the inhabitants not only a large part of their animal food, but also material for building their houses,—a species of massive coral, *Porites gaimardi*, being hewn into square building blocks which at a distance glisten like white marble.

The principal harbor is Port Victoria, situated on Mahè island. The total value of imports here in 1884, including Rs 27,097 [$13,169.14] specie, was Rs.428,605 [$208,302.03], and of the exports, including Rs.21,582 [$10,488.85] specie, Rs.392,175 [$190,597.05]. The chief imports were coffee and cotton manufactures; the chief exports, cocoanut, cocoanut oil, and sperm oil. The fiscal receipts for 1884 amounted to Rs.130,047 [$63,202.84]. The cultivation of cocoa is progressing favorably, but the same cannot be said of the vanilla and clove plantations, which suffer from want of regular labor, attributed to the widespread share system, which the negroes prefer to regular work. The leaf disease affecting coffee has done great injury, and cocoanut plantations have suffered from the ravages of an insect, but no effort seems to have yet been made by weeding the plantations to stamp out the disease. Of the 34,749 acres of land making up Mahé, 12,000 acres are laid out in cocoanut, 500 in vanilla, coffee, and cloves, and 1500 are in forest; of the uncultivated land 8000 acres are well suited for vanilla, cocoa, and coffee plantations.

[1] [This longitude is that of the Amirante Islands. The Seychelles lie 160 miles further east. The area of Mahé is correct, but the dimensions should read from 1½ to 3 miles broad by 16 miles long. See Keith Johnston's *Gazetteer*.—Am. Ed.]

SEYMOUR, Edward. See Somerset, Duke of.

SEYNE, La, a town of France, in the department of Var, 5 miles southwest of Toulon, with a population of 9788 in 1881. It owes its importance mainly to its ship-building, the Société des Forges et Chantiers de la Méditerranée having here one of the finest building yards in Europe, in which more than 2000 workmen are employed; contracts are executed for private shipowners, for the great Messageries Maritimes Company, and for various Governments. The port, which has communication by steamer and omnibus with that of Toulon, is 6 acres in extent, and admits vessels of the largest tonnage.

SFAX, a city of Tunis, second in importance only to the capital, is situated 116 miles south of Mahadia, on the coast of the Gulf of Gabes (Syrtis Minor) opposite the Kerkenah Islands. It consists of three distinct portions: the new European quarter to the south, with roads, piers, and other improvements carried out by the municipality; the Arab town in the middle with its tower-flanked walls entered by only two gates; and to the north the French camp. Round the town for five or six miles to the north and west stretch orchards and gardens and country houses, where most of the Sfax families have their summer quarters. Dates, almonds, grapes, figs, peaches, apricots, olives, and in rainy years melons and cucumbers, grow there in great abundance without irrigation. Two enormous cisterns maintained by public charitable trusts supply the town with water in dry seasons. Sfax was formerly the terminus of a caravan route to Central Africa, but its inland trade now extends only to

Gafsa. The export trade (esparto grass, oil, almonds, pistachio nuts, sponges, wool, etc.) has attained considerable dimensions. Fifty-one English vessels (34,757 tons) visited the port in 1884. The anchorage is 2 miles from the shore, and there is a rise and fall of 5 feet at spring tides (a rare phenomenon in the Mediterranean). In 1881 the population was said to be about 15,000 (including 1200 Arabs, 1500 Tunisian Jews, 1000 Maltese, etc., 500 Europeans); in 1886 it is stated at 32,000 (1200 Maltese, 1000 Europeans).

Sfax (the Arabic Asfâkis or Safâkus, sometimes called the City of Cucumbers) occupies the site of the ancient *Taphrura*. In the Middle Ages it was famous for its vast export of olive oil. The Sicilians took Sfax under Roger the Norman in the 12th century, and the Spaniards occupied it for a brief period in the 16th century. The bombardment of the town in 1881 was one of the principal events of the French conquest of Tunis; it was pillaged by the soldiers on July 16th and the inhabitants had afterwards to pay a war indemnity of £250,000 [$1,215,000].

SFORZA, House of. See Milan, vol. xvi. p. 305, and Italy, vol. xiii. p. 489.

SHAD is the name given to certain migratory species of Herrings (*Clupea*), which are distinguished from the herrings proper by the total absence of teeth in the jaws. Two species occur in Europe, much resembling each other,—one commonly called Allis Shad (*Clupea alosa*), and the other known as Twaite Shad (*Clupea finta*). Both are, like the majority of herrings, greenish on the back and bright silvery on the sides, but they are distinguished from the other European species of *Clupea* by the presence of a large blackish blotch behind the gill-opening, which is succeeded by a series of several other similar spots along the middle of the side of the body. So closely allied are these two fishes that their distinctness can be proved only by an examination of the gill-apparatus, the allis shad having from sixty to eighty very fine and long gill-rakers along the concave edge of the first branchial arch, whilst the twaite shad possesses from twenty-one to twenty-seven stout and stiff gill-rakers only. In their habits and geographical distribution also the two shads are very similar. They inhabit the coasts of temperate Europe, the twaite shad being more numerous in the Mediterranean. While they are in salt water they live singly or in very small companies, but during May (the twaite shad some weeks later) they congregate, and in great numbers ascend large rivers, such as the Severn (and formerly the Thames), the Seine, the Rhine, the Nile, etc., in order to deposit their spawn,—sometimes traversing hundreds of miles, until their progress is arrested by some natural obstruction. A few weeks after they may be observed dropping down the river, lean and thoroughly exhausted, numbers floating dead on the surface, so that only a small proportion seem to regain the sea. Although millions of ova must be deposited by them in the upper reaches of a river, the fry does not seem to have been actually observed in fresh water, so that it seems probable that the young fish travel to the sea long before they have attained to any size.

On rivers in which these fishes make their periodical appearance they have become the object of a regular fishery, and their value increases in proportion to the distance from the sea at which they are caught. Thus they are much esteemed on the middle Rhine, where they are generally known as "Maifisch"; those caught on their return journey are worthless and uneatable. The allis shad is caught at a size from 15 to 24 inches and is considered to be better flavored than the twaite shad, which generally remains within smaller dimensions.

Other, but closely allied species, occur on the Atlantic coasts of North America, all surpassing the European species in importance as food fishes and economic value, viz., the American Shad (*Clupea sapidissima*), the Gaspereau or Ale-wife (*C. mattowocca*), and the Menhaden (*C. Menhaden*). See Menhaden.

SHADDOCK (*Citrus decumana*) is a tree allied to the orange and the lemon, presumably native to the Malay and Polynesian islands, but generally cultivated throughout the tropics. The leaves are like those of the orange, but downy on the under surface, as are also the young shoots. The flowers are large and white, and are succeeded by very large globose or pear-shaped fruits like oranges, but paler in color, and with less flavor. The name Shaddock is asserted to be that of a captain who introduced the tree to the West Indies. The fruit is also known under the name of pommeloes and "forbidden fruit." There are two varieties commonly met with, one with pale and the other with red pulp.

SHADWELL, Thomas (1640–1692), a playwright and miscellaneous versifier of the Restoration period, Dryden's successor in the laureateship, is remembered now, not by his works, though he was a prolific writer of comedies highly successful in their day, but as the subject of Dryden's satirical portraits "MacFlecknoe" and "Og." He was a native of Norfolk—not an Irishman, as he retorted with significant imbecility when Dryden's satire appeared,—went through the forms of study at Cambridge and the Inner Temple, travelled abroad for a little, returned to London, cultivated the literary society of coffee-houses and taverns, and in 1668, at the age of 28, gained the ear of the stage with a comedy *The Sullen Lovers*. For fourteen years afterwards, till his memorable encounter with Dryden he continued regularly to produce a comedy nearly every year, showing considerable cleverness in caricaturing the oddities of the time. Ben Jonson was his model, but he drew his materials largely from contemporary life. He also acquired standing among the wits as a talker. In the quarrel with Dryden he was the aggressor. They had been good enough friends, and Dryden in 1679 had furnished him with a prologue for his *True Widow*. But when Dryden threw in his lot with the court, and satirized the opposition in *Absalom and Achitophel* and *The Medal*, Shadwell was rash enough to constitute himself the champion of the true-blue Protestants and wrote a grossly personal and scurrilous attack on the poet, entitled *The Medal of John Bayes*. Dryden immediately retorted in *MacFlecknoe*, the most powerful and contemptuously scornful personal satire in our language, adding the next month a few more rough touches of supercilious mockery in the second part of *Absalom and Achitophel*, where Shadwell figures as "Og":

> Og from a treason-tavern rolling home,
> Round as a globe, and liquored every chink;
> Goodly and great he sails behind his link.

Dryden may not be strictly fair when he addresses his enemy as "thou last great prophet of tautology," and makes Flecknoe extol him because "he never deviates into sense," but Shadwell had fairly earned his chastisement, the sting of which lay in its substantial truth. He survived till 1692, and on Dryden's resignation of the laureateship in 1688 was promoted to the office, a sign of the poverty of the Whig side at the time in literary men, and part of the explanation of their anxiety in the next generation to secure literary talent.

A complete edition of Shadwell's works was published in 1720, in 4 vols. 12mo. His dramatic works are—*The Sullen Lovers*, 1668; *The Royal Shepherdess*, 1669; *The Humorist*, 1671; *The Miser*, 1672; *Epsom Wells*, 1673; *Psyche*, 1675; *The Libertine*, 1676; *The Virtuoso*, 1676; *Timon of Athens*, 1678; *A True Widow*, 1679; *The Woman Captain*, 1680; *The Lancashire Witches*, 1682; *The Squire of Alsatia*, 1688; *Bury Fair*, 1689; *The Amorous Bigot*, 1690; *The Scowerers*, 1691; and *The Volunteers*, 1693.

SHAF'Í, SHAF'ÍTES. See Sunnites.

SHAFTESBURY, Anthony Ashley Cooper, First Earl of (1621–1683), was the son of Sir John Cooper of Rockbourne in Hampshire, and of Anne, the only child of Sir Anthony Ashley, Bart., and was born at Wimborne St. Giles, Dorset, on July 22, 1621.

His parents died before he was ten years of age, and he inherited extensive estates in Hampshire, Wiltshire, Dorsetshire, and Somersetshire, much reduced, however, by litigation in chancery. He lived for some time with Sir Daniel Norton, one of his trustees, at Southwick, and upon his death in 1635 with Mr. Tooker, an uncle by marriage, at Salisbury. In 1637 he went as a gentleman-commoner to Exeter College, Oxford, where he remained about a year. No record of his studies is to be found, but he has left an amusing account of his part in the wilder doings of the university life of that day, in which, in spite of his small stature, he was recognized by his fellows as their leader. At the age of eighteen, on February 25, 1639, he married Margaret, daughter of Lord Coventry, with whom he and his wife lived at Durham House in the Strand, and at Canonbury House in Islington. In March, 1640, though still a minor, he was elected for Tewkesbury, and sat in the parliament which met on April 13, but appears to have taken no active part in its proceedings. In 1640 Lord Coventry died, and Cooper then lived with his brother-in-law at Dorchester House in Covent Garden. For the Long Parliament, which met on November 3, 1640, he was elected for Downton in Wiltshire, but the return was disputed, and he did not take his seat,—his election not being declared valid until the last days of the Rump. He was present as a spectator at the setting up of the king's standard at Nottingham on August 25, 1642; and in 1643 he appeared openly on Charles's side in Dorsetshire, where he raised at his own expense a regiment of foot and a troop of horse, of both of which he took the command. He was also appointed governor of Weymouth, sheriff of Dorsetshire for the king, and president of the king's council of war in the county. In the beginning of January, 1644, however, for reasons which are variously reported by himself and Clarendon, he resigned his governorship and commissions and went over to the Parliament. He appeared on March 6 before the standing committee of the two Houses to explain his conduct, when he stated he had come over because he saw danger to the Protestant religion in the king's service, and expressed his willingness to take the Covenant. In July, 1644, he went to Dorsetshire on military service, and on August 3 received a commission as field-marshal general. He assisted at the taking of Wareham, and shortly afterwards compounded for his estates by a fine of £500 [$2430] from which, however, he was afterwards relieved by Cromwell. On October 25 he was made commander-in-chief in Dorsetshire, and in November he took by storm Abbotsbury, the house of Sir John Strangways,—an affair in which he appears to have shown considerable personal gallantry. In December he relieved Taunton. His military service terminated at the time of the Self-denying Ordinance in 1645; he had associated himself with the Presbyterian faction, and naturally enough was not included in the New Model. For the next seven or eight years he lived in comparative privacy. He was high sheriff of Wiltshire during 1647, and displayed much vigor in this office. Upon the execution of Charles, Cooper took the Engagement, and was a commissioner to administer it in Dorsetshire. On April 25, 1650, he married Lady Frances Cecil, sister of the earl of Essex, his first wife having died in the previous year leaving no family. In 1651 a son was born to him, who died in childhood, and on January 16, 1652, another son, named after himself, who was his heir. On January 17 he was named on the commission for law reform, of which Hale was the chief, and on March 17, 1653, he was pardoned of all delinquency, and thus at last made capable of sitting in parliament. He sat for Wiltshire in the Barebones parliament, of which he was a leading member, and where he zealously and prudently supported Cromwell's views against the extreme section. He was at once appointed on the council of thirty. On the resignation of this parliament he became a member of the council of state named in the "Instrument." In the first parliament elected under this "Instrument" he sat for Wiltshire, having been elected also for Poole and Tewkesbury, and was one of the commissioners for the ejection of unworthy ministers. After December 28, 1654, for reasons which it is impossible to ascertain with clearness, he left the privy council, and henceforward is found with the Presbyterians and Republicans, in opposition to Cromwell. His second wife had died during this year; in 1656 he married a third, who survived him, Margaret, daughter of Lord Spencer, niece of the earl of Southampton, and sister of the earl of Sunderland, who died at Newbury. By his three marriages he was thus connected with many of the leading politicians of Charles II.'s reign.

Cooper was again elected for Wiltshire for the parliament of 1656, but Cromwell refused to allow him, with many others of his opponents, to sit. He signed a letter of complaint, with sixty-five excluded members, to the speaker, as also a "Remonstrance" addressed to the people. In the parliament which met on January 20, 1658, he took his seat, and was active in opposition to the new constitution of the two Houses. He was also a leader of the opposition in Richard Cromwell's parliament, especially on the matter of the limitation of the power of the Protector, and against the House of Lords. He was throughout these debates celebrated for the "nervous and subtle oratory" which made him so formidable in after days: he had "his tongue well hung, and words at will."

Upon the replacing of the Rump by the army, after the breaking up of Richard's parliament, Cooper endeavored unsuccessfully to take his seat on the ground of his former disputed election for Downton. He was, however, elected on the council of state, and was the only Presbyterian in it; he was at once accused by Scot, along with Whitelocke, of corresponding with Hyde. This he solemnly denied. After the rising in Cheshire Cooper was arrested in Dorsetshire on a charge of correspondence with its leader Booth, but on the matter being investigated by the council he was unanimously acquitted. In the disputes between Lambert at the head of the military party and the Rump in union with the council of state, he supported the latter, and upon the temporary supremacy of Lambert's party worked indefatigably to restore the Rump. With Monk's commissioners he, with Haselrig, had a fruitless conference, but he assured Monk of his co-operation, and joined with eight others of the overthrown council of state in naming him commander-in-chief of the forces of England and Scotland. He was instrumental in securing the Tower for the parliament, and in obtaining the adhesion of Admiral Lawson and the fleet. Upon the restoration of the parliament on December 26, Cooper was one of the commissioners to command the army, and on January 2 was made one of the new council of state. On January 7 he took his seat on his election for Downton in 1640, and was made colonel of Fleetwood's regiment of horse. He speedily secured the admission of the secluded members, having meanwhile been in continual communication with Monk, was again one of the fresh council of state, consisting entirely of friends of the Restoration, and accepted from Monk a commission to be governor of the Isle of Wight and captain of a company of foot. He now steadily pursued the design of the Restoration, but without holding any private correspondence with the king, and only on terms similar to those proposed in 1648 to Charles I. at the Isle of Wight. In the Convention Parliament he sat for Wiltshire. Monk cut short these deliberations, and forced on the Restoration without condition. Cooper was one of the twelve commissioners who went to Charles at Breda to invite him to return. On his journey he was upset from his carriage, and the accident caused an internal abscess which was never cured.

Cooper was at once placed on the privy council, receiving also a formal pardon for former delinquencies.

His first duty was to examine the Anabaptist prisoners in the Tower. In the prolonged discussions regarding the Bill of Indemnity he was instrumental in saving the life of Haselrig, and opposed the clause compelling all officers who served under Cromwell to refund their salaries, he himself never having had any. He showed, indeed, none of the grasping and avaricious temper so common among the politicians of the time. He was one of the commissioners for conducting the trials of the regicides, but was himself vehemently "fallen upon" by Prynne for having acted with Cromwell. He was named on the council of plantations and on that of trade. In the debate abolishing the court of wards he spoke, like most landed proprietors, in favor of laying the burden on the excise instead of on the land, and on the question of the restoration of the bishops carried in the interests of the court an adjournment of the debate for three months. At the coronation, in April, 1661, Cooper had been made a peer, as Baron Ashley of Wimborne St. Giles, in express recognition of his services at the Restoration; and on the meeting of the new parliament in May he was appointed chancellor of the exchequer and under-treasurer, aided, no doubt, by his connection with Southampton. He vehemently opposed the persecuting Acts now passed,—the Corporation Act, the Uniformity Bill, against which he is said to have spoken three hundred times, and the Militia Act. He is stated also to have influenced the king in issuing his dispensing declaration of December 26, 1662, and he zealously supported a bill introduced for the purpose of confirming the declaration, rising thereby in favor and influence with Charles. He was himself the author of a treatise on tolerance. He was now recognized as one of the chief opponents of Clarendon and the High Anglican policy. On the breaking out of the Dutch War in 1664 he was made treasurer of the prizes, being accountable to the king alone for all sums received or spent. He was also one of the grantees for the province of Carolina, and took a leading part in its management; it was at his request that Locke in 1669 drew up a constitution for the new colony. In September, 1665, the king unexpectedly paid him a visit at Wimborne. He opposed unsuccessfully the appropriation proviso introduced into the supply bill as hindering the due administration of finance, and this opposition seems to have brought about a reconciliation with Clarendon. In 1668, however, he supported a bill to appoint commissioners to examine into the accounts of the Dutch War, though in the previous year he had opposed it. In accordance with his former action on all questions of religious toleration, he strongly opposed the shameful Five Mile Act of 1665. In 1667 he eagerly supported the bill for prohibiting the importation of Irish cattle on the ground that it would lead to a great fall of rents in England. Ashley was himself a large landowner, and moreover was opposed to Ormonde, who would have greatly benefited by the importation. In all other questions of this kind he shows himself far in advance of the economic fallacies of the day. His action led to an altercation with Ossory, the son of Ormonde, in which Ossory used language for which he was compelled to apologize. On the death of Southampton, Ashley was placed on the commission of the treasury, Clifford and William Coventry being his principal colleagues. He appears to have taken no part in the attempt to impeach Clarendon on a general charge of treason.

The new administration was headed by Buckingham, in whose toleration and comprehension principles Ashley shared to the full. A most able paper written by him to the king in support of these principles, on the ground especially of their advantage to trade, has been preserved. He excepts, however, from toleration Roman Catholics and Fifth Monarchy men. His attention to all trade questions was close and constant; he was a member of the council of trade and plantations appointed in 1670, and was its president from 1672 to 1676. The difficulty of the succession also occupied him, and he coöperated thus early in the design of legitimizing Monmouth as a rival to James. In the intrigues which led to the infamous treaty of Dover he had no part. That treaty contained a clause by which Charles was bound to declare himself a Catholic, and with the knowledge of this Ashley, as a stanch Protestant, could not be trusted. In order to blind him and the other Protestant members of the Cabal a sham treaty was arranged in which this clause did not appear, and it was not until a considerable while afterwards that he found out that he had been duped. Under this misunderstanding he signed the Sham Dover treaty on December 31, 1670. This treaty, however, was carefully kept from public knowledge, and Ashley did not hesitate to help Charles to hoodwink parliament by signing a similar treaty on February 2, 1672, which was then laid before them as the only one in existence. This is one of the proved dishonorable actions of his life. His approval of the attempt of the Lords to alter a money bill led to the loss of the supply to Charles and to the consequent displeasure of the king. His support of the Lord Roos Act, ascribed generally to his desire to ingratiate himself with Charles, was no doubt due in part to the fact that his son had married Lord Roos's sister. It is, too, necessary to notice that, so far from advising the "Stop of the Exchequer," he actively opposed this bad measure; the reasons which he left with the king for his opposition are extant. The responsibility rests with Clifford alone. In the other great measure of the Cabal ministry, Charles's Declaration of Indulgence, he cordially concurred. He was now rewarded by being made Earl of Shaftesbury and Baron Cooper of Pawlett by a patent dated April 23, 1672. It is stated too that he was offered, but refused, the lord treasurership. On November 17, 1672, however, he became lord chancellor, Bridgman having been compelled to resign the seat. As chancellor he issued writs for the election of thirty-six new members to fill vacancies caused during the long recess; this, though grounded upon precedent, was certainly open to the gravest suspicion as an attempt to fortify Charles, and was vehemently attacked by an angry House of Commons which met on February 4, 1673. The writs were cancelled, and the principle was established that the issuing of writs rested with the House itself. It was at the opening of parliament that Shaftesbury made his celebrated "delenda est Carthago" speech against Holland, in which he urged the Second Dutch War, on the ground of the necessity of destroying so formidable a commercial rival to England, excused the Stop of the Exchequer which he had opposed, and vindicated the Declaration of Indulgence. On March 8 he announced to parliament that the declaration had been cancelled, though he did his best to induce Charles to remain firm. For affixing the great seal to this declaration he was threatened with impeachment by the Commons. The Test Act was now brought forward, and Shaftesbury, who appears to have heard how he had been duped in 1670, warmly supported it, with the object probably of thereby getting rid of Clifford. He now began to be regarded as the chief upholder of Protestantism in the ministry; he rapidly lost favor with Charles, and on Sunday, September 9, 1673, was dismissed from the chancellorship. Among the reasons for this dismissal is probably the undoubted fact that he opposed reckless grants to the king's mistresses. He has been accused of much vanity and ostentation in his office, but his reputation for ability and integrity as a judge was high even with his enemies.

Charles soon regretted the loss of Shaftesbury, and endeavored, as did also Louis, to induce him to return, but in vain. He preferred now to become the great popular leader against all the measures of the court, and may be regarded as the intellectual chief of the opposition. At the meeting of parliament on January

8, 1674, he carried a motion for a proclamation banishing Catholics to a distance of ten miles from London. During the whole session he organized and directed the opposition in their attacks on the king's ministers. On May 19 he was dismissed the privy council and ordered to leave London. He hereupon retired to Wimborne, from whence he urged upon his parliamentary followers the necessity of securing a new parliament. He was in the House of Lords, however, in 1675, when Danby brought forward his famous Nonresisting Test Bill, and headed the opposition which was carried on for seventeen days, distinguishing himself, says Burnet, more in this session than ever he had done before. The bill was finally shelved, a prorogation having taken place in consequence of a quarrel between the two Houses supposed to have been purposely got up by Shaftesbury, in which he vigorously supported the right of the Lords to hear appeal cases, even where the defendant was a member of the Lower House. Parliament was prorogued for fifteen months until February 15, 1677, and it was determined by the opposition to attack its existence on the ground that a prorogation for more than a year was illegal. In this matter the opposition were clearly in the wrong, and by attacking the parliament discredited themselves. The immediate result was that Shaftesbury, Buckingham, Wharton, and Salisbury were sent to the Tower. In June Shaftesbury applied for a writ of *habeas corpus*, but could get no release until February 26, 1678, after his letter and three petitions to the king. Being brought before the bar of the House of Lords he at length made a complete submission as to his conduct in declaring parliament dissolved by the prorogation, and in violating the Lords' privileges by bringing a *habeas corpus* in the King's Bench.

The breaking out of the Popish Terror in 1678 marks the worst part of Shaftesbury's career. That so clear-headed a man could have really credited the extravagant lies of Oates and the other perjurers is beyond belief; and the manner in which by incessant agitation he excited the most baseless alarms, and encouraged the wildest excesses of fanatic cruelty, for nothing but party advantage, is utterly without excuse. On November 2 he opened the great attack by proposing an address declaring the necessity for the king's dismissing James from his council. Under his advice the opposition now made an alliance with Louis whereby the French king promised to help them to ruin Danby on condition that they would compel Charles, by stopping the supplies, to make peace with France, doing thus a grave injury to Protestantism abroad for the sake of a temporary party advantage at home. Upon the refusal in November of the Lords to concur in the address of the Commons requesting the removal of the queen from court, he joined in a protest against the refusal, and was foremost in all the violent acts of the session. He urged on the bill by which Catholics were prohibited from sitting in either House of Parliament, and was bitter in his expressions of disappointment when the Commons passed a proviso excepting James, against whom the bill was especially aimed, from its operation. A new parliament met on March 6, 1679. Shaftesbury had meanwhile ineffectually warned the king that unless he followed his advice there would be no peace with the people. On March 25 he made a striking speech upon the state of the nation, especially upon the dangers to Protestantism and the misgovernment of Scotland and Ireland. He was, too, suspected of doing all in his power to bring about a revolt in Scotland. By the advice of Temple, Charles now tried the experiment of forming a new privy council in which the chief members of the opposition were included, and Shaftesbury was made president, with a salary of £4000 [$19,440], being also a member of the committee for foreign affairs. He did not, however, in any way change either his opinions or his action. He vigorously opposed the compelling of Protestant Nonconformists to take the oath required of Roman Catholics. That indeed, as Ranke says, which makes him memorable in English history is that he opposed the establishment of an Anglican and Royalist organization with decisive success. The question of the succession was now again prominent, and Shaftesbury, in opposition to Halifax, committed the error which really brought about his fall, of putting forward Monmouth as his nominee, thus alienating a large number of his supporters; he encouraged, too, the belief that this was agreeable to the king. He pressed on the Exclusion Bill with all his power, and, when that and the inquiry into the payments for secret service and the trial of the five peers, for which too he had been eager, were brought to an end by a sudden prorogation, he is reported to have declared aloud that he would have the heads of those who were the king's advisers to this course. Before the prorogation, however, he saw the invaluable Act of Habeas Corpus, which he had carried through parliament, receive the royal assent. In pursuance of his patronage of Monmouth, Shaftesbury now secured for him the command of the army sent to suppress the insurrection in Scotland, which he is supposed to have fomented. In October, 1679, the circumstances which led Charles to desire to conciliate the opposition having ceased, Shaftesbury was dismissed from his presidency and from the privy council; when applied to by Sunderland to return to office he made as conditions the divorce of the queen and the exclusion of James. With nine other peers he presented a petition to the king in November, praying for the meeting of parliament, of which Charles took no notice. In April, upon the king's declaration that he was resolved to send for James from Scotland, Shaftesbury strongly advised the popular leaders at once to leave the council, and they followed his advice. In March we find him unscrupulously eager in the prosecution of the alleged Irish Catholic plot. Upon the king's illness in May he held frequent meetings of Monmouth's friends at his house to consider how best to act for the security of the Protestant religion. On June 26, accompanied by fourteen others, he presented to the grand jury of Westminster an indictment of the duke of York as a Popish recusant. In the middle of September he was seriously ill. On November 15 the Exclusion Bill, having passed the Commons, was brought up to the Lords, and a historic debate took place, in which Halifax and Shaftesbury were the leaders on opposite sides. The bill was thrown out, and Shaftesbury signed the protest against its rejection. The next day he urged upon the House the divorce of the queen. On December 7, to his lasting dishonor, he voted for the condemnation of Lord Stafford. On the 23d he again spoke vehemently for exclusion, and his speech was immediately printed. All opposition was, however, checked by the dissolution on January 18. A new parliament was called to meet at Oxford, to avoid the influences of the city of London, where Shaftesbury had taken the greatest pains to make himself popular. Shaftesbury, with fifteen other peers, at once petitioned the king that it might as usual be held in the capital. He prepared, too, instructions to be handed by constituencies to their members upon election, in which exclusion, disbanding, the limitation of the prerogative in proroguing and dissolving parliament, and security against Popery and arbitrary power were insisted on. At this parliament, which lasted but a few days, he again made a personal appeal to Charles, which was curtly rejected, to permit the legitimizing of Monmouth. The king's advisers now urged him to arrest Shaftesbury; he was seized on July 2, 1681, and committed to the Tower, the judges refusing his petition to be tried or admitted to bail. This refusal was twice repeated in September and October, the court hoping to obtain evidence sufficient to ensure his ruin. In October he wrote offering to retire to Carolina if he were released. On November 24 he was in-

dicted for high treason at the Old Bailey, the chief ground being a paper of association for the defence of the Protestant religion, which, though among his papers, was not in his handwriting; but the grand jury ignored the bill. He was released on bail on December 1. In 1682, however, Charles secured the appointment of Tory sheriffs for London; and, as the juries were chosen by the sheriffs, Shaftesbury felt that he was no longer safe from the vengeance of the court. Failing health and the disappointment of his political plans led him now into violent courses. He appears to have entered into consultation of a treasonable kind with Monmouth and others; he himself had, he declared, ten thousand brisk boys in London ready to rise at his bidding. For some weeks he was concealed in the city and in Wapping; but, finding the schemes for a rising hang fire, he determined to flee. He went to Harwich, disguised as a Presbyterian minister, and after a week's delay, during which he was in imminent risk of discovery, if indeed, as is very probable, his escape was not winked at by the Government, he sailed to Holland on November 28, 1682, and reached Amsterdam in the beginning of December. Here he was welcomed with the jest, referring to his famous speech against the Dutch, "nondum deleta Carthago." He was made a citizen of Amsterdam, but died there of gout in the stomach on January 21, 1683. His body was sent in February to Poole, in Dorset, and was buried at Wimborne St. Giles.

Few politicians have been the mark of such unsparing abuse as Shaftesbury. Dryden, while compelled to honor him as an upright judge, overwhelmed his memory with scathing, if venal, satire; and Dryden's satire has been accepted as truth by later historians. Macaulay in especial has exerted all his art, though in flagrant contradiction of probability and fact, to deepen still further the shade which rests upon his reputation. Mr. Christie, on the other hand, in possession of later sources of information, and with more honest purpose, has done much to rehabilitate him. Occasionally, however, he appears to hold a brief for the defence, and, though his picture is comparatively a true one, should be read with caution. Finally, in his monograph in the series of "English Worthies," Mr. H. D. Traill professes to hold the scales equally. He makes an interesting addition to our conception of Shaftesbury's place in English politics, by insisting on his position as the first great party leader in the modern sense, and as the founder of modern parliamentary oratory. In other respects his book is derived almost entirely from Christie. Much of Shaftesbury's career, increasingly so as it came near its close, is incapable of defence; but it has escaped his critics that his life up to the Restoration, apparently full of inconsistencies, was evidently guided by one leading principle, the determination to uphold the supremacy of parliament, a principle which, however obscured by self-interest, appears also to have underlain his whole political career. He was, too, ever the friend of religious freedom and of an enlightened policy in all trade questions. And, above all, it should not be forgotten, in justice to Shaftesbury's memory, that "during his long political career, in an age of general corruption, he was ever incorrupt, and never grasped either money or land. In the days of the Commonwealth he never obtained or sought grants of forfeited estates. In the days of the restored monarchy he never profited by the king's favor for aught beyond the legal emoluments of office, and in office or out of office spurned all and many offers of bribes from the French king." (O. A.)

SHAFTESBURY, Anthony Ashley Cooper, Third Earl of (1671–1713), was born at Exeter House in London, February 26, 1670–71. He was grandson of the first and son of the second earl. His mother was Lady Dorothy Manners, daughter of John, earl of Rutland. According to a curious story, told by the third earl himself, the marriage between his father and mother was negotiated by John Locke, who was a trusted friend of the first earl. The second Lord Shaftesbury appears to have been a poor creature, both physically and mentally,—"born a shapeless lump, like anarchy," according to what is doubtless the exaggerated metaphor of Dryden. At the early age of three his son was made over to the formal guardianship of his grandfather. Locke, who in his capacity of medical attendant to the Ashley household had already assisted in bringing the boy into the world, though not his instructor, was entrusted with the superintendence of his education. This was conducted according to the principles enunciated in Locke's *Thoughts concerning Education*, and the method of teaching Latin and Greek conversationally was pursued with such success by his instructress, Mrs. Elizabeth Birch, that at the age of eleven, it is said, young Ashley could read both languages with ease. In November, 1683, some months after the death of the first earl, his father entered him at Winchester as a warden's boarder. Being a shy, retiring boy, and being moreover constantly taunted with the opinions and fate of his grandfather, he appears to have been rendered miserable by the rough manners of his schoolfellows, and to have left Winchester, in 1686, for a course of foreign travel. By this change he was brought into direct contact with those artistic and classical associations which afterwards exercised so marked an influence on his character and opinions. On his travels he did not, we are told by the fourth earl, "greatly seek the conversation of other English young gentlemen on their travels," but rather that of their tutors, with whom he could converse on congenial topics.

In 1689, the year after the Revolution, Lord Ashley returned to England, and for nearly five years from this time he appears to have led a quiet, uneventful, and studious life. There can be no doubt that the greater part of his attention was directed to the perusal of those classical authors, and to the attempt to realize the true spirit of that classical antiquity, for which he had conceived so ardent a passion. He had no intention, however, of becoming a recluse, or of permanently holding himself aloof from public life. Accordingly, he became a candidate for the borough of Poole, and was returned May 21, 1695. He soon distinguished himself by a speech, which excited great attention at the time, in support of the Bill for Regulating Trials in Cases of Treason, one provision of which was what seems to us the obviously reasonable one that a person indicted for treason or misprision of treason should be allowed the assistance of counsel. In connection with this speech a story is told of Shaftesbury which is also told, though with less verisimilitude, of Halifax, that, being overcome by shyness, and unable to continue his speech, he simply said, before sitting down: "If I, sir, who rise only to speak my opinion on the bill now depending, am so confounded that I am unable to express the least of what I proposed to say, what must the condition of that man be who is pleading for his life without any assistance and under apprehensions of being deprived of it?" "The sudden turn of thought," says his son, the fourth earl, "pleased the House extremely, and, it is generally believed, carried a greater weight than any of the arguments which were offered in favor of the bill." But, though a Whig, alike by descent, by education, and by conviction, Ashley could by no means be depended on to give a party vote; he was always ready to support any propositions, from whatever quarter they came, that appeared to him to promote the liberty of the subject and the independence of parliament. Unfortunately, his health was so treacherous that, on the dissolution of July, 1698, he was obliged to retire from parliamentary life. He suffered much from asthma, a complaint which was aggravated by the London smoke.

Lord Ashley now retired into Holland, where he became acquainted with Le Clerc, Bayle, Benjamin Furly, the English Quaker merchant, at whose house Locke had resided during his stay at Rotterdam, and probably Limborch and the rest of the literary circle of which Locke had been a cherished and honored member nine or ten years before. To Lord Ashley this society was probably far more congenial than his

surroundings in England. Unrestrained conversation on the topics which most interested him—philosophy, politics, morals, religion—was at this time to be had in Holland with less danger and in greater abundance than in any other country in the world. To the period of this sojourn in Holland must probably be referred the surreptitious impression or publication of an imperfect edition of the *Inquiry concerning Virtue*, from a rough draught, sketched when he was only twenty years of age. This liberty was taken, during his absence, by Toland.

After an absence of over a twelvemonth, Ashley returned to England, and soon succeeded his father as earl of Shaftesbury. He took an active part, on the Whig side, in the general election of 1700–1, and again, with more success, in that of the autumn of 1701. It is said that William III. showed his appreciation of Shaftesbury's services on this latter occasion by offering him a secretaryship of state, which, however, his declining health compelled him to decline. Had the king's life continued, Shaftesbury's influence at court would probably have been considerable. After the first few weeks of Anne's reign, Shaftesbury, who had been deprived of the vice-admiralty of Dorset, returned to his retired mode of life, but his letters to Furly show that he still retained a keen interest in politics. In August, 1703, he again settled in Holland, in the air of which he seems, like Locke, to have had great faith. At Rotterdam he lived, he says in a letter to his steward Wheelock, at the rate of less than £200 [$972] a year, and yet had much "to dispose of and spend beyond convenient living." He returned to England, much improved in health, in August, 1704. But, though he had received immediate benefit from his stay abroad, symptoms of consumption were constantly alarming him, and he gradually became a confirmed invalid. His occupations were now almost exclusively literary, and from this time forward he was probably engaged in writing, completing, or revising the treatises which were afterwards included in the *Characteristics*. He still continued, however, to take a warm interest in politics, both home and foreign, and especially in the war against France, of which he was an enthusiastic supporter.

Shaftesbury was nearly forty before he married, and even then he appears to have taken this step at the urgent instigation of his friends, mainly to supply a successor to the title. The object of his choice (or rather of his second choice, for an earlier project of marriage had shortly before fallen through) was a Miss Jane Ewer, the daughter of a gentleman in Hertfordshire. The marriage took place in the autumn of 1709, and on February 9, 1710, was born at his house at Reigate, in Surrey, his only child and heir, the fourth earl, to whose manuscript accounts we are in great part indebted for the details of his father's life. The match appears to have been a happy one, though Shaftesbury neither had nor pretended to have much sentiment on the subject of married life.

With the exception of a *Preface to the Sermons of Dr. Whichcote*, one of the Cambridge Platonists or latitudinarians, published in 1698, Shaftesbury appears to have printed nothing himself till the year 1708. About this time the French prophets, as they were called, attracted much attention by the extravagances and follies of which they were guilty. Various remedies of the repressive kind were proposed, but Shaftesbury maintained that their fanaticism was best encountered by "raillery" and "good-humor." In support of this view he wrote a letter to Lord Somers, dated September, 1707, which was published anonymously in the following year, and provoked several replies. In May, 1709, he returned to the subject, and printed another letter, entitled *Sensus Communis, an Essay on the Freedom of Wit and Humor*. In the same year he also published *The Moralist, a Philosophical Rhapsody*, and in the following year *Soliloquy, or Advice to an Author*. None of these pieces seem to have been printed either with his name or his initials. In 1711 appeared the *Characteristics of Men, Manners, Opinions, Times*, in three volumes, also without any name or initials on the title-page, and without even the name of a printer. These three handsome volumes contain in addition to the four treatises already mentioned, *Miscellaneous Reflections*, now first printed, and the *Inquiry concerning Virtue or Merit*, described as "formerly printed from an imperfect copy, now corrected and published intire," and as "printed first in the year 1699."

The declining state of Shaftesbury's health rendered it necessary for him to seek a warmer climate, and in July, 1711, he set out for Italy. He settled at Naples in November, and lived there considerably over a year. His principal occupation at this time must have consisted in preparing for the press a second edition of the *Characteristics*, which appeared in 1713, soon after his death. The copy, most carefully corrected in his own handwriting, is still preserved in the British Museum. He was also engaged, during his stay at Naples, in writing the little treatise (afterwards included in the *Characteristics*) entitled *A Notion of the Historical Draught or Tablature of the Judgment of Hercules*, and the letter concerning *Design*. A little before his death he had also formed a scheme of writing a Discourse on the Arts of Painting, Sculpture, Etching, etc., but when he died he had made but little progress with it. "Medals, and pictures, and antiquities," he writes to Furly, "are our chief entertainments here." His conversation was with men of art and science, "the virtuosi of this place."

The events preceding the peace of Utrecht, which he regarded as preparing the way for a base desertion of our allies, greatly troubled the last months of Shaftesbury's life. He did not, however, live to see the actual conclusion of the treaty (March 31, 1713), as he died the month before, February 4, 1712, O.S. At the time of his death he had not yet completed his forty-second year. His body was brought back by sea to England and buried at St. Giles's, the family seat in Dorsetshire. Though he died so long ago, and was one of the earliest of the English moralists, his descendant, the celebrated philanthropist, who died so recently as 1885, was only his great-grandson.

Shaftesbury's amiability of character seems to have been one of his principal characteristics. All accounts concur in representing him as full of sweetness and kindliness towards others, though he may sometimes himself have been the victim of melancholy and despondency. Like Locke he had a peculiar pleasure in bringing forward young men. Among these may be especially mentioned Michael Ainsworth, a native of Wimborne St. Giles, the young man who was the recipient of the *Letters* addressed to a student at the university, and who was maintained by him at University College, Oxford. The keen interest which Shaftesbury took in his studies, and the desire that he should be specially fitted for the profession which he had selected, that of a clergyman of the Church of England, are marked features of the letters. Other protegés were Crell, a young Pole, the two young Furlys, and Harry Wilkinson, a boy who was sent into Furly's office at Rotterdam, and to whom several of the letters still extant in the Record Office are addressed.

In the popular mind, Shaftesbury is generally regarded as a writer hostile to religion. But, however short his orthodoxy might fall if tried by the standards of any particular church, his temperament was preëminently a religious one. This fact is shown conspicuously in his letters, where he had no reason for making any secret of his opinions. The belief in a God, all-wise, all-just, and all-merciful, governing the world providentially for the best, pervades all his works, his correspondence, and his life. Nor had he any wish to undermine established beliefs, except where he conceived that they conflicted with a truer religion and a purer morality.

To the public ordinances of the church he scrupulously conformed. But unfortunately, there were many things both in the teaching and the practice of the ecclesiastics of that day which were calculated to repel men of sober judgment and high principle. These evil tendencies in the popular presentation of Christianity undoubtedly begot in Shaftesbury's mind a certain amount of repugnance and contempt to some of the doctrines of Christianity itself; and, cultivating, almost of set purpose, his sense of the ridiculous, he was too apt to assume towards such doctrines and their teachers a tone of raillery and banter, which sometimes even approaches grimace.

But, whatever might be Shaftesbury's speculative opinions or his mode of expressing them, all witnesses concur in bearing testimony to the elevation and purity of his life and aims. Molesworth, who had no special reason for flattering him, speaks of him as "possessing right reason in a more eminent degree than the rest of mankind," and of his character as "the highest that the perfection of human nature is capable of." Even Warburton, in his dedication of the *Divine Legation* to the free-thinkers, is compelled to "own that this lord had many excellent qualities, both as a man and a writer. He was temperate, chaste, honest, and a lover of his country."

As an earnest student, an ardent lover of liberty, an enthusiast in the cause of virtue, and a man of unblemished life and untiring beneficence, Shaftesbury probably had no superior in his generation. His character and pursuits are the more remarkable considering the rank of life in which he was born and the circumstances under which he was brought up. In many respects he reminds us of the imperial philosopher Marcus Aurelius, whose works we know him to have studied with avidity, and whose influence is unmistakably stamped upon his own productions.

Most of Shaftesbury's writings have been already mentioned. In addition to these there have been published fourteen letters from Shaftesbury to Molesworth, edited by Toland in 1721; some letters to Benjamin Furly, his sons, and his clerk Harry Wilkinson, included in a volume entitled *Original Letters of Locke, Sidney, and Shaftesbury*, which was published by Mr. T. Forster in 1830, and again in an enlarged form in 1847; three letters, written respectively to Stringer, Lord Oxford, and Lord Godolphin, which appeared, for the first time, in the *General Dictionary;* and lastly a letter to Le Clerc, in his recollections of Locke, first published in *Notes and Queries*, Feb. 8, 1851. The *Letters to a Young Man at the University* [Michael Ainsworth], already mentioned, were first published in 1716, it being uncertain by whom. The Letter on Design was first published in the edition of the *Characteristics* issued in 1732. Besides the published writings, there are still to be found several memoranda, letters, rough drafts, etc., in the Shaftesbury papers in the Record Office.

Shaftesbury, it is plain, took great pains in the elaboration of his style, and he succeeded so far as to make his meaning transparent. The thought is always clear. But, on the other hand, he did not equally succeed in attaining elegance, an object at which he seems equally to have aimed. There is a curious affectation about his style,—a falsetto note,—which, notwithstanding all his efforts to please, is often irritating to the reader. Its main characteristic is perhaps best hit off by Charles Lamb when he calls it "genteel." He poses too much as a fine gentleman, and is so anxious not to be taken for a pedant of the vulgar scholastic kind that he falls into the hardly more attractive pedantry of the æsthete and *virtuoso*. But, notwithstanding these defects, he possesses the great merits of being easily read and easily understood. Hence, probably, the wide popularity which his works enjoyed in the last century; and hence, undoubtedly, the agreeable feeling with which, notwithstanding all their false taste and their tiresome digressions, they still impress the modern reader.

It is mainly as a moralist that Shaftesbury has a claim to a place in the history of literature and philosophy. Like most of the ethical writers of his time his first impulse to speculation, or at least to publication, seems to have been derived from a desire to combat the still fashionable paradoxes of Hobbes, and to arrest the progress of doctrines at which society still continued to be seriously alarmed. Hence it became his main concern to assert the reality and independence of our benevolent affections, and to show that these and the acts which result from them are what mainly elicit the feeling of moral approbation. This work he appears to have conceived it his special mission to undertake, not as a "pedant" or a "Schoolman," but as a "man of taste." It was probably in accordance with this conception that he refrained from using the language about the "laws of nature" which had hitherto been current in ethical treatises, and that he preferred to represent morality as a matter of "taste," "sentiment," or "affection," rather than as dictated simply by reason.

The leading ideas in Shaftesbury's ethical theory are those of a system, or the relation of parts to a whole, benevolence, moral beauty, and a moral sense.

The individual man himself is a system consisting of various appetites, passions, and affections, all united under the supreme control of reason. Of this system the parts are so nicely adjusted to each other that any disarrangement or disproportion, however slight, may mar and disfigure the whole. "Whoever is in the least versed in this moral kind of architecture will find the inward fabric so adjusted, and the whole so nicely built, that the barely extending of a single passion a little too far, or the continuance of it too long, is able to bring irrecoverable ruin and misery."

But morality and human nature cannot be adequately studied in the system of the individual man. There are parts in that system, both mental and bodily, which have an evident respect to something outside it. Neither man nor any other animal, though ever so complete a system of parts as to all within, can be allowed in the same manner complete as to all without: he must be considered as having a further relation abroad to the system of his kind. So even this system of his kind to the animal system; this to the world (our earth); and this again to the bigger world and to the universe. No being can properly be called good or ill except in reference to the systems of which he is a part. "When, in general, all the affections or passions are suited to the public good or end of the species, then is the natural temper entirely good. If, on the contrary, any requisite passion be wanting, or if there be one supernumerary or weak, or anywise disserviceable or contrary to that main end, then is the natural temper, and consequently the creature himself, in some measure corrupt and ill." Hence it follows that benevolence, if not the sole, is at least the principal moral virtue.

The idea of a moral and social system, the parts of which are in a constant proportion to each other, and so nicely adjusted that the slightest disarrangement would mar the unity of design, almost necessarily suggests an analogy between morality and art. As the beauty of an external object consists in a certain proportion between its parts, or in a certain harmony of coloring, so the beauty of a virtuous character consists in a certain proportion between the various affections, or in a certain harmonious blending of the various springs of action as they contribute to promote the great ends of our being. And similarly, we may suppose, the beauty of a virtuous action would be explained as consisting in its relation to the virtuous character in which it has its source, or to the other acts of a virtuous life, or to the general condition of a virtuous state of society. This analogy between art and morality, or, as it may otherwise be expressed, between the beauty of external objects and the beauty of actions or characters, is never long absent from Shaftesbury's mind. Closely connected with it is the idea that morals, no less than art, is a matter of taste or relish.

This idea leads us to the last of the distinctive features in Shaftesbury's ethical philosophy. The faculty which approves of right and disapproves of wrong actions is with him a sense, and more than once he anticipates Hutcheson by calling it a "moral sense," an expression, indeed, which he may be said to have contributed to the English language. This "sense of right and wrong" is "as natural to us as natural affection itself," and "a first principle in our constitution and make." At the same time it includes a certain amount of judgment or reflection, that is to say, a rational element. Shaftesbury's doctrine on this head may, perhaps, briefly be summed up as follows: Each man has from the first a natural sense of right and wrong, a "moral sense" or "conscience" (all which expressions he employs as synonymous). This sense is, in its natural condition, wholly or mainly emotional, but, as it admits of constant education and improvement, the rational or reflective element in it gradually becomes more prominent. Its decisions are generally described as if they were immediate, and, beyond the occasional recognition of a rational as well as an emotional element, little or no attempt is made to analyze it. It was reserved for Hume properly to discriminate between these two elements, and to point out that, while the feeling of moral approbation or disapproba-

tion is instantaneous, the moral judgment which precedes it is often the result of an intellectual process of considerable length and perplexity.

It may be sufficient to supplement this brief survey of Shaftesbury's system by a still briefer summary of the answers, so far as they can be collected from his works, which he would have given to the principal questions of ethics as they are now usually propounded. His answers to these questions are, as it appears to the present writer, that our moral ideas—the distinctions of virtue and vice, right and wrong—are to be found in the very make and constitution of our nature; that morality is independent of theology, actions being denominated good or just, not by the arbitrary will of God (as had recently been maintained by Locke), but in virtue of some quality existing in themselves; that the ultimate test of a right action is its tendency to promote the general welfare: that we have a peculiar organ, the moral sense, analogous to taste in art, by which we discriminate between characters and actions as good or bad; that the higher natures among mankind are impelled to right action, and deterred from wrong action, partly by the moral sense, partly by the love and reverence of a just and good God, while the lower natures are mainly influenced by the opinions of others, or by the hope of reward and the fear of punishment; that appetite and reason both concur in the determination of action; lastly, that the question whether the will does or does not possess any freedom of choice, irrespectively of character and motives, is one (at least so we may gather from Shaftesbury's reticence) which it does not concern the moralist to solve.

The close resemblance of Hutcheson's speculations to those of Shaftesbury, amounting sometimes to identity, will be apparent on reference to the account of that philosopher (vol. xii. pp. 423–7). Next to Hobbes, the moralist with whose views Shaftesbury's stand in most direct antagonism is Locke, who not only maintained that moral distinctions depend solely on the arbitrary will of God, but that the sanctions by which they are mainly enforced are the hope of future reward and the fear of future punishment. "By the fault is the rod, and with the transgression a fire ready to punish it." Shaftesbury's was in reality, though perhaps not in appearance, a more truly religious philosophy. For with him the incentives to well-doing and the deterrents from evil doing are to be sought not solely, or even mainly, in the opinion of mankind, or in the rewards and punishments of the magistrate, or in the hopes and terrors of a future world, but in the answer of a good conscience approving virtue and disapproving vice, and in the love of a God, who, by His infinite wisdom and His all-embracing beneficence, is worthy of the love and admiration of His creatures.

The main object of the *Moralists* is to propound a system of natural theology, and to vindicate, so far as natural religion is concerned, the ways of God to man. The articles of Shaftesbury's religious creed were few and simple, but these he entertained with a conviction amounting to enthusiasm. They may briefly be summed up as a belief in one God whose most characteristic attribute is universal benevolence, in the moral government of the universe, and in a future state of man making up for the imperfections and repairing the inequalities of the present life. Shaftesbury is emphatically an optimist, but there is a passage in the *Moralists* (pt. ii. sec. 4) which would lead us to suppose that he regarded matter as an indifferent principle, co-existent and co-eternal with God, limiting His operations, and the cause of the evil and imperfection which, notwithstanding the benevolence of the Creator, is still to be found in His work. If this view of his optimism be correct, Shaftesbury, as Mill says of Leibnitz, must be regarded as maintaining, not that this is the best of all imaginable but only of all possible worlds. This brief notice of Shaftesbury's scheme of natural religion would be conspicuously imperfect unless it were added that it is popularized in Pope's *Essay on Man*, several lines of which, especially of the first epistle, are simply statements from the *Moralists* done into verse. Whether, however, these were taken immediately by Pope from Shaftesbury, or whether they came to him through the papers which Bolingbroke had prepared for his use, we have no means of determining.

Shaftesbury's philosophical activity was confined to ethics, æsthetics, and religion. For metaphysics, properly so called, and even psychology, except so far as it afforded a basis for ethics, he evidently had no taste. Logic he probably despised as merely an instrument of pedants,—a judgment for which, in his day, and especially at the universities, there was only too much ground.

The influence of Shaftesbury's writings was very considerable both at home and abroad. His ethical system was reproduced, though in a more precise and philosophical form, by Hutcheson, and from him descended, with certain variations, to Hume and Adam Smith. Nor was it without its effect even on the speculations of Butler. Of the so-called deists Shaftesbury was probably the most important, as he was certainly the most plausible and the most respectable. No sooner had the *Characteristics* appeared than they were welcomed, in terms of warm commendation, by Le Clerc and Leibnitz. In 1745 Diderot adapted or reproduced the *Inquiry concerning Virtue* in what was afterwards known as his *Essai sur le Mérite et la Vertu*. In 1769 a French translation of the whole of Shaftesbury's works, including the *Letters*, was published at Geneva. Translations of separate treatises into German began to be made in 1738, and in 1776–1779 there appeared a complete German translation of the *Characteristics*. Hermann Hettner says that not only Leibnitz, Voltaire, and Diderot, but Lessing, Mendelssohn, Wieland, and Herder, drew the most stimulating nutriment from Shaftesbury. "His charms," he adds, "are ever fresh. A new-born Hellenism, or divine cultus of beauty presented itself before his inspired soul." Herder is especially eulogistic. In the *Adrastea* he pronounces the *Moralists* to be a composition in form well-nigh worthy of Grecian antiquity, and in its contents almost superior to it. The interest felt by German literary men in Shaftesbury has been recently revived by the publication of two excellent monographs, one dealing with him mainly from the theological side by Dr. Gideon Spicker (Freiburg in Baden, 1872), the other dealing with him mainly from the philosophical side by Dr. Georg von Gizycki (Leipsic, 1876).

In the foregoing article the writer has made free use of his monograph on Shaftesbury and Hutcheson in the series of "English philosophers" (1882), published by Sampson Low & Co. In that work he was able largely to supplement the printed materials for the Life by extracts from the Shaftesbury papers now deposited in the Record Office. These include, besides many letters and memoranda, two lives of him, composed by his son, the fourth earl, one of which is evidently the original, though it is by no means always closely followed, of the Life contributed by Dr. Birch to the *General Dictionary*. For a description and criticism of Shaftesbury's philosophy reference may also be made to Mackintosh's *Progress of Ethical Philosophy*, Whewell's *History of Moral Philosophy in England*, Jouffry's *Introduction to Ethics* (Channing's translation), Leslie Stephen's *English Thought in the Eighteenth Century*, Martineau's *Types of Ethical Theory*, and the article ETHICS in the present work (vol. viii. pp. 527–528). For his relation to the religious and theological controversies of his day, see, in addition to some of the above works, Leland's *View of the Principal Deistical Writers*, Lechler's *Geschichte des Englischen Deismus*, Hunt's *Religious Thought in England*, Abbey and Overton's *English Church in the Eighteenth Century*, and A. S. Farrar's Bampton Lectures. (T. F.)

SHAFTESBURY, ANTHONY ASHLEY COOPER, SEVENTH EARL OF (1801–1885). was the son of Cropley, sixth earl, and Anne, daughter of the third duke of Marlborough, and was born 28th April, 1801. He was educated at Harrow and Christ Church, Oxford, where he obtained a first class in classics in 1822, and graduated M.A. in 1832. In 1841 he received from his university the degree of D.C.L. He entered parliament as member for the pocket borough of Woodstock in 1826; in 1830 he was returned for Dorchester; from 1831 till February, 1846, he represented the county of Dorset; and he was member for Bath from 1847 till (having previously borne the courtesy title Lord Ashley) he succeeded his father as earl in 1851. Although giving a general support to the Conservatives, his parliamentary conduct was greatly modified by his intense interest in the improvement of the social condition of the working classes, his efforts in behalf of whom have made his name a household word. He opposed the Reform Bill of 1832, but was a supporter of Catholic emancipation, and his objection to the continuance of resistance to the abolition of the Corn Laws led him to resign his seat for Dorset in 1846. In parliament his name, more than any other, is associated with the factory legislation (see FACTORY ACTS, vol. viii. p. 740). He was a lord of the admiralty under Sir Robert Peel (1834–35), but on being invited to join Peel's administration in 1841 refused, having been unable to obtain Peel's support for the Ten Hours' Bill. Chiefly by his persistent efforts a Ten Hours' Bill was carried in 1847, but its operation was impeded by legal difficulties, which were only removed by successive Acts, instigated chiefly by him, until legislation reached a final stage in the Factory Act of 1874. The part which he took in the legislation bearing on coal mines was equally prominent. It is worthy of notice that his efforts in behalf of the practical welfare of the

working classes were guided by his own personal knowledge of their circumstances and wants. Thus in 1846 he took advantage of his leisure after the resignation of his seat for Dorset to explore the slums of the metropolis, and by the information he obtained not only gave a new impulse to the movement for the establishment of ragged schools, but was able to make it more widely beneficial. For over forty years he was president of the Ragged School Union. He was also one of the principal founders of reformatory and refuge unions, young men's Christian associations, and working men's institutes. He took an active interest in foreign missions, and was president of several of the most important philanthropic and religious societies of London. He died 1st October, 1885. By his marriage to Lady Emily, daughter of the fifth Earl Cowper, he left a large family, and was succeeded by his eldest son Anthony, who committed suicide shortly afterwards.

SHAGREEN. See LEATHER, vol. xiv. pp. 390–1, and SHARK.

SHÁHÁBÁD, a British district in the Patna division of the lieutenant-governorship of Bengal, India, between 24° 31′ and 25° 43′ N. lat. and between 83° 23′ and 84° 55′ E. long., with an area of 4365 square miles. It is bounded on the N. by the district of Ghazipur in the Northwestern Provinces and by Saran, on the E. by Patna and Gayá districts, on the S. by Lohardaga, and on the W. by Mirzapur, Benares, and Ghazipur districts of the Northwestern Provinces. About three-fourths of the whole area lying to the north is an alluvial flat, wholly under cultivation, and fairly planted with mangoes, bamboos, and other trees; while the southern portion of the district is occupied by the Kaimur Hills, a branch of the great Vindhyan range, and is a densely wooded tract. The chief rivers are the Ganges and the Son, which unite in the north-eastern corner of Sháhábád. A series of canals on the Son are reported to have secured for the district immunity from future famine. In the southern portion of the district large game abounds, including the tiger, bear, leopard, and several varieties of deer; and among other animals met with are the wild boar, hyena, jackal, and fox. The nylghau is seen on the Kaimur Hills. The climate is very sultry, and the rains heavy. The East Indian Railway traverses the north of the district for 60 miles, and the aggregate length of road is about 1000 miles.

The census of 1881 disclosed a population of 1,964,909 (males 950,250, females 1,014,659); Hindus numbered 1,817,-881, Mohammedans 146,732, and Christians 274. Four towns contain a population exceeding 10,000, viz., Arrah 42,998, Dumraon 17,429, Baxar 16,498, and Jagdispur 12,568. The administrative headquarters of the district are at Arrah. The chief staple of Sháhábád is rice, which produces three crops during the year; wheat, barley, maize, cereals, and various other plants are also grown. The principal manufactures of the district are sugar, paper, saltpetre, blankets, coarse cotton cloth, and brass utensils. Its trade is chiefly carried on by means of permanent markets in the town and at fairs. The principal exports are rice, wheat, barley, pulses, grain, oats, linseed, caraway seed, paper, and spices; imports consist of cleaned rice, betel-nut, tobacco, sugar, molasses, salt, pepper, cotton, iron, brass, zinc, copper, lead, tin, and betel-leaf. The revenue of Sháhábád district in 1883–84 amounted to £253,-542, of which the land yielded £171,263. The southern part of the district was ceded to the British by Shah Alum, emperor of Delhi in 1765, and the northern part by Azuf-ud-Dowlah, vizier of Oudh, ten years later.

SHÁH JAHÁN, Mogul emperor from 1627 to 1658. See INDIA, vol. xii. p. 834.

SHÁHJAHÁNPUR, the easternmost district of the Rohilkhand division in the lieutenant-governorship of the Northwestern Provinces of British India, lying between 27° 36′ and 28° 29′ N. lat. and between 79° 23′ and 80° 26′ E. long. It has an area of 1746 square miles, and is bounded on the N. and N.W. by Pilibhit, on the E. by Hardoi and Kheri, on the S. by the Ganges, separating it from Farukhabad, and on the W. by Budaun and Bareilly. The district consists of a long and narrow tract running up from the Ganges towards the Himalayas, and is for the most part level and without any hills or considerable undulations. The principal rivers are the Gumti, Khanaut, Garái, and Rámganga. The last-named is the main waterway of the district, and is navigable as far as Kola Ghat near Jalálábád, whence grain is shipped for the Ganges ports. To the northeast beyond Gumti the country resembles the *tarai* in the preponderance of waste and forest over cultivated land, in the sparseness of population, and in general unhealthiness. Between the Gumti and the Khanaut the country varies from a rather wild and unhealthy northern region to a densely inhabited tract in the south, with a productive soil well cultivated with sugar-cane and other remunerative crops. The section between the Deoha and Garái comprises much marshy land; but south of the Garái, and between it and the Rámganga, the soil is mostly of a sandy nature. From Rámganga to the Ganges in the south is a continuous low country of marshy patches alternating with a hard clayey soil requiring much irrigation in parts. Sháhjahánpur contains a number of jhils or lakes, which afford irrigation for the spring crops in their neighborhood. The Oudh and Rohilkhand Railway traverses the district a distance of 39 miles. The climate of the district is very similar to that of most parts of Oudh and Rohilkhand, but moister than that of the Doab. Except in May and June, the country has a fresh and green appearance. Its average annual rainfall is about 38 inches.

In 1881 the population of Sháhjahánpur numbered 856,-946 (males 460,064, females 396,882), of whom 735,244 were Hindus and 120,214 were Mohammedans. The district contains only two towns with a population exceeding 10,000, viz., SHÁHJAHÁNPUR (*q.v.*) and Tilhar (15,351). Of the total area of 1746 square miles 1090 were under cultivation in 1883–84, and 464 were returned as cultivable. The chief agricultural products are wheat and gram in spring, and in the autumn sugar-cane, rice, joar, and bajra, and several kinds of pulses. Exports are chiefly sugar, grain of all kinds, pulses, indigo, cotton, and timber, and the imports are mainly European goods, metals, and salt. The gross revenue raised in the district in 1883–84 amounted to £186,162 [$904,747.32], of which the land contributed £118,638 [$576,580.68]. The only manufactures of any importance under European supervision are those of sugar and rum and of indigo. Sháhjahánpur was ceded to the English by treaty in 1801. During the mutiny of 1857 it became the scene of open rebellion. The Europeans were attacked when in church; three were shot down, but the remainder, aided by a hundred faithful sepoys, escaped. The force under Lord Clyde put a stop to the anarchy in April, 1858, and shortly afterwards peace and authority were restored.

SHÁHJAHÁNPUR, municipal town and administrative headquarters of the above district, lies in 27° 53′ 41″ N. lat. and 79° 57′ 30″ E. long., on the left bank of the Deoha. It is a large place, with some stately old mosques and a castle now in ruins. The city was founded in 1647 during the reign of Sháh Jahán, whose name it bears, by Nawáb Bahádur Khán, a Pathán. It has a considerable export trade in cereals, pulses, and sugar. In 1881 the population was 74,830 (36,840 males, and 37,990 females).

SHÁHPUR, the southernmost district of the Rawal Pindi division in the lieutenant-governorship of the Punjab, India, between 31° 32′ and 32° 42′ N. lat. and between 71° 37′ and 73° 24′ E. long., with an area of 4691 square miles. The district is bounded on the N. by the Jhelum district, on the E. by Gujrát and the Chenab, on the S. by Jhang, and on the W. and N.W. by Dera Ismail Khan and Bannu. On both sides of the Jhelum stretch wide upland plains, utterly barren or covered only with brushwood; a considerable portion of this area, however, is composed of good soil, only requiring irrigation to make it productive. The most important physical subdivisions of the district are the Salt range in the north, the valleys of the Chenáb and Jhelum, and the plains between those

rivers and between the Jhelum and the Salt range. The characteristics of these two plains are widely different: the desert portion of the southern plain is termed the *bar;* the corresponding tract north of the Jhelum is known as the *thal.* That part of Sháhpur to the north of the Jhelum is by far the most interesting, containing as it does such varieties of scenery and climate, such contrasts of soil, vegetation, and natural capabilities. Communications are carried on by well-made roads, by the Jhelum, which is navigable for country craft throughout its course within the district, and by 52 miles of the Salt branch of the Punjab Northern State Railway. The climate of the plains is hot and dry, but in the Salt range it is much cooler; the average annual rainfall is about 15 inches. Tigers, leopards, and wolves are found in the Salt range, while small game and antelope abound among the thick jungle of the *bar.*

The census of 1881 disclosed a population of 421,508 (males 221,676, females 199,832); of these 59,026 were Hindus and 357,742 were Mohammedans. The only town in the district with more than 10,000 inhabitants is Bhera, with 15,165; but the administrative headquarters of the district are at the small town of Shahpur on the Jhelum river, the population of which in 1881 was 5424. Of the total area only 871 square miles were under cultivation in 1883-84, and 3053 square miles were returned as cultivable. Wheat is the chief staple, and covers nearly a half of the cultivated area; bajra and cotton are the next most extensively grown crops: among other crops are sugar-cane and opium. The commercial importance of the district depends almost entirely upon its connection with the Salt range, salt being found throughout these hills. The revenue derived from this product, however, though collected in the Shahpur district, cannot properly be credited to it, as the mineral, though abundant in the Shahpur portion of the range, is worked chiefly in that part of it which lies in the Jhelum district. The chief exports are grain, rice, cotton, wool, *ghi,* and saltpetre; the imports sugar, English piece-goods, and metals. Its manufactures consist of silk and cotton scarfs, toys, and felt and blankets. The gross revenue in 1883-84 amounted to £55,290 [$268,709.40], of which the land contributed £39,020 [$189,637.20].

Shahpur passed into the hands of the English along with the rest of the Punjab on the suppression of the Múltan rebellion in 1849. During the mutiny of 1857 the district remained tranquil, and though the villages of the *bar* gave cause for alarm no outbreak of sepoys occurred. Since annexation the limits and constitution of the district have undergone many changes.

SHAHRASTÁNÍ (1086–1153). Abu'l-Fath Mohammed ibn 'Abd al-Karím, called al-Shahrastání, a native of Shahrastán (Shehristán) in Khorásán, Persia, was noted as a jurisconsult and theologian of the Ash'arite school. He went to Baghdad in 1116 and stayed there three years, but afterwards returned to his native place, where he died. Sam'ání, the famous historian of Baghdad, was one of his hearers, and to him Ibn Khallikán (No. 622, Eng. tr. ii. 675 *sq.*) mainly owes the little that is known of Shahrastání's life.

He wrote various works, of which several still exist; that which gives him a claim to notice here is the interesting *Kitáb al-Milal wan-Nihal,* or "Account of Religious Sects and Philosophical Schools," published by Cureton in 1846 and translated into German by Haarbrücker (Halle, 1850-51). The book was already used by Pocock for his account of the ancient Arabs and has been much referred to since, but has to be read with caution, as the author is often very uncritical. It treats successively of the Mohammedan sects, of other religious bodies (Jews, Samaritans, Christians, Magians, Manichæans, etc.), of philosophical schools (including the Greeks), and of the ancient Arabs and Indians, and contains a great deal of curious and valuable matter.

SHAIRP, JOHN CAMPBELL (1819–1885), principal of the United College, St. Andrews, and professor of poetry at Oxford, was born at Houstoun House, Linlithgowshire, on July 30, 1819. He was the third son of Major Norman Shairp of Houstoun and E. Binning, daughter of J. Campbell of Kildaloig, Argyllshire. He was educated at Edinburgh Academy and Glasgow University, where he gained the Snell exhibition, and entered at Balliol College, Oxford, in 1840. While a student at Glasgow and an undergraduate at Oxford it was his privilege to make many warm friends and to be very widely loved. At Glasgow began his lifelong friendship with Dr. Norman M'Leod, while among those with whom he was most intimate at Oxford were the names of Bradley, Coleridge, Temple, Clough, Walrond, Riddell, Prichard, and Edwin Palmer. In 1842 he gained the Newdigate prize for a poem on Charles XII., and in 1844 took his degree with second class honors. During these years the "Oxford movement" was at its height. Shairp's earnest nature was greatly stirred by Newman's sermons, while Keble's poetry spoke home to his heart; but, though full of warm sympathy for many High Church views, he remained faithful to his Presbyterian upbringing. After leaving Oxford he took a mastership at Rugby under Dr. Tait; here he sought loyally to develop Dr. Arnold's system by appealing to the better feelings of his pupils and by giving them wide views of culture and education. And in this he was successful, making among his pupils warm and lasting friends. In 1857 he became assistant to the professor of humanity in the university of St. Andrews, and in 1861 he was appointed professor of that chair. In 1853 he married Eliza, daughter of Henry Alexander Douglas, Kilhead, Dumfriesshire, and had one surviving son, John Campbell, who became an advocate at the Scottish bar. Shairp was highly respected by the more earnest students, and much loved by some whose spiritual as well as mental nature he helped to quicken. In 1864 he published *Kilmahoe, a Highland Pastoral;* in this his devotion to the scenery and the people of the Scottish Highlands, where he always spent his vacations, found vent. In this poem there was a directness, simplicity, and moral earnestness which showed the true poet. In 1868 he republished some articles under the name of *Studies in Poetry and Philosophy;* this book showed him to be one of the foremost critics of his day; the chief subjects it discussed were Wordsworth, Coleridge, and Keble. He insisted strongly on the high spiritual teaching and the deep poetical power of the great lake bard. While not blind to his many faults of style, his occasional puerility, and his prosiness, he urged his claims as a unique interpreter of Nature and a spiritual philosopher. Coleridge interested him as a poet, but much more as a religious teacher; the *Aids to Reflection* was a favorite present to his young friends, and often gave a text for his deeper conversations. The most popular essay was that on Keble, in which he gave a vivid sketch of Newman's influence in Oxford, while he spoke of the author of *The Christian Year* with enthusiasm as a Christian teacher, and with discerning criticism as a poet. In 1868 he was presented to the principalship of the United College, vacant by the death of J. D. Forbes; he discharged the duties of this office with conscientious zeal and interest, and also continued to lecture from time to time on literary and ethical subjects. A course of the lectures, published in 1870, *Culture and Religion,* is one of his most popular works. In 1873 he helped to edit the life of Principal Forbes, and in 1874 he edited Dorothy Wordsworth's charming *Recollections of a Tour in Scotland in* 1803. In 1877 he was elected professor of poetry at Oxford in succession to Sir F. H. Doyle. Of his lectures from this chair the best were published in 1880 as *Aspects of Poetry.* In 1877 he had published *The Poetic Interpretation of Nature,* in which he enters fully into the "old quarrel," as Plato calls it, between science and poetry, and traces with great clearness and literary acumen the ideas of nature in all the chief Hebrew, classical, and English poets. In 1879 he published a short life of Robert Burns. Such were Shairp's chief literary works, though many uncollected magazine articles and a few poems show the versatility of his mind; attention may be specially called to his article KEBLE in this *Encyclopædia* as an example of his critical power. In 1882 he was re-

elected to the poetry chair and discharged his duties there and at St. Andrews till the end of 1884; but his health had been frail for some time, and in March, 1885, he sought a change of air in the Riviera. He returned in June somewhat benefited, but he caught a chill in the autumn, and, after a short illness, died at Ormsary, Argyllshire, on September 18, 1885.

SHAKERS is the name commonly applied to and not rejected by a religious denomination of which the official title is "The United Society of Believers in Christ's Second Appearing." The foundress was Ann Lee, who was born in Toad Lane, Manchester, 29th February, 1736, but only privately baptized 1st June, 1742. Her father was a blacksmith, and at an early age she found employment, being at one time a cutter of hatter's fur, and at another cook in the infirmary of her native town. She was a quiet child of a somewhat visionary temperament, and in 1758 joined a small religious body, a remnant of the French Prophets. The leader was Jane Wardley, who was regarded by her followers as the "spirit of John the Baptist operating in the female line." These people were called Shakers because, like the early Quakers, they were seized with violent tremblings and shakings when under the influence of strong religious emotion. Ann Lee in 1762 married a blacksmith whose character was not very good. Their four children died in infancy. She became "a seeker after salvation," and her conversion was followed by her taking the lead in the Shaker Society, to which she promulgated a doctrine of celibacy. Their previous training had led them to expect that the second coming of Christ would be in the form of a woman; as Eve was the mother of all living, so in their new leader the Shakers recognized "the first mother or spiritual parent in the line of the female." With their new-born zeal aflame, they preached their doctrine in season and out of season, and suffered something from mob violence and from the intolerance of the constituted authorities. In 1774 Ann the Word and eight of her disciples emigrated to America, and landed at New York on August 6th of that year. Abraham Stanley, not relishing his wife's celibate creed, abandoned her for another woman. The "Believers" settled at Niskayuna, now called Watervliet, and were imprisoned for refusing to take the oath, for which reason they were suspected of being unfavorable to the cause of the Revolution. On being released they preached their creed and gradually gained converts. Ann Lee died at Watervliet, 8th September, 1780.[1] She was succeeded by James Whittaker, who died in 1788, when Joseph Meacham succeeded to the leadership and organized the society on that communistic basis which now distinguishes it. In the early history of the Shakers various charges were brought against them, including flagellation and naked dancing, but they have outlived these scandals and are now generally respected. There is an interesting sketch of a Shaker community in Howells's *Undiscovered Country*. They all work; they are capital agriculturists; they have a widespread reputation for thoroughness, frugality, and temperance. They believe in the reality of constant intercourse with the world of spirits. There are "poems" by Mother Ann which it is claimed have been dictated by her from the spirit world. They claim from time to time the exercise of the gift of tongues and the gift of healing. The theological ideas of the Shakers are set forth in the *Testimony of Christ's Second Appearing exemplified by the Principle and Practice of the True Church of Christ*, of which a fourth edition, printed in 1856, was extensively circulated. A compacter statement is that in F. W. Evans's *Shakers' Compendium*, which was printed at New Lebanon in 1859. Elder Evans, who is the best-known representative of Shakerism, is of English birth, and has published an autobiography. In 1870 there were eighteen distinct Shaker communities, with eighteen church buildings capable of seating 8850 persons, and possessing property valued at $86,900.[2] These socialist villages are in Connecticut, Kentucky, Maine, Massachusetts, New York, New Hampshire, and Ohio.

The best known of the settlements is that at New Lebanon, where there are three separate societies in view of each other. The North Family, the Church Family, and the Second Family are distinct groups, whose members live together and have a common right to land, house, hats, tools, books, and all that there is. The only form of government is that supplied by the public opinion of the community, as expressed in its social meetings for mutual confession, counsel, and criticism. Mr. Hepworth Dixon's *New America* gives an interesting account of their communistic methods.[3]

There is an extensive literature respecting the Shakers: a bibliography is appended to W. E. A. Axon's *Biographical Notice of Ann Lee*, Liverpool, 1876.

SHAKESPEARE.

WILLIAM SHAKESPEARE (1564–1616), the national poet of England, the greatest dramatist that modern Europe has produced, was born in April, in the year 1564, at Stratford-upon-Avon, in the county of Warwick. The known facts of the poet's personal history are comparatively few, and before giving them in order we purpose considering in some detail the larger educational influences which helped to stimulate his latent powers, to evoke and strengthen his poetical and patriotic sympathies, and thus prepare and qualify him for his future work. In dealing with these influences we are on firm and fruitful ground. We know, for example, that Shakespeare was born and lived for twenty years at Stratford-upon-Avon; and we can say therefore with certainty that all the physical and moral influences of that picturesque and richly-storied Midland district melted as years went by into the full current of his ardent blood, became indeed the vital element, the very breath of life his expanding spirit breathed. We know a good deal about his home, his parents, and his domestic surroundings; and these powerful factors in the development of any mind gifted with insight and sensibility must have acted with redoubled force on a nature so richly and harmoniously endowed as that of the Stratford poet. It would be difficult indeed to overestimate the combined effect of these vital elements on his capacious and retentive mind, a mind in which the receptive and creative powers were so equally poised and of such unrivalled strength. This review of the larger influences operating with concentrated force during the critical years of youth and early manhood will help to connect and interpret the few and scattered particulars of

[1] [Died in 1784. See F. W. Evans's *Shakers' Compendium* (1859). —AM. ED.]

[2] [This estimate is too small. They own about 50,000 acres of highly improved land. At New Lebanon there are seven separate families in neighborhood. See Nordhoff's *Communistic Societies of the U. S.*—AM. ED.]

[3] There is considerable similarity between the American disciples of Ann Lee and the English Shakers of the New Forest, who came into public notice in 1871. One of their members had bought 31 acres of land, which they cultivated under the direction of "Mother" Mary Ann Girling, who was at once their foundress and prophetess. As the result of some litigation the Shakers were ejected in 1874, and, after having shelter for a time on a farm belonging to the Hon. Auberon Herbert, they then became a tent community. Charges were made against them of naked dancing in the course of their religious ecstasies. They believe in the second advent, regard Mrs. Girling as the woman Messiah, have all property in common, and preach the doctrine of celibacy.

Shakespeare's personal history. These particulars must indeed be to some extent connected and interpreted in order to be clearly understood, and any intelligible account of Shakespeare's life must therefore take the shape of a biographical essay, rather than of a biography proper. We may add that the sketch will be confined to the points connected with Shakespeare's local surroundings and personal history. The large literary questions connected with his works, such as the classification, the chronology, and analysis of the plays, could not of course be adequately dealt with in such a sketch. It is the less necessary that this wider task should be attempted as the main points it embraces have recently been well handled by competent Shakespearian scholars. The best and most convenient manuals embodying the results of recent criticism and research will be referred to at the close of the article. Meanwhile we have first to look at the locality of Shakespeare's birth, both in its material and moral aspects.

Warwickshire.

Warwickshire was known to Shakespeare's contemporaries as the central county or heart of England. It was the middle shire of the Midlands, where the two great Roman roads crossing the island from east to west and west to east met,—forming at their point of junction the centre of an irregular St. Andrew's cross, of which the arms extended from Dover to Chester on the one side and from Totnes to Lincoln and the north on the other. The centre in which these roads—Watling Street and the Fosse Way—thus met was early known from this circumstance as the High Cross. Being the most important Midland position during the Roman occupation of the country, several Roman stations were formed in the neighborhood of this venerable Quatre Bras. Of these Camden specifies the ancient and flourishing city of Clychester, represented in part by the modern Clybrook, and Manduessidum, the memory of which is probably retained in the modern Mancettar. Important Roman remains have also been found within a few miles of Stratford, at Alcester, a central station on the third great Roman road, Ricknild Street, which runs from south to north across the western side of the county. In later times, when means of communication were multiplied, the great roads to the northwest still passed through the county, one of them, the mail road from London through Oxford to Birmingham, Stafford, and Chester, was the "streete" or public way that crossed the Avon at the celebrated ford, spanned in 1483 by Sir Hugh Clopton's magnificent bridge of fourteen arches. Immediately beyond the bridge rose the homely gables and wide thoroughfares of Shakespeare's native place.

The Arden division.

In Shakespeare's time Warwickshire was divided by the irregular line of the Avon into two unequal but well-marked divisions, known respectively, from their main characteristics, as the woodland and the open country, or more technically as the districts of Arden and Feldon. The former included the thickly-wooded region north of the Avon, of which the celebrated forest of Arden was the centre, and the latter the champaign country, the rich and fertile pasture-lands between the Avon and the line of hills separating Warwick from the shires of Oxford and Northampton. Shakespeare himself was of course familiar with this division of his native shire, and he has well expressed it in Lear's description of the section of the kingdom assigned to his eldest daughter Goneril:

> "Of all these bounds,—even from this line to this,
> With shadowy forests and with champaigns rich'd,
> With plenteous rivers and wide-skirted meads,—
> We make thee lady."

No better general description of Warwickshire could indeed be given than is contained in these lines. Taking the Roman roads, Watling and Ricknild Streets, as boundaries, they vividly depict the characteristic features of the county, including its plenteous rivers and wide-skirted meads. The old and central division of Arden and Feldon is clearly embodied in the second line, "with shadowy forests and with champaigns rich'd." This distinction, practically effaced in modern times by agricultural and mining progress, was partially affected by these causes even in Shakespeare's own day. The wide Arden, or belt of forest territory which had once extended not only across the county but from the Trent to the Severn, was then very much restricted to the centre of the shire, the line of low hills and undulating country which stretched away for upwards of twenty miles to the north of Stratford. The whole of the northern district was, it is true, still densely wooded, but the intervening patches of arable and pasture land gradually encroached more and more upon the bracken and brushwood, and every year larger areas were cleared and prepared for tillage by the axe and the plough. In the second half of the 16th century, however, the Arden district still retained enough of its primitive character to fill the poet's imagination with the exhilarating breadth and sweetness of woodland haunts, the beauty, variety, and freedom of sylvan life, and thus to impart to the scenery of *As You Like It* the vivid freshness and reality of a living experience. In this delightful comedy the details of forest-life are touched with so light but at the same time so sure a hand as to prove the writer's familiarity with the whole art of venery, his thorough knowledge of that "highest franchise of noble and princely pleasure" which the royal demesnes of wood and park afforded. In referring to the marches or wide margins on the outskirts of the forest, legally known as purlieus, Shakespeare indeed displays a minute technical accuracy which would seem to indicate that in his early rambles about the forest and casual talks with its keepers and woodmen he had picked up the legal incidents of sylvan economy, as well as enjoyed the freedom and charm of forest-life. Throughout the purlieus, for instance, the forest laws were only partially in force, while the more important rights of individual owners were fully recognized and established. Hence it happened that Corin's master, dwelling, as Rosalind puts it in a quaint but characteristic simile that betrays her sex, "here in the skirts of the forest, like fringe upon a petticoat," could sell "his cote, his flock, and bounds of feed," and that Celia and Rosalind were able to purchase "the cottage, the pasture, and the flock." It may be noted, too, that, in exchange for the independence the dwellers in the purlieus acquired as private owners, they had to relinquish their common right or customary privilege of pasturing their cattle in the forest. Sheep, indeed, were not usually included in this right of common, their presence in the forest being regarded as inimical to the deer. When kept in the purlieus, therefore, they had to be strictly limited to their bounds of feed, shepherded during the day and carefully folded every night, and these points are faithfully reflected by Shakespeare. Again, only those specially privileged could hunt venison within the forest. But if the deer strayed beyond the forest bounds they could be freely followed by the dwellers in the purlieus, and these happy hunting grounds outside the forest precincts were in many cases spacious and extensive. The special office of a forest ranger was indeed to drive back the deer straying in the purlieus. The banished duke evidently has this in mind when, as a casual denizen of the forest, he proposes to make war on its native citizens:

> "Come, shall we go and kill us venison?
> And yet it irks me, the poor dappled fools,
> Being native burghers of this desert city,
> Should, in their own confines, with forked heads,
> Have their round haunches gor'd."

And the melancholy Jaques, refining as usual with cynical sentimentalism on every way of life and every kind of action, thinks it would be a special outrage

> "To fright the animals, and to kill them up,
> In their assign'd and native dwelling place."

Not only in *As You Like It*, but in *Love's Labor's Lost*, in *A Midsummer Night's Dream*, in the *Merry Wives of Windsor*, and indeed throughout his dramatic works, Shakespeare displays the most intimate knowledge of the aspects and incidents of forest life; and it is certain that in the first instance this knowledge must have been gained from his early familiarity with the Arden district. This, as we have seen, stretched to the north of Stratford in all its amplitude and variety of hill and dale, leafy covert and sunny glade, giant oaks and tangled thickets,—the woodland stillness being broken at intervals not only by the noise of brawling brooks below and of feathered outeries and flutterings overhead, but by dappled herds sweeping across the open lawns or twinkling in the shadowy bracken, as well as by scattered groups of timid conies feeding, at matins and vespers, on the tender shoots and sweet herbage of the forest side. The deer-stealing tradition is sufficient evidence of the popular belief in the poet's love of daring exploits in the regions of vert and venison, and of his devotion, although in a somewhat irregular way perhaps, to the attractive woodcraft of the park, the warren, and the chase. The traditional scene of this adventure was Charlecote Park, a few miles northeast of Stratford: but the poet's early wanderings in Arden extended, no doubt, much further afield. Stirred by the natural desire of visiting at leisure the more celebrated places of his native district, he would pass from Stratford to Henley and Hampton, to Wroxall Priory and Kenilworth Castle, to Stoneleigh Abbey and Leamington Priors, to Warwick Keep and Guy's Cliffe. The remarkable beauty of this last storied spot stirs the learned and tranquil pens of the antiquaries Camden and Dugdale to an unwonted effort of description, even in the pre-descriptive era. "Under this hill," says Camden, "hard by the river Avon, standeth Guy-cliffe, others call it Gib-cliffe, the dwelling house at this day of Sir Thomas Beau-foe, descended from the ancient Normans line, and the very seate itselfe of pleasantnesse. There have yee a shady little wood, cleere and cristall springs, mossy bottomes and caves, medowes alwaies fresh and greene, the river rumbling here and there among the stones with his stream making a milde noise and gentle whispering, and besides all this, solitary and still quietnesse, things most grateful to the Muses." But the whole of the circuit was richly wooded, the towns, as the names indicate, being forest towns,—Henley-in-Arden, Hampton-in-Arden,—while the castles and secularized religious houses were paled off within their own parks and bounds from the sylvan wilderness around them. Some, like the celebrated castle of the Mountfords, called from its pleasant situation amongst the woods Beaudesert, having been dismantled during the Wars of the Roses were already abandoned, and had in Shakespeare's day relapsed from the stately revelry that once filled their halls into the silence of the surrounding woods. At every point of the journey, indeed, as the poet's eager and meditative eye embraced new vistas, it might be said,

> "Towers and battlements it sees
> Bosomed high in tufted trees."

On the southern margin of the Arden division, towards the Avon, small farms were indeed already numerous, and cultivation had become tolerably general. But the region as a whole still retained its distinctive character as the Arden or wooded division of the county. Even now, indeed, it includes probably more woods and parks than are to be found over the same area in any other English shire.

The Feldon division.

While parks of the Arden district were in this way under cultivation, it must not be supposed that the champaign or open country to the south of the Avon, the Feldon division of the county, was destitute of wood; on the contrary its extensive pastures were not only well watered by local streams overshadowed by willow and alder, but well wooded at intervals by groups of more stately trees. The numerous flocks and herds that grazed throughout the valley of the Red Horse found welcome shelter from the noonday heat and the driving wind under the green roofs and leafy screens that lined and dotted their bounds of feed. And, although even the grazing farms were comparatively small, almost every homestead had its group of protecting elms, its outlying patch of hanging beech and ash, or straggling copse of oak and hazel. This is still reflected in such local names as Wood Park, Shrub Lands, Ockley Wood, Furze Hill, Oakham, Ashborne, Alcott Wood, Berecote Wood, and Radland Gorse. These features gave interest and variety to the Feldon district, and justified the characteristic epithet which for centuries was popularly applied to the county as a whole, that of "woody Warwickshire." And Shakespeare, in passing out of the county on his London journeys, would quickly feel the difference, as beyond its borders he came upon stretches of less clothed and cultivated scenery. As his stout gelding mounted Edgehill, and he turned in the saddle to take a parting look at the familiar landscape he was leaving, he would behold what Speed, in his enthusiasm, calls "another Eden, as Lot the plain of Jordan." While the general aspect would be that of green pastures and grassy levels, there would be at the same time the picturesque intermingling of wood and water, of mill and grange and manor house, which gives light and shade, color and movement, interest and animation, to the plainer sweeps and more monotonous objects of pastoral scenery.

History.

On the historical side Warwickshire has points of interest as striking and distinctive as its physical features. During the Roman occupation of the country it was, as we have seen, the site of several central Roman stations, of which, besides those already noticed, the fortified camps of Tripontium and Præsidium on the line of the Avon were the most important. A Roman road crossed the Avon at Stratford, and radiating north and south soon reached some of the larger Roman towns of the west, such as Uriconium and Corinium. Between these towns were country villas or mansions, many of them being, like that at Woodchester, "magnificent palaces covering as much ground as a whole town." The entire district must in this way have been powerfully affected by the higher forms of social life and material splendor which the wealthier provincials had introduced. The immediate effect of this Roman influence on the native populations was, as we know, to divide them into opposed groups whose conflicts helped directly to produce the disastrous results which followed the withdrawal of the Romans from the island. But the more permanent and more important effect is probably to be traced in the far less obstinate resistance offered by the Celtic tribes of Mid Britain to the invading Angles from the north and Saxons from the south, by whom themselves and their district were eventually absorbed. Instead of the fierce conflicts and wrathful withdrawal or extermination of the conquered Britons which prevailed further east, and a for a time perhaps further west also, the intervening tribes appear to have accepted the overlordship of their Teutonic neighbors and united with them in the cultivation and defence of their common territory. The fact that no record of any early Angle conquest remains seems to indicate that, after at most a brief resistance, there was a gradual coalescence of the invading with the native tribes rather than any fierce or memorable struggle between them. Even the more independent and warlike tribes about the Severn repeatedly joined the Saxon Hwiccas, whose northern frontier was the forest of Arden, in resisting the advance of Wessex from the south. And for more than a hundred years after the establishment of the central kingdom of the Angles, the neighboring Welsh princes

Early union of Celtic and Teutonic races.

are found acting in friendly alliance with the Mercian rulers. It was thus the very district where from an early period the two race elements that have gone to the making of the nation were most nearly balanced and most completely blended. The union of a strong Celtic element with the dominant Angles is still reflected in the local nomenclature, not only in the names of the chief natural features, such as rivers and heights, —Arden and Avon, Lickey, Alne, and Thame,—but in the numerous *combes* and *cotes* or *cots*, as in the reduplicative Cotswold, in the *duns*, *dons*, and *dens*, and in such distinctively Celtic elements as *man*, *pol*, *try*, in names of places scattered through the district. The *cotes* are, it is true, ambiguous, being in a majority of cases perhaps Saxon rather than Celtic, but in a forest country near the old Welsh marches many must still represent the Celtic *coet* or *coed*, and in some cases this is clear from the word itself, as in Kingscot, a variation of Kingswood, and even Charlecote exists in the alternative form of Charlewood. This union of the two races, combined with the stirring conditions of life in a wild and picturesque border country, gave a vigorous impulse and distinctive character to the population, the influence of which may be clearly traced in the subsequent literary as well as in the political history of the country. As early as the 9th century, when the ravages of the Danes had desolated the homes and scattered the representatives of learning in Wessex, it was to western Mercia that King Alfred sent for scholars and churchmen to unite with him in helping to restore the fallen fortunes of religion and letters. And after the long blank in the native literature produced by the Norman Conquest the authentic signs of its indestructible vitality first appeared on the banks of the Severn. Layamon's spirited poem dealing with the legendary history of Britain, and written at Redstone near Arley, within sight of the river's majestic sweep amidst its bordering woods and hills, is by far the most important literary monument of semi-Saxon. And, while the poem as a whole displays a Saxon tenacity of purpose in working out a comprehensive scheme of memorial verse, its more original parts have touches of passion and picturesqueness, as well as of dramatic vivacity, that recall the patriotic fire of the Celtic bards. A hundred and fifty years later the first great period of English literature was inaugurated by another poem of marked originality and power, written under the shadow of the Malvern Hills. The writer of the striking series of allegories known as *Piers Plowman's Visions* was a Shropshire man, and, notwithstanding his occasional visits to London and official employments there, appears to have spent his best and most productive years on the western border between the Severn and the Malvern Hills. In many points both of substance and form the poem may, it is true, be described as almost typically Saxon. But it has at the same time a power of vivid portraiture, a sense of color, with an intense and penetrating if not exaggerated feeling for local grievances which are probably due to the strain of Celtic blood in the writer's veins. Two centuries later, from the same district, from a small town on an affluent of the Severn, a few miles to the west of the river, came the national poet, who not only inherited the patriotic fire and keen sensibility of Layamon and Langland, but who combined in the most perfect form and carried to the highest point of development the best qualities of the two great races represented in the blood and history of the English nation. Mr. J. R. Green, in referring to the moral effects arising from the mixture of races in the Midland district, has noted this fact in one of those sagacious side-glances that make his history so instructive. "It is not without significance," he says, "that the highest type of the race, the one Englishman who has combined in their largest measure the mobility and fancy of the Celt with the depth and energy of the Teutonic temper, was born on the old Welsh and English borderland, in the forest of Arden." And from the purely critical side Mr. Matthew Arnold has clearly brought out the same point. He traces some of the finest qualities of Shakespeare's poetry to the Celtic spirit which touched his imagination as with an enchanter's wand, and thus helped to brighten and enrich the profounder elements of his creative genius.

The history of Warwickshire in Anglo-Saxon times is identified with the kingdom of Mercia, which, under a series of able rulers, was for a time the dominant power of the country. In later times, from its central position, the county was liable to be crossed by military forces if rebellion made head in the north or west, as well as to be traversed and occupied by the rival armies during the periods of civil war. The most important events, indeed, connected with the shire before Shakespeare's time occurred during the two greatest civil conflicts in the earlier national annals—the Barons' War in the 13th century, and the Wars of the Roses in the 15th. The decisive battles that closed these long and bitter struggles, and thus became turning points in our constitutional history, were both fought on the borders of Warwickshire,—the battle of Evesham on the south-western and the battle of Bosworth Field on the north-eastern boundary. The great leaders in each conflict—the founder of the Commons House of Parliament and the "setter up and puller down of kings"—were directly connected with Warwickshire. Kenilworth belonged to Simon de Montfort, and its siege and surrender constituted the last act in the Barons' War. During the Wars of the Roses the county was naturally prominent in public affairs, as its local earl, the last and greatest of the lawless, prodigal, and ambitious barons of mediæval times, was for more than twenty years the leading figure in the struggle. But notwithstanding this powerful influence the county was, like the country itself, very much divided in its political sympathies and activities. The weakness and vacillation of Henry VI. had stimulated the rival house of York to assert its claims, and, as the trading and mercantile classes were always in favor of a strong government, London, with the eastern counties and the chief ports and commercial towns, favored the house of York. On the other hand, South Wales, some of the Midland and most of the western shires, under the leadership of the Beauforts, and the northern counties, under the leadership of Clifford and Northumberland, supported the house of Lancaster. Political feeling in the Principality itself was a good deal divided. The duke of York still possessed Ludlow Castle, and, the Welsh of the northern border being devoted to the houses of March and Mortimer, Prince Edward, the young earl of March, after the defeat and death of his father at Wakefield, was able to rally on the border a "mighty power of marchmen," and, after uniting his forces with those of Warwick, to secure the decisive victory of Towton which placed him securely on the throne. Still, during the earlier stages of the struggle the Beauforts, with the earls of Pembroke, Devon, and Wiltshire, were able to muster in the south and west forces sufficient to keep the Yorkists in check. And when the final struggle came,—when Henry of Richmond landed at Milford Haven,—the Welsh blood in his veins rallied to his standard so powerful a contingent of the southern marchmen that he was able at once to cross the Severn, and, traversing north Warwickshire, to confront the forces of Richard, with the assurance that in the hour of need he would be supported by Stanley and Northumberland. Warwickshire itself was, as already intimated, considerably divided even in the more active stages of the conflict, Coventry being strongly in favor of the Red Rose, while Warwick, under the influence of the earl, was for a while devoted to the cause of the White Rose. Kenilworth was still held by the house of Lancaster, and Henry VI. at the outset of the conquest had more than once taken refuge there. On the other hand Edward IV. and Richard III. both visited Warwick, the latter being so interested in the castle that he is said to have laid the foundation of a new and "mighty fayre" tower on the north side, afterwards known as the Bear's Tower. Edward IV., in harmony with his strong instinct for popularity, and command of the arts that secure it, tried to conciliate the people of Coventry by visiting the town and witnessing its celebrated pageants more than once—at Christmas in 1465 and at the festival of St. George in 1474. Although he was accompanied by his queen the efforts to win the town from its attachment to the rival house do not appear to have been very successful. Under Edward's rule the manifestation of active partisanship was naturally in abeyance, and no doubt the feeling may to some extent have declined. Indeed, in the later stages of the struggle Warwickshire, like so many other counties, was comparatively weary and quiescent. When

Wars of the Roses.

Richard III. advanced to the north the sheriff of the shire had, it is true, in obedience to the royal mandate levied a force on behalf of the king, but as this force never actually joined the royal standard it is naturally assumed that it was either intercepted by Henry on his march to Bosworth Field or had voluntarily joined him on the eve of the battle. In view of the strong Lancasterian sympathies in the north and east of the shire the latter is by far the more probable supposition. In this case, or indeed on either alternative, it may be true, as asserted in the patent of arms subsequently granted to Shakespeare's father, that his ancestors had fought on behalf of Henry VII. in the great battle that placed the crown on his head. Many families bearing the name of Shakespeare were scattered through Warwickshire in the 15th century, and it is therefore not at all unlikely that some of their members had wielded a spear with effect in the battle that, to the immense relief of the country, happily closed the most miserable civil conflict in its annals.

Influence of local traditions.

But, whether any of his ancestors fought at Bosworth Field or not, Shakespeare would be sure in his youth to hear, almost at first hand, a multitude of exciting stories and stirring incidents connected with so memorable and far-reaching a victory. After the battle Henry VII. had slept at Coventry, and was entertained by the citizens and presented with handsome gifts. He seems there also to have first exercised his royal power by conferring knighthood on the mayor of the town. The battle was fought only eighty years before Shakespeare's birth, and public events of importance are vividly transmitted by local tradition for more than double that length of time. At this hour the quiet farmsteads of Mid Somerset abound with stories and traditions of Monmouth and his soldiers, and of the events that preceded and followed the battle of Sedgemoor. And a century earlier local traditions possessed still more vitality and power. In the 16th century, indeed, the great events of the nation's life, as well as more important local incidents, were popularly preserved and transmitted by means of oral tradition and scenic display. Only a small and cultured class could acquire their knowledge of them through literary chronicles and learned records. The popular mind was of necessity largely fed and stimulated by the spoken narratives of the rustic festival and the winter fireside. And a quiet settled neighborhood like Stratford, out of the crush, but near the great centres of national activity, would be peculiarly rich in these stored-up materials of unwritten history. The very fact that within eight miles of Shakespeare's birthplace arose from their cedared slopes the halls and towers of the great earl who for more than a quarter of a century wielded a political and military power mightier than any subject had wielded before would give the district an exceptional prominence in the national annals, which would be locally reflected in an answering wealth of historic tradition. In Shakespeare's day Warwickshire thus supplied the materials of a liberal elementary training in the heroic annals of the past, and especially in the great events of the recent past that had established the Tudors on the throne, consolidated the permanent interests of the Government and the country, and helped directly to promote the growing unity and strength, prosperity and renown, of the kingdom. The special value of Shakespeare's dramatic interpretation of this period, arising from his early familiarity with the rich and pregnant materials of unwritten history, has recently been insisted on afresh by one of our most careful and learned authorities. In the preface to his work on *The Houses of Lancaster and York*, Mr. James Gairdner says: "For this period of English history we are fortunate in possessing an unrivalled interpreter in our great dramatic poet Shakespeare. A regular sequence of historical plays exhibits to us, not only the general character of each successive reign, but nearly the whole chain of leading events from the days of Richard II. to the death of Richard III. at Bosworth. Following the guidance of such a master mind, we realize for ourselves the men and actions of the period in a way we cannot do in any other epoch. And this is the more important as the age itself, especially towards the close, is one of the most obscure in English history. During the period of the Wars of the Roses we have, comparatively speaking, very few contemporary narratives of what took place, and anything like a general history of the times was not written till a much later date. But the doings of that stormy age,—the sad calamities endured by kings—the sudden changes of fortune in great men—the glitter of chivalry and the horrors of civil war,—all left a deep impression upon the mind of the nation, which *was kept alive by vivid traditions of the past at the time that our great dramatist wrote.* Hence, notwithstanding the scantiness of records and the meagreness of ancient chronicles, we have singularly little difficulty in understanding the spirit and character of the times." Familiar as he must have been in his youth with the materials that enabled him to interpret so stirring a period, it is not surprising that even amidst the quiet hedgerows and meadows of Stratford Shakespeare's pulse should have beat high with patriotic enthusiasm, or that when launched on his new career in the metropolis he should have sympathized to the full extent of his larger powers with the glow of loyal feeling that, under Elizabeth's rule, and especially in the conflict with Spain, thrilled the nation's heart with an exulting sense of full political life, realized national power, and gathering European fame.

In the interval that elapsed between the battle of Bosworth Field and the birth of Shakespeare Warwickshire continued to be visited by the reigning monarch and members of the royal family. The year after his accession to the crown Henry VIII., with Queen Catherine, visited Coventry in state, and witnessed there a series of magnificent pageants. In 1525 the Princess Mary spent two days at the priory, being entertained with the usual sports and shows, and presented by the citizens on her departure with handsome presents. The year after Shakespeare's birth Queen Elizabeth made a state visit to Coventry, Kenilworth, and Warwick, the young queen being received at every point of her progress with unusually splendid demonstrations of loyalty and devotion. And eleven years before Shakespeare's birth King Edward VI., in the last months of his reign, had specially interested himself in the reëstablishment by royal charter of the free grammar school of the guild at Stratford, which had been suppressed at the dissolution of religious houses during his father's reign.

Stratford.

The town of Stratford lies on the north bank of the Avon, at a point about midway in its course from its rise in Northamptonshire hills to its junction with the Severn at Tewkesbury. On entering the town, across Sir Hugh Clopton's noble bridge, the road from the southeast fans out in three main directions,—on the right to Warwick and Coventry, on the left to Alcester, while between runs the central street, the modern representative of the old Roman way to Birmingham, Chester, and the north. Further to the left a fourth and less important road leaves the town beyond the church, and, keeping in the main the line of the river, goes to Bidford, Salford Priors, and Evesham. It is a picturesque country road, connecting a string of undulating villages and hamlets with Stratford. The town itself consisted in the 16th century of the low gable-roofed wood-and-plaster houses dotted at intervals along these roads and down the cross streets that connected them with each other and with the river. Most of the houses in Shakespeare's time had gardens at the back, and many at the sides also; and the space between the houses, combined with the unusual width of the streets, gave the town an open, cheerful look, which enabled it to retain pleasant touches of its earlier rural state. As its prosperity increased the scattered dwellings naturally tended to close up their ranks and present a more united front of exposed wares and convenient hostelries to the yeomen and graziers, who, with their wives and families, frequented the place on fair and market days. But in Shakespeare's time the irregular line of gables and porches, of penthouse walls and garden palings, with patches of flowers and overarching foliage between, still varied the view and refreshed the eye in looking down the leading thoroughfares. These thoroughfares took the shape of a central cross, of which Church, Chapel, and High Streets, running in a continuous line north and south, constituted the shaft or stem, while Bridge and Wood Streets, running in another line east and west, were the transverse beam or bar. At the point of intersection stood the High Cross, a solid stone building with steps below and open arches above, from which public proclamations were made, and, as in London and other large towns, sermons sometimes delivered. The open space around the High Cross was the centre of trade and merchandise on market days, and from the force of custom it naturally became the site on which, at a later period, the market-house was built. Opposite the High

Cross the main road, carried over Sir Hugh Clopton's arches and along Bridge Street, turns to the left through Henley Street on its way to Henley-in-Arden and the more distant northerly towns. At the western end of Wood Street was a large and open space called Rother Market, whence Rother Street, running parallel with High Street, led through narrower lanes into the Evesham Road.

The Rother Market.

This open ground was, as the name indicates, the great cattle market of Stratford, one of the most important features of its industrial history from very early times. In the later Middle Ages most of the wealthier inhabitants were engaged in farming operations, and the growth and prosperity of the place resulted from its position as a market town in the midst of an agricultural and grazing district. In the 13th century a number of charters were obtained from the early Plantagenet kings, empowering the town to hold a weekly market and no fewer than five annual fairs, four of which were mainly for cattle. In later times a series of great cattle markets, one for each month in the year, was added to the list. The name of the Stratford cattle market embodies this feature of its history, "rother" being a good Saxon word for horned cattle, a word freely employed in Early English, both alone and in composition. In the 16th century it was still in familiar use, not only in literature but in official documents, and especially in statutes of the realm. Thus Cowell, in his law dictionary, under the heading "Rother-beasts," explains that "the name comprehends oxen, cows, steers, heifers, and such like horned beasts," and refers to statutes of Elizabeth and James in support of the usage. And Arthur Golding in 1567 translates Ovid's lines:

"Mille greges illi totidemque *armenta* per herbas
Errabant—"
"A thousand flocks of sheep,
A thousand herds of *rother-beasts*, he in his fields did keep."

The word seems to have been longer retained and more freely used in the Midland counties than elsewhere, and Shakespeare himself employs it with colloquial precision in the restored line of *Timon of Athens:* "It is the pasture lards the rother's sides." Many a time, no doubt, as a boy, during the spring and summer fairs, he had risen with the sun, and, making his way from Henley Street to the bridge, watched the first arrivals of the "large-eyed kine" slowly driven in from the rich pastures of the "Red Horse Valley." There would be some variety and excitement in the spectacle as the droves of meditative oxen were invaded from time to time by groups of Herefordshire cows lowing anxiously after their skittish calves, as well as by the presence and disconcerting activity of still smaller deer. And the boy would be sure to follow the crowding cattle to the Rother Market and observe at leisure the humors of the ploughmen and drovers from the Feldon district, whose heavy intermittent talk would be in perfect keeping with the bovine stolidity of the steers and heifers around them. There was a market-cross at the head of the Rother expanse, and this was the chief gathering-place for the cattle-dealers, as the High Cross was the rallying-point of the dealers in corn and country produce. In modern Stratford Rother Market retains its place as the busiest centre at the annual fairs, during one of which it is still customary to roast an ox in the open street, often amidst a good deal of popular excitement and convivial uproar.

Chief streets and suburbs.

The cross ways going from Rother Street to the river side, which cut the central line, dividing it into three sections, are Ely Street and Sheep Street in a continuous line, and Scholar's Lane and Chapel Lane in another line. They run parallel with the head line of Bridge and Wood Streets, and like them traverse from east to west the northern shaft of the cross that constituted the ground plan of the town. Starting down this line from the market house at the top, the first division, the High Street, is now, as it was in Shakespeare's day, the busiest part for shops and shopping, the solid building at the further corner to the left being the Corn Exchange. At the first corner of the second division called Chapel Street, stands the town-hall, while at the further corner are the site and railed-in gardens of New Place, the large mansion purchased by Shakespeare in 1597. Opposite New Place, at the corner of the third and last division, known as Church Street, is the gray mass of Gothic buildings belonging to the guild of the Holy Cross, and consisting of the chapel, the hall, the grammar school, and the almshouses of the ancient guild. Turning to the left at the bottom of Church Street, you enter upon what was in Shakespeare's day a well-wooded suburb, with a few good houses scattered among the ancient elms, and surrounded by ornamental gardens and extensive private grounds. In one of these houses, with a sunny expanse of lawn and shrubbery, lived in the early years of the 17th century Shakespeare's eldest daughter Susanna with her husband, Dr. John Hall, and here in spring mornings and summer afternoons the great poet must have often strolled, either alone or accompanied by his favorite daughter, realizing to the full the quiet enjoyment of the sylvan scene and its social surroundings. This pleasant suburb, called then as now Old Town, leads directly to the church of the Holy Trinity, near the river side. The church, a fine specimen of Decorated and Perpendicular Gothic with a lofty spire, is approached on the northern side through an avenue of limes, and sheltered on the east and south by an irregular but massive group of elms towering above the churchway path between the transepts, the chancel, and the river. Below the church, on the margin of the river, were the mill, the mill-bridge, and the weir, half hidden by gray willows, green alders, and tall beds of rustling sedge. And, beyond the church, the college, and the line of streets already described, the suburbs stretched away into gardens, orchards, meadows, and cultivated fields, divided by rustic lanes with mossy banks, flowering hedgerows, and luminous vistas of bewildering beauty. These cross and country roads were dotted at intervals with cottage homesteads, isolated farms, and the small groups of both which constituted the villages and hamlets included within the wide sweep of old Stratford parish. Amongst these were the villages and hamlets of Welcombe, Ingon, Drayton, Shottery, Luddington, Little Wilmcote, and Bishopston. The town was thus girdled in the spring by daisied meadows and blossoming orchards, and enriched during the later months by the orange and gold of harvest fields and autumn foliage, mingled with the coral and purple clusters of elder, hawthorn, and mountain ash, and, around the farms and cottages, with the glow of ripening fruit for the winter's store.

Forest survivals.

But perhaps the most characteristic feature of the scenery in the neighborhood of Stratford is to be found in the union of this rich and varied cultivation with picturesque survivals of the primæval forest territory. The low hills that rise at intervals above the well-turned soil still carry on their serrated crests the lingering glories of the ancient woodland. Though the once mighty forest of Arden has disappeared, the after-glow of its sylvan beauty rests on the neighboring heights formerly enclosed within its ample margin. The traces of the forest wildness and freedom were of course far more striking and abundant in Shakespeare's day than now. At that time many of the farms had only recently been reclaimed from the forest, and most of them still had their bosky acres "of tooth'd briars, sharp furzes, pricking goss and thorns," their broom groves, hazel copses, and outlying patches of unshrubbed down. And the hills that rose above the chief villages of the neighborhood were still clothed and crowned with the green and mystic mantle of the leafy Arden. But, though much of the ancient woodland has disappeared since Shakespeare's day, many traces of it still remain. Any of the roads out of Stratford will soon bring the pedestrian to some of these picturesque survivals of the old forest wilderness. On the Warwick road, at the distance of about a mile from the town, there are on the left the Welcombe Woods, and just beyond the woods the well-known Dingles, a belt of straggling ash and hawthorn winding irregularly through blue-bell depths and briery hollows from the pathway below to the crest of the hill above, while immediately around rise the Welcombe Hills, from the top of which is obtained the finest local view of Stratford and the adjacent country. Looking southwest and facing the central line of the town, you see below you, above the mass of roofs, the square tower of the guild chapel, the graceful spire of the more distant church, the sweep of the winding river, and beyond the river the undulating valley of the Red Horse shut in by the blue range of the Costwold Hills. A couple of miles to the east of the Welcombe Hills is the village of Snitterfield, where Shakespeare's grandfather, Richard Shakespeare, lived and cultivated to the end of his days the acres around his rustic dwelling. Beyond the village

on its western side there is an upland reach of wilderness in the shape of a hill, covered with shrub and copsewood, and known as the Snitterfield Bushes. Here Shakespeare as a boy must have often rambled, enjoying the freedom of the unfenced downs, and enlarging his knowledge of nature's exuberant vitality. On the opposite side of the town, about a mile on the Evesham road, or rather between Evesham and Alcester roads, lies the hamlet of Shottery, half concealed by ancestral elms and nestling amongst its homestead fruits and flowers. From one of these homesteads Shakespeare obtained his bride, Anne Hathaway. A mile or two on the central road, passing out of the town through Henley Street, is the village of Bearley, and above the village another sweep of wooded upland known as Bearley Bushes. And at various more distant points between these roads the marl and sandstone heights, fringed with woods or covered with wilding growths, still bear eloquent testimony to the time when Guy of Warwick and his tutor in chivalry, Heraud of Arden, still roamed the forest in search of the wild ox and savage boar that frayed the infrequent travellers and devastated at intervals the slender cultivation of the district. The subtle power of this order of scenery, arising from the union of all that is rich and careful in cultivation with all that is wild and free in natural beauty, is exactly of the kind best fitted to attract and delight imaginative and emotional minds. It possesses the peculiar charm that in character arises from the union of refined culture with the bright and exhilarating spontaneity of a free and generous nature.

Moral influences of scenery.

On its moral side such scenery has an expanding illuminating power which links it to the wider and deeper interests of humanity as a whole. Nature seems to put forth her vital energies expressly for the relief of man's estate, appearing as his friend and helper and consoler. Instead of being absorbed in her own inaccessible grandeurs and solitary sublimities, she exerts her benign influences expressly as it were for his good, to cheer and brighten his evanescent days, and beautify his temporary home. Bolder and more rugged landscapes, gloomy glens, and thunder-scarred peaks may excite more passionate feelings, may rouse and strengthen by reaction the individualistic elements of mind and character, and thus produce the hardy, daring type of mountaineer, the intense self-centred and defiant local patriot or hero, the chieftain and his clansmen, *contra mundum*. No doubt it is also true that the vaster and loftier mountain ranges have a unique power of exciting in susceptible minds the emotions of awe, wonder, and sublimity. But the very power and permanence of these mighty solitudes, the grandeur and immobility of their measureless strength and imperial repose, dwarf by comparison all merely human interests; and to the meditative mind swept by the spirit of such immensities the moments of our mortal life seem to melt as dew-drops into the silence of their eternal years. The feelings thus excited, being in themselves of the essence of poetry, may indeed find expression in verse and in verse of a noble kind, but the poetry will be lyrical and reflective, not dramatic, or if dramatic in form it will be lyrical in substance. As Mr. Ruskin has pointed out, the overmastering effect of mountain scenery tends to absorb and preoccupy the mind, and thus to disturb the impartial view, the universal vision of nature and human nature as a complex whole, or rather of nature as the theatre and scene of human life, which the dramatist must preserve in order to secure success in his higher work. Mountain scenery is, however, not only rare and exacting in the range and intensity of feeling it excites, but locally remote in its separation from the interests and occupations of men. It is thus removed from the vital element in which the dramatist works, if not in its higher influence antagonistic to that element. Mr. Hamerton, who discusses the question on a wider basis of knowledge and experience than perhaps any living authority except Mr. Ruskin, supports this view. "As a general rule," he says, "I should say there is an antagonism between the love of mountains and the knowledge of mankind, that the lover of mountains will often be satisfied with their appearances of power and passion, their splendor and gloom, their seeming cheerfulness or melancholy, when a mind indifferent to this class of scenery might study the analogous phases of human character." Where, indeed, the influence of nature is overpowering, as in the East, wonder,—the wonder excited by mere physical vastness, power, and infinitude,—takes the place of intelligent interest in individual life and character.

But the dramatic poet has to deal primarily with human power and passion; and not for him therefore is the life of lonely raptures and awful delights realized by the mountain wanderer or the Alps-inspired bard. His work lies nearer the homes and ways of men, and his choicest scenery will be found in the forms of natural beauty most directly associated with their habitual activities, most completely blended with their more vivid emotional experiences. A wooded undulating country, watered by memorable streams, its ruder features relieved by the graces of cultivation, and its whole circuit rich in historical remains and associations, is outside the domain of cities, the natural stage and theatre of the dramatist and story-teller. This was the kind of scenery that fascinated Scott's imagination, amidst which he fixed his chosen home, and where he sleeps his last sleep. It is a border country of gray waving hills, divided by streams renowned in song and enriched by the monuments of the piety, splendor, and martial power of the leaders whose fierce raids and patriotic conflicts filled with romantic tale and minstrelsy the whole district from the Lammermoors to the Cheviots, and from the Leader and the Tweed to the Solway Firth. In earlier times Shakespeare's own district had been virtually a border country also. The mediæval tide of intermittent but savage warfare, between the unsubdued Welsh and the Anglo-Normans under the feudal lords of the marches, ebbed and flowed across the Severn, inundating at times the whole of Powis-land, and sweeping on to the very verge of Warwickshire. In the 12th and 13th centuries the policy of intermarriage between their own families and the Welsh princes was tried by the English monarchs, and King John, on betrothing his daughter Joan to the Welsh prince Llewelyn, gave the manor of Bidford, six miles from Stratford-on-Avon, as part of her dower. The fact of this English princess being thus identified with South Warwickshire may help to explain the prevalence of the name Joan in the county, but the early impulse towards the giving of this royal name would no doubt be strengthened by the knowledge that John of Gaunt's daughter, the mother of the great earl of Warwick, had also borne the favorite local name. Shakespeare himself it will be remembered had two sisters of this name, the elder Joan, born some time before him, the first-born of the family indeed, who died in infancy, and the younger Joan, who survived him. But the local popularity of a name, familiarly associated with the kitchen and the scullery rather than with the court or the palace, is no doubt due to one of the more striking incidents of the long conflict between the English and the Welsh on the western border. As we have seen, during the Barons' War and the Wars of the Roses the western border was the scene of active conflict, each party seeking Welsh support, and each being able in turn to rally a power of hardy marchmen to its banner. And that the insurgent Welsh were not idle during the interval between these civil conflicts we have the emphatic testimony of Glendower:

The old Welsh border.

> "Three times hath Henry Bolingbrooke made head
> Against my power: thrice from the banks of Wye
> And sedgy-bottomed Severn have I sent him
> Bootless home, and weather-beaten back."

The Hotspur and Mortimer revolt against Henry IV. well illustrates, indeed, the kind of support which English disaffection found for centuries in the Welsh marches. A rich heritage of stirring border life and heroic martial story was thus transmitted from the stormy ages of faith and feudalism to the more settled Tudor times. Apart from the border warfare there were also the multiplied associations connected with the struggles between the nobles and the crown, and the rise of the Commons as a distinctive power in the country. The whole local record of great names and signal deeds was in Shakespeare's day so far withdrawn

into the past and mellowed by secular distance as to be capable of exerting its full enchantment over the feelings and the imagination. The historical associations thus connected with the hills and streams, the abbeys and castles, of Warwickshire added elements of striking moral interest to the natural beauty of the scenery. To the penetrating imagination of poetic natures these elements reflected the continuity of national life as well as the greatness and splendor of the personalities and achievements by which it was developed from age to age. They also helped to kindle within them a genuine enthusiasm for the fortunes and the fame of their native land. And scenery beautiful in itself acquired a ten-fold charm from the power it thus possessed of bringing vividly before the mind the wide and moving panorama of the heroic past. The facts sufficiently prove that scenery endowed with this multiplied charm takes, if a calmer, still a deeper and firmer hold of the affections than any isolated and remote natural features, however beautiful and sublime, have power to do. This general truth is illustrated with even exceptional force in the lives of Scott and Shakespeare. Both were passionately attached to their native district, and the memorable scenes amidst which their early years were passed. So intense was Scott's feeling that he told Washington Irving that if he did not see the gray hills and the heather once a year he thought he should die. And one of the few traditions preserved of Shakespeare is that even in the most active period of his London career he always visited Stratford at least once every year. We know indeed from other sources that during his absence Shakespeare continued to take the liveliest interest in the affairs of his native place, and that, although London was for some years his professional residence, he never ceased to regard Stratford as his home.

Feeling of local attachment.

Amongst other illustrations of this strong feeling of local attachment that might be given there is one that has recently excited a good deal of attention and is worth noticing in some detail. Mr. Hallam, in a well-known passage, has stated that "no letter of Shakespeare's writing, no record of his conversation, has been preserved." But we certainly have at least one conversation reported at first hand, and it turns directly on the point in question. It relates to a proposal made in 1614 by some of the local proprietors for the enclosure of certain common lands at Welcombe and Old Stratford. The corporation of Stratford strongly opposed the project on the ground that it would be a hardship to the poorer members of the community, and their clerk, Mr. Thomas Greene, who was related to Shakespeare, was in London about the business in November of the same year. Under date November 17th Greene says, in notes which still exist, "My cosen Shakespear comyng yesterdy to town, I went to see him how he did. He told me that they assured him they ment to inclose no further than to Gospell Bush, and so upp straight (leavyng out part of the Dyngles to the ffield) to the gate in Clopton hedg, and take in Salisburyes peece; and that they mean in Aprill to survey the land, and then to gyve satisfaction, and not before; and he and Mr. Hall say they think ther will be nothyng done at all." This proves that the agents of the scheme had seen Shakespeare on the subject, that he had gone carefully into the details of their plan, consulted his son-in-law Dr. John Hall about them, and arrived at the conclusion that for the present they need take no decided action in the matter. There is evidently on Shakespeare's part a strong feeling against the proposed enclosure, and the agents of the scheme had clearly done their best to remove his objections, promising amongst other things that if it went forward he should suffer no pecuniary loss, a promise already confirmed by a legal instrument. But nine months later, when the local proprietors seemed bent on pushing the scheme, Shakespeare takes a more decided stand, and pronounces strongly against the whole business. We have a notice, dated September 1, 1615, to the effect that Mr. Shakespeare had on that day told the agent of the corporation "that he was not able to bear the enclosing of Welcombe." As his proprietary rights and pecuniary interests were not to be affected by the proposed enclosure, this strong expression of feeling must refer to the public advantages of the Welcombe common fields, and especially to what in Scotland would be called their "amenity," the element of value arising from their freedom and beauty, their local history and associations. Welcombe, as we have seen, was the most picturesque suburb of Stratford. The hills divided by the leafy Dingles afforded the finest panoramic view of the whole neighborhood. On their Eastern slope they led to Fulbroke Park, the probable scene of the deer-stealing adventure, and towards the northwest to the village of Snitterfield with its wooded sweep of upland "bushes." Every acre of the ground was associated with the happiest days of Shakespeare's youth. In his boyish holidays he had repeatedly crossed and recrossed the unfenced fields at the foot of Welcombe Hills on his ways to the rustic scenes and occupations of his uncle Henry's farm in the outlying forest village. He knew by heart every boundary tree and stone and bank, every pond and sheep-pool, every barn and cattle-shed, throughout the whole well-frequented circuit. And in his later years, when after the turmoil and excitement of his London life he came to reside at Stratford, and could visit at leisure the scenes of his youth, it was perfectly natural that he should shrink from the prospect of having these scenes partially destroyed and their associations broken up by the rash hand of needless innovation. In his own emphatic language, "he could not bear the enclosing of Welcombe," and the only authoritative fragment of his conversation preserved to us thus brings vividly out one of the best known and most distinctive features of his personal character and history—his deep and life-long attachment to his native place. Another illustration of the same feeling, common both to Scott and Shakespeare, is supplied by the prudence and foresight they both displayed in husbanding their early gains in order to provide, amidst the scenery they loved, a permanent home for themselves and their families. Shakespeare, the more careful and sharp-sighted of the two, ran no such risks and experienced no such reverses of fortune as those which saddened Scott's later days. Both, however, spent the last years of their lives in the home which their energy and affection had provided, and both sleep their last sleep under the changing skies and amidst the fields and streams that gave light and music to their earliest years. Hence, of all great authors, they are the two most habitually thought of in connection with their native haunts and homesteads. Even to his contemporaries Shakespeare was known as the Swan of Avon. The two spots on British ground most completely identified with the noblest energies of genius, consecrated by life-long associations, and hallowed by sacred dust are the banks of the Tweed from Abbotsford to Dryburgh Abbey, and the sweep of the Avon from Charlecote Park to Stratford church. To all lovers of literature, to all whose spirits have been touched to finer issues by its regenerating influences, these spots, and above all the abbey grave and the chancel tomb, are holy ground,—national shrines visited by pilgrims from every land, who breathe with pride and gratitude and affection the household names of Shakespeare and of Scott.

Shakespeare name and family.

The name Shakespeare is found in the Midland counties two centuries before the birth of the poet, scattered so widely that it is not easy at first sight to fix the locality of its rise or trace the lines of its progress. Several facts, however, would seem to indicate that those who first bore it entered Warwickshire from the north and west, and may therefore have migrated in early times from the neighboring marches. The name itself

is of course thoroughly English, and it is given by Camden and Verstegan as an illustration of the way in which surnames were fabricated when first introduced into England in the 13th century. But it is by no means improbable that some hardy borderers who had fought successfully in the English ranks may have received or assumed a significant and sounding designation that would help to perpetuate the memory of their martial prowess. We have indeed a distinct and authoritative assertion that some of Shakespeare's ancestors had served their country in this way. However this may be, families bearing the name are found during the 15th and 16th centuries in the Arden district, especially at Wroxhall and Rowington,—some being connected with the priory of Wroxhall, while during the 15th century the names of more than twenty are enumerated as belonging to the guild of St. Ann, at Knoll near Rowington. In the roll of this guild or college are also found the representatives of some of the best families in the county, such as the Ferrerses of Tamworth and the Clintons of Coleshill. Among the members of the guild the poet's ancestors are to be looked for, and it is not improbable, as Mr. French suggests, that John and Joan Shakespeare, entered on the Knoll register in 1527, may have been the parents of Richard Shakespeare of Snitterfield, whose sons gave each to his children the favorite family names. Richard Shakespeare, the poet's grandfather, occupied a substantial dwelling and cultivated a forest farm at Snitterfield, between 3 and 4 miles from Stratford. He was the tenant of Robert Arden, of Wilmcote, "a gentleman of worship," who farmed his own estate, situated a few miles to the west of Snitterfield. Richard Shakespeare was settled at the latter hamlet and doing well as early as 1543, Thomas Atwood of Stratford having in that year bequeathed to him four oxen which were then in his keeping; and he continued to reside there certainly till 1560, and probably till his death. He appears to have had two sons, John and Henry, of whom John, the eldest, early broke through the contracted circle of rustic life at Snitterfield, made his way to Stratford, and established himself as a trader in one of the leading thoroughfares of the town. This movement to the town probably took place in 1551, as in 1552 John Shakespeare is described in an official document as residing in Henley Street, where the poet was subsequently born. As to the precise nature of his occupation, the kind of wares in which he principally dealt, there are various and conflicting statements that have given rise to a good deal of discussion. The earliest official statement on the subject occurs in the register of the bailiff's court for the year 1556. He is there described as a "glover," which, according to the verbal usage of the time, included dealing in skins, as well as in the various leather-made articles of farming gear, such as rough gauntlets and leggings for hedging and ditching, white leather gloves for chopping wood and the like. But in addition to the trade of glover and fell-monger tradition assigns to John Shakespeare the functions of butcher, wool-stapler, corn-dealer, and timber-merchant. These occupations are not incompatible, and together they represent the main lines some of which at least a young farmer going into the town for trading purposes would be likely to pursue. He would naturally deal with the things he knew most about, such as corn, wool, timber, skins, and leather-made articles used in farm work—in a word, he would deal in farm conveniences and farm products. In a town that was the centre and chief market of an agricultural and grazing district, and as the member of a family whose wide connections were nearly all engaged in farming operations, his prospects were certainly rather favorable than otherwise. And he soon began to turn his country connection to account. There is distinct evidence that he early dealt in corn and wood as well as gloves and leather, for in 1556 he sues a neighbor for eighteen quarters of barley, and a few years later is paid three shillings by the corporation for a load of timber.

The poet's father was evidently a man of energy, ambition, and public spirit, with the knowledge and ability requisite for pushing his fortune with fair success in his new career. His youthful vigor and intelligence soon told in his favor, and in a short time we find him taking an active part in public affairs. He made way so rapidly indeed amongst his fellow-townsmen, that within five years after entering Stratford he is recognized as a fitting recipient of municipal honors; and his official appointments steadily rise in dignity and value through the various gradations of leet-juror, ale-taster, constable, affeeror, burgess, chamberlain, and alderman, until in 1568 he gains the most distinguished post of official dignity, that of high-bailiff or mayor of the town. Within twenty years after starting in business in Henley Street he thus rises to the highest place in the direction of municipal affairs, presiding as their head over the deliberations of his fellow aldermen and burgesses, and as chief magistrate over the local court of record. Three years later, in 1571, he was again elected as chief alderman. There is ample evidence, too, that during these years he advanced in material prosperity as well as in municipal dignities and honors. As early as 1556 he had means at his command which enabled him to purchase two houses in the town, one in Henley Street with a considerable garden, and another in Greenhill Street with a garden and croft attached to it. In the following year he married an heiress of gentle birth, Mary Arden of the Asbies, who had recently inherited under her father's will a substantial sum of ready money, an estate at Wilmcote, consisting of nearly 60 acres of land with two or three houses, and a reversionary interest in houses and lands at Snitterfield, including the farm tenanted by Richard Shakespeare, her husband's father. Being now a landed proprietor and a man of rising position and influence, John Shakespeare would be able to extend his business operations, and it is clear that he did so, though whether always with due prudence and foresight may be fairly questioned. To a man of his sanguine and somewhat impetuous temper the sudden increase of wealth was probably by no means an unmixed good. But for some years, at all events, he was able to maintain his more prosperous state, and his new ventures appear for a time to have turned out well. He is designated in official documents as yeoman, freeholder, and gentleman, and has the epithet "master" prefixed to his name; this, being equivalent to esquire, was rarely used except in relation to men of means and station, possessing landed property of their own. In a note to another official document it is stated that about the time of his becoming chief magistrate of Stratford John Shakespeare had "lands and tenements of good worth and substance" estimated in value at £500 [$2430], and though there may be some exaggeration in this estimate his property from various sources must have been worth nearly that sum. And in 1575 he increased the total amount by purchasing two houses in Henley Street, the two that still remain identified with the name and are consecrated by tradition as the birthplace of the poet. But this was his last purchase, the tide of his hitherto prosperous fortunes being but too clearly already on the turn. Having passed the highest point of social and commercial success, he was now facing the downward slope, and the descent once begun was for some years continuous, and at times alarmingly and almost inscrutably rapid.

The poet's father.

Early prosperity.

It seems clear indeed from the facts of the case that, notwithstanding John Shakespeare's intelligence, activity, and early success, there was some defect of character which introduced an element of instability into his career, and in the end very much neutralized the workings of his nobler powers. Faintly discernible perhaps from the first, and overpowered only for a time by the access of prosperity that followed his

Reverse of fortune.

fortunate marriage, this vital flaw ultimately produced its natural fruit in the serious embarrassments that clouded his later years. The precise nature of the defect can only be indicated in general terms, but it seems to have consisted very much in a want of measure and balance, of adequate care and foresight, in his business dealings and calculations. He seems to have possessed the eager sanguine temperament which, absorbed in the immediate object of pursuit, overlooks difficulties and neglects the wider considerations on which lasting success depends. Even in his early years at Stratford there are signs of this ardent, impatient, somewhat unheedful temper. He is not only active and pushing, but too restless and excitable to pay proper attention to necessary details, or discharge with punctuality the minor duties of his position. The first recorded fact in his local history illustrates this feature of his character. In April, 1552, John Shakespeare is fined twelve pence, equal to between eight and ten shillings [$1.94 and $2.43] of our English money now, for not removing the heap of household dirt and refuse that had accumulated in front of his own door. Another illustration of his want of thorough method and system in the management of his affairs is supplied by the fact that in the years 1556–57 he allowed himself to be sued in the bailiff's court for comparatively small debts. This could not have arisen from any want of means, as during the same period, in October, 1556, he made the purchase already referred to of two houses with extensive gardens. The actions for debt must therefore have been the result of negligence or temper on John Shakespeare's part, and either alternative tells almost equally against his habits of business coolness and regularity. Another illustration of his restless, ill-considered, and unbalanced energy may be found in the number and variety of occupations which he seems to have added to his early trade of glover and leather-dealer. As his prospects improved he appears to have seized on fresh branches of business, until he had included within his grasp the whole circle of agricultural products that could in any way be brought to market. It would seem also that he added farming, to a not inconsiderable extent, to his expanding retail business in Stratford. But it is equally clear that he lacked the orderly method, the comprehensive outlook, and the vigilant care for details essential for holding well in hand the threads of so complicated a commercial web. Other disturbing forces may probably be discovered in the pride and ambition, the love of social excitement and display, which appear to be among the ground notes of John Shakespeare's character so far as it is revealed to us in the few facts of his history. His strong social feeling and love of pleasurable excitement are illustrated by the fact that during the year of his mayoralty he brought companies of players into the town, and inaugurated dramatic performances in the guild hall. It is during the year of his filling the post of high-bailiff that we first hear of stage plays at Stratford, and the players must have visited the town, if not, as is most likely, at the invitation and desire of the poet's father, at least with his sanction and support. In such cases the players could not act at all without the permission of the mayor and council, and their first performance was usually a free entertainment, patronized and paid for by the corporation, and called the mayor's play. In all this John Shakespeare took the initiative, and in so doing probably helped to decide the future career of his son. The notes of personal pride and social ambition are equally apparent. It is on record, for example, that soon after reaching the highest post of municipal distinction the poet's father applied to the heralds' college for a grant of arms. This application was not at the time successful, but it seems to have been so far seriously entertained that official inquiries were made into the family history and social standing of the Shakespeares. But the remarkable fact is that such an application should have been made at all by a Stratford burgess whose position and prospects were so unstable and precarious as the events of the next few years showed those of John Shakespeare to be. At the time of the application his increasing family must have enlarged his household expenses, while his official position, combined with his open and generous nature, his love of social sympathy, distinction, and support, would probably have led him into habits of free-handed hospitality and inconsiderate expenditure. All this must have helped to introduce a scale of lavish domestic outlay that would tend directly to hasten the financial collapse in his affairs that speedily followed. And on finding things going against him John Shakespeare was just the man to discount his available resources, and, as the pressure increased, mortgage his future and adopt any possible expedient for maintaining the increased port and social consequence he had imprudently assumed.

This seems to have been the course actually pursued when pecuniary difficulties arose. During the three years that elapsed after his last purchase of house property his affairs became so seriously embarrassed that it was found necessary, if not to sacrifice, at least to jeopardize the most cherished future of the family in order to meet the exigencies of the moment. In 1578 John and Mary Shakespeare mortgaged for forty pounds [$194.40] their most considerable piece of landed property, the estate of the Asbies. The mortgagee was a family connection of their own, Edmund Lambert, who had married Mary Shakespeare's sister Joan. The subsequent history of this transaction shows how bitter must have been the need that induced the Shakespeares to surrender, even for a time, their full control over the ancestral estate. The next year, however, the pressure, instead of being relieved by the sacrifice, had become still more urgent, and the only outlying property that remained to meet it was the reversionary interest in the Snitterfield estate. Under a family settlement Mary Shakespeare, on the death of her stepmother, would come into the possession of houses and land at Snitterfield almost equal in value to the Asbies estate. But in 1579 the Shakespeares found it necessary to dispose altogether of this reversionary interest. In that year it was sold to Robert Webb for the sum of forty pounds [$194.40]. The buyer was a nephew of Mary Shakespeare, being the son of Alexander Webb, who had married her sister Margaret. In thus applying to relatives or family connections in their need, and disposing of their property to them, the Shakespeares may have hoped it would be more easily regained should times of prosperity return. The sacrifice of the remaining interests in the Snitterfield property afforded, however, only a temporary relief, quite insufficient to remove the accumulating burden of debt and difficulty which now weighed the Shakespeares down. The notes of the proceedings of the Stratford corporation and of the local court of record sufficiently show that John Shakespeare's adverse fortune continued through a series of years, and they also enable us in part to understand how he bore himself under the changes in his social position that followed. These changes begin in the critical year 1578. In January of that year, when his brother aldermen were called upon to pay a considerable sum each as a contribution to the military equipment to be provided by the town, John Shakespeare is so far relieved that only one half the amount is required from him. Later in the year we find him wholly exempted from the weekly tax paid by his fellow-aldermen for the relief of the poor. In the spring of the following year, on a further tax for military purposes being laid on the town, he is unable to contribute anything, and is accordingly reported as a defaulter. A few years later, in an action for a debt, a verdict is recorded against him, with the official report that he had no goods on which distraint could be made. About the same time he appears to have been under some restraint, if not actually imprisoned for debt. And as late as 1592 it is officially stated, as a result of an inquiry into the number who fail to attend the church service once a month according to the statutory requirement, that John Shakespeare with some others, two of whom, curiously enough, are named Fluellen and Bardolph, "come not to church for fear of process for debt." In the year 1586 another alderman had at length been chosen in his place, the reason given being expressly because "John Shakespeare doth not come to the halles when they are warned, nor hath not done for a long time."

Moral effects.

From this brief official record it would seem that under his reverse of fortune he was treated with marked sympathy and consideration by his fellow townsmen. For at least seven years after his troubles first began his fellow-burgesses persist in keeping his name in its place of honor on their roll, partly no doubt as a mark of respect for his character and past services, and partly it may be in the hope that his fortunes might improve and prosperous days return. And, when at length he is superseded by the appointment of another in his place, this is done, not on the ground of his reduced circumstances, but simply because he voluntarily absents himself from the council, never attends its meetings or takes any part in its affairs. This is a noteworthy fact illustrating still further John Shakespeare's character. The statement clearly indicates the kind of moral collapse that had followed the continuous pressure of material reverses. The eager sanguine nature that had so genially expanded in prosperity was, it is clear, sorely chilled and depressed by adversity. He abandons the usual places of resort, withdraws himself from the meetings of the corporation, and ceases to associate with his fellow-burgesses. And, what is perhaps still more noticeable, he gives up attending church, and no longer even worships with his fellow-townsmen. All this is the more significant because his circumstances, though seriously embarrassed, and for some years much reduced, were never so desperate as to compel him to part with his freehold property in Henley

Street. In the darkest hours of his clouded fortune he still retained the now world-famous houses associated with the poet's birth and early years. There was no adequate reason therefore why John Shakespeare should have so completely forsaken the usual haunts and regular assemblies of his fellow-townsmen and friends. But it seems clear, as already imtimated, that, while gifted with a good deal of native energy and intelligence, and possessing a temper that was proud, sensitive, and even passionate, John Shakespeare lacked the kind of fortitude and moral courage which enables men to meet serious reverses of fortune with dignity and reserve, if not with cheerfulnesss and hope. With the instinct of a wounded animal he seems to have left the prosperous herd and retired apart to bear his pain and loss in solitude and alone. Nor apparently did he hold up his head again until the efficient support of his prosperous son enabled him to take active measures for the recovery of his alienated estate and lost position in the town. By the middle of the last decade of the 16th century the poet's success in his profession was thoroughly assured, and he was on the high road to wealth and fame. As actor, dramatist, and probably also as sharer in the Blackfriars theatre, he was in the receipt of a large income, and according to tradition received a considerable sum from the young earl of Southampton, to whom his poems were dedicated. The son was now therefore as able as he had always been willing to help his father to regain the position of comfort and dignity he had formerly occupied. We find accordingly that in 1597 John and Mary Shakespeare filed a bill in Chancery against John Lambert for the recovery of the Asbies estate, which had been mortgaged to his father nearly twenty years before. There had indeed been some movement in the matter ten years earlier, on the death of Edward Lambert the mortgagee. His son John being apparently anxious to settle the dispute, it was proposed that he should pay an additional sum of twenty pounds [$97.20] in order to convert the mortgage into a sale, and that he should then receive from the Shakespeares an absolute title to the estate. The arrangement was not, however, carried out, and in 1589 John Shakespeare brought a bill of complaint against Lambert in the Court of Queen's Bench. Nothing further, however, seems to have been done, probably because Lambert may have felt that in the low state of the Shakespeares' fortune the action could not be pressed. In 1597, however, there was a change in the relative position of the litigants, John Shakespeare having now the purse of his son at his command, and a bill in Chancery was accordingly filed against John Lambert. The plea in support of the Shakespeares' claim was that the original conditions of the mortgage had been fulfilled, the money in discharge having been offered to Edward Lambert at the proper date, but refused by him on the ground that other sums were owing which must also be repaid at the same time. To this plea John Lambert replied, and there is a still further "replication" on the part of the Shakespeares. How the matter was eventually decided is not known, no decree of the court in the case having been discovered. But the probabilities are that it was settled out of court, and, as the estate did not return to the Shakespeares, probably on the basis of the proposal already made, —that of the payment of an additional sum by John Lambert. About the same date, or rather earlier, in 1596, John Shakespeare also renewed his application to the herald's college for a grant of arms, and this time with success. The grant was made on the ground that the history and position of the Shakespeare and Arden families fully entitled the applicant to receive coat armor. There can be no doubt that the means required for supporting these applications were supplied by the poet, and he would be well rewarded by the knowledge that in the evening of his days his father had at length realized the desire of his heart, being officially recognized as a "gentleman of worship." And, what would now perhaps please his father still better, he would be able to hand on the distinction to his son, whose profession prevented him at the time from gaining it on his own account. John Shakespeare died in 1601, having through the affectionate care of his son spent the last years of his life in the ease and comfort befitting one who had not only been a prosperous burgess, but chief alderman and mayor of Stratford.

The poet's mother.

Of Mary Arden, the poet's mother, we know little, hardly anything directly indeed; but the little known is wholly in her favor. From the provisions of her father's will it is clear that of his seven daughters she was his favorite; and the links of evidence are now complete connecting her father Robert Arden with the great Warwickshire family of Arden, whose members had more than once filled the posts of high-sheriff and lord-lieutenant of the county. She was thus descended from an old county family, the oldest in Warwickshire, and had inherited the traditions of gentle birth and good breeding. Her ancestors are traced back, not only to Norman, but to Anglo-Saxon times, Alwin, an early representative of the family, and himself connected with the royal house of Athelstane, having been *vice-comes* or sheriff of Warwickshire in the time of Edward the Confessor. His son Turchill retained his extensive possessions under the Conqueror; and, when they were divided on the marriage of his daughter Margaret to a Norman noble created by William Rufus earl of Warwick, Turchill betook himself to his numerous lordships in the Arden district of the county, and assumed the name of De Ardern or Arden. His descendants, who retained the name, multiplied in the shire, and were united in marriage from time to time with the best Norman blood of the kingdom. The family of Arden thus represented the union, under somewhat rare conditions of original distinction and equality, of the two great race elements that have gone to the making of the typical modern Englishman. The immediate ancestors of Mary Shakespeare were the Ardens of Parkhall, near Aston in the northwestern part of the shire. During the Wars of the Roses Robert Arden of Parkhall, being at the outset of the quarrel a devoted Yorkist, was seized by the Lancastrians, attached for high treason, and executed at Ludlow in 1452. He left an only son, Walter Arden, who was restored by Edward IV. to his position in the country, and received back his hereditary lordships and lands. At his death in 1502 he was buried with great state in Aston church, where three separate monuments were erected to his memory. He had married Eleanor, second daughter of John Hampden of Bucks, and by her had eight children, six sons and two daughters. The eldest son, Sir John Arden of Parkhall, having been for some years esquire of the body of Henry VII., was knighted and rewarded by that monarch. Sir John was the great-uncle of Mary Shakespeare,—his brother Thomas, the second son of Walter Arden, being her grandfather. Thomas Arden is found residing at Aston Cantlowe during the first half of the 16th century, and in the year 1501 he united with his son Robert Arden, Mary Shakespeare's father, in the purchase of the Snitterfield estate. Mary Shakespeare was thus directly connected by birth and lineage with those who had taken, and were to take, a foremost part in the great conflicts which constitute turning-points in the history of the country. On her father's side she was related to Robert Arden, who in the 15th century lost his life while engaged in rallying local forces on behalf of the White Rose, and on her mother's side to John Hampden, who took a still more distinguished part in the momentous civil struggles of the 17th century.

Family of Arden.

A very needless and abortive attempt has been made to call in question Robert Arden's social and family position on the ground that in a contemporary deed he is called a husbandman (*agricola*),—the assumption being that a husbandman is simply a farm-laborer. But the term husbandman was often used in Shakespeare's day to designate a landed proprietor who farmed one of his own estates. The fact of his being spoken of in official documents as a husbandman does not therefore in the least affect Robert Arden's social position, or his relation to the great house of Arden, which is now established on the clearest evidence. He was, however, a younger member of the house, and would naturally share in the diminished fortune and obscurer career of such a position. But, even as a cadet of so old and distinguished a family, he would tenaciously preserve the generous traditions of birth and breeding he had inherited. Mary Arden was thus a gentlewoman in the truest sense of the term, and she would bring into her hus-

band's household elements of character and culture that would be of priceless value to the family, and especially to the eldest son, who naturally had the first place in her care and love. A good mother is to an imaginative boy his earliest ideal of womanhood, and in her for him are gathered up, in all their vital fulness, the tenderness, sympathy, and truth, the infinite love, patient watchfulness, and self-abnegation of the whole sex. And the experience of his mother's bearing and example during the vicissitudes of their home life must have been for the future dramatist a vivid revelation of the more sprightly and gracious, as well as of the profounder elements, of female character. In the earlier and prosperous days at Stratford, when all within the home circle was bright and happy, and in her intercourse with her boy Mary Shakespeare could freely unfold the attractive qualities that had so endeared her to her father's heart, the delightful image of the young mother would melt unconsciously into the boy's mind, fill his imagination, and become a storehouse whence in after years he would draw some of the finest lines in his matchless portraiture of women. In the darker days that followed he would learn something of the vast possibilities of suffering, personal and sympathetic, belonging to a deep and sensitive nature, and as the troubles made head he would gain some insight into the quiet courage and self-possession, the unwearied fortitude, sweetness, and dignity which such a nature reveals when stirred to its depth by adversity, and rallying all its resources to meet the inevitable storms of fate. These storms were not simply the ever-deepening pecuniary embarrassments and consequent loss of social position. In the very crisis of the troubles, in the spring of 1579, death entered the straitened household, carrying off Ann, the younger of the only two remaining daughters of John and Mary Shakespeare. A characteristic trait of the father's grief and pride is afforded by the entry in the church books that a somewhat excessive sum was paid on this occasion for the tolling of the bell. Even with ruin staring him in the face John Shakespeare would forego no point of customary respect nor abate one jot of the ceremonial usage proper to the family of an eminent burgess, although the observance might involve a very needless outlay. In passing through these chequered domestic scenes and vividly realizing the alternations of grief and hope, the eldest son, even in his early years, would gain a fund of memorable experiences. From his native sensibility and strong family affection he would passionately sympathize with his parents in their apparently hopeless struggle against the slings and arrows of outrageous fortune. Above all he would cherish the memory of his mother's noble bearing alike under serene and clouded skies, and learn to estimate at their true worth the refined strength of inherited courage, the dignified grace and silent helpfulness of inherited courtesy and genuine kindness of heart. These recollections were vitalized in the sprightly intelligence, quick sympathy, and loving truthfulness belonging to the female characters of his early comedies, as well as in the profounder notes of womanly grief and suffering, struck with so sure a hand and with such depth and intensity of tone, in the early tragedies.

Mary Arden —character and influence.

But in addition to her constant influence and example the poet was probably indebted to his mother for certain elements of his own mind and character directly inherited from her. This position may be maintained without accepting the vague and comparatively empty dictum that Shakespeare derived his genius from his mother, as many eminent men are loosely said to have done. The sacred gift of genius has ever been, and perhaps always will be, inexplicable. No analysis, however complete, of the forces acting on the individual mind can avail to extract this vital secret. The elements of race, country, parentage, and education, though all powerful factors in its development, fail adequately to account for the mystery involved in pre-eminent poetical genius. Like the unseen wind from heaven it bloweth where it listeth, and the inspired voice is gladly heard of men, but none can tell whence it cometh or whither it goeth. While, however, genius is thus without ancestry or lineage, there are elements of character and qualities of mind that, like the features of the countenance and the lines of the bodily frame, appear to be clearly transmissible from parent to child. Shakespeare not unfrequently recognizes this general truth, especially in relation to moral qualities; and it is mainly qualities of this kind that he himself appears to have inherited from his gently born and nurtured mother, Mary Arden of the Asbies. At least it is hardly fanciful to say that in the life and character of the poet we may trace elements of higher feeling and conduct derived from the hereditary culture and courtesy, the social insight and refinement of the Ardens. Amongst such elements may be reckoned his strong sense of independence and self-respect, his delicate feeling of honor, his habitual consideration for others, and, above all perhaps, his deep instinctive regard for all family interests and relationships, for everything indeed connected with family character and position. The two epithets which those who knew Shakespeare personally most habitually applied to him appear to embody some of these characteristics. They unite in describing him as "gentle" and "honest" in character, and of an open and free, a frank and generous disposition. The epithet "gentle" may be taken to represent the innate courtesy, the delicate consideration for the feelings of others, which belongs in a marked degree to the best representatives of gentle birth, although happily it is by no means confined to them. The second epithet, "honest," which in the usage of the time meant honorable, may be taken to express the high spirit of independence and self-respect which carefully respects the just claims and rights of others. One point of the truest gentle breeding, which, if not inherited from his mother, must have been derived from her teaching and example, is the cardinal maxim, which Shakespeare seems to have faithfully observed, as to nice exactness in money matters—the maxim not lightly to incur pecuniary obligations, and if incurred to meet them with scrupulous precision and punctuality. This he could not have learnt from his father, who, though an honest man enough, was too eager and careless to be very particular on the point. Indeed, carelessness in money matters seems rather to have belonged to the Snitterfield family, the poet's uncle Henry having been often in the courts for debt, and, as we have seen, this was true of his father also. But, while his father was often prosecuted for debt, no trace of any such action against the poet himself, for any amount however small, has been discovered. He sued others for money due to him and at times for sums comparatively small, but he never appears as a debtor himself. Indeed, his whole life contradicts the supposition that he would ever have rendered himself liable to such a humiliation. The family troubles must have very early developed and strengthened the high feeling of honor on this vital point he had inherited. He must obviously have taken to heart the lesson his father's imprudence could hardly fail to impress on a mind so capacious and reflective. John Shakespeare was no doubt a warm-hearted lovable man, who would carry the sympathy and affection of his family with him through all his troubles, but his eldest son, who early understood the secret springs as well as the open issues of life, must have realized vividly the rock on which their domestic prosperity had been wrecked, and before he left home he had evidently formed an invincible resolution to avoid it at all hazards. This helps to explain what has often excited surprise in relation to his future career—his

Qualities inherited from his mother.

business industry, financial skill, and steady progress to what may be called worldly success. Few things are more remarkable in Shakespeare's personal history than the resolute spirit of independence he seems to have displayed from the moment he left his straitened household to seek his fortunes in the world to the time when he returned to live at Stratford as a man of wealth and position in the town. While many of his fellow dramatists were spendthrifts, in constant difficulties, leading disorderly lives, and sinking into unhonored graves, he must have husbanded his early resources with a rare amount of quiet firmness and self-control. Chettle's testimony as to Shakespeare's character and standing during his first years in London is decisive on this head. Having published a posthumous work by Greene, in which Marlowe and Shakespeare were somewhat sharply referred to, Chettle expressed his regret in a preface to a work of his own issued a few months later, in December, 1592; he intimates that at the time of publishing Greene's *Groatsworth of Wit* he knew neither Marlowe nor Shakespeare, and that he does not care to become acquainted with the former. But having made Shakespeare's acquaintance in the interval he expresses his regret that he should, even as editor, have published a word to his disparagement, adding this remarkable testimony: "Because myself have seen his demeanor, no less civil than he excellent in the qualities he professes: besides, divers of worship have reported his uprightness of dealing, which argues his honesty, and his facetious grace in writing, which approves his art." So that Shakespeare, during his earliest and most anxious years in London, had not only kept himself out of debt and difficulty, but had established a reputation of strictly honorable conduct, "divers of worship,"—*i.e.*, men of position and authority entitled to speak on such a point, "having reported his uprightness of dealing, which argued his honesty." Now, considering the poet's associates, occupation, and surroundings, this is significant testimony, and conclusively proves that, although fond of social life and its enjoyments, and without a touch of harshness or severity in his temper, he yet held himself thoroughly in hand, that amidst the ocean of new experiences and desires on which he was suddenly launched he never abandoned the helm, never lost command over his course, never sacrificed the larger interests of the future to the clamorous or excessive demands of the hour. And this no doubt indicates the direction in which he was most indebted to his mother. From his father he might have derived ambitious desires, energetic impulses, and an excitable temper capable of rushing to the verge of passionate excess, but, if so, it is clear that he inherited from his mother the firmness of nerve and fibre as well as the ethical strength required for regulating these violent and explosive elements. If he received as a paternal heritage a very tempest and whirlwind of passion, the maternal gift of temperance and measure would help to give it smoothness and finish in the working, would supply in some degree at least the power of concentration and self-control indispensable for moulding the extremes of exuberant sensibility and passionate impulse into forms of intense and varied dramatic portraiture; and of course all the finer and regulative elements of character and disposition derived from the spindle side of the house would, throughout the poet's early years, be strengthened and developed by his mother's constant presence, influence, and example.

Shakespeare's birth.

John and Mary Shakespeare had eight children, four sons and four daughters. Of the latter, two, the first Joan and Margaret, died in infancy, before the birth of the poet, and a third, Anne, in early childhood. In addition to the poet, three sons, Gilbert, Richard, and Edmund, and one daughter, the second Joan, lived to maturity and will be referred to again. William Shakespeare was christened in Stratford church on April 26, 1564, having most probably been born, according to tradition, on the 23d. In July of the same year the town was visited by a severe outbreak of the plague, which in the course of a few months carried off one-sixth of the inhabitants. Fortunately, however, the family of the Shakespeares wholly escaped the contagion, their exemption being probably due to the fact that they lived in the healthiest part of the town, away from the river side, on a dry and porous soil. At the back of Henley street, indeed, were the gravel pits of the guild, which were in frequent use for repairing the inundated pathways near the river after its periodical overflows. For two years and a half William, their first-born son, remained the only child of his parents, and all his mother's love and care would naturally be lavished upon him. A special bond would in this way be established between mother and child, and, his father's affairs being at the time in a highly prosperous state, Mary Shakespeare would see to it that the boy had all the pleasures and advantages suitable to his age, and which the family of a foremost Stratford burgess could easily command.

Early life.

Healthy outdoor enjoyment is not the least valuable part of a boy's education, and the chief recreations available for the future dramatist in those early years would be the sports and pastimes, the recurring festivals, spectacles, and festivities, of the town and neighborhood, especially the varying round of rural occupations and the celebration in the forest farms and villages of the chief incidents of the agricultural year. Seed time and harvest, summer and winter, each brought its own group of picturesque merry-makings, including some more important festivals that evoked a good deal of rustic pride, enthusiasm, and display. There were, during these years, at least three of the forest farms where the poet's parents would be always welcome, and where the boy must have spent many a happy day amidst the freedom and delights of outdoor country life. At Snitterfield his grandfather would be proud enough of the curly-headed youngster with the fine hazel eyes, and his uncle Henry would be charmed at the boy's interest in all he saw and heard as he trotted with him through the byres and barns, the poultry yard and steading, or, from a safe nook on the bushy margin of the pool, enjoyed the fun and excitement of sheep-washing, or later on watched the mysteries of the shearing and saw the heavy fleece fall from the sides of the palpitating victim before the sure and rapid furrowing of the shears. He would no doubt also be present at the shearing feast and see the queen of the festival receive her rustic guests and distribute amongst them her floral gifts. At Wilmecote, in the solid oak-timbered dwelling of the Asbies, with its well-stocked garden and orchard, the boy would be received with cordial hospitality, as well as with the attention and respect due to his parents as the proprietors and to himself as the heir of the maternal estate. At Shottery the welcome of the Shakespeares would not be less cordial or friendly, as there is evidence to show that as early as 1566 the families were known to each other, John Shakespeare having in that year rendered Richard Hathaway an important personal service. Here the poet met his future bride, Anne Hathaway, in all the charm of her sunny girlhood, and they may be said to have grown up together, except that from the difference of their ages she would reach early womanhood while he was yet a stripling. In his later youthful years he would thus be far more frequently at the Hathaway farm than at Snitterfield or the Asbies. There were, however, family connections of the Shakespeares occupying farms further afield,—Hills and Webbs at Bearley and Lamberts at Barton-on-the Heath. There was thus an exceptionally wide circle of country life open to the poet during his growing years. And in those years he must have repeatedly gone the whole picturesque round with the fresh senses and eager feel-

Rural sports and country rambles.

ing, the observant eye and open mind, that left every detail, from the scarlet hips by the wayside to the proud tops of the eastern pines, imprinted indelibly upon his heart and brain. Hence the apt and vivid reference to the scenes and scenery of his youth, the intense and penetrating glances at the most vital aspects as well as the minutest beauties of nature, with which his dramas abound. These glances are so penetrating, the result of such intimate knowledge and enjoyment, that they often seem to reveal in a moment, and by a single touch as it were, all the loveliness and charm of the objects thus rapidly flashed on the inward eye. In relation to the scenes of his youth what fresh and delightful hours at the farms are reflected in the full summer beauty and motley humors of a sheep-shearing festival in the *Winter's Tale;* in the autumn glow of the "sun-burnt sicklemen and sedge-crowned nymphs" of the masque in the *Tempest;* and in the vivid pictures of rural sights and sounds in spring and winter so musically rendered in the owl and cuckoo songs of *Love's Labor's Lost!* But, in addition to the festivities and merry-makings of the forest farms, it is clear that, in his early years, the poet had some experience of country sports proper, such as hunting, hawking, coursing, wild-duck shooting, and the like. Many of these sports were pursued by the local gentry and yeomen together, and the poet as the son of a well-connected burgess of Stratford, who had recently been mayor of the town and possessed estates in the county, would be well entitled to share in them, while his handsome presence and courteous bearing would be likely to ensure him a hearty welcome. If any of the stiffer local magnates looked coldly upon the high-spirited youth, or resented in any way his presence amongst them, their conduct would be likely enough to provoke the kind of sportive retaliations that might naturally culminate in the deer-stealing adventure. However this may be, it is clear from internal evidence that the poet was practically familiar with the field sports of his day.

In the town the chief holiday spectacles and entertainments were those connected with the Christmas, New Year, and Easter festivals, the May-day rites and games, the pageants of delight of Whitsuntide, the beating of the bounds during Rogation week, and the occasional representation of mysteries, moralities, and stage-plays. In relation to the main bent of the poet's mind, and the future development of his powers, the latter constituted probably the most important educational influence and stimulus which the social activities and public entertainments of the place could have supplied. Most of these recurring celebrations involved, it is true, a dramatic element,—some hero or exploit, some emblem or allegory, being represented by means of costumed personations, pantomime and dumb show, while in many cases songs, dances, and brief dialogues were interposed as part of a performance. There were masques and morris-dancing on May-day, as well as mummers and waits at Christmas. In a number of towns and villages the exploits of Robin Hood and his associates were also celebrated on May-day, often amidst a picturesque confusion of floral emblems and forestry devices. In Shakespeare's time the May-day rites and games thus included a variety of elements charged with legendary, historical and emblematical significance. But, notwithstanding this mixture of festive elements, the celebration as a whole retained its leading character and purpose. It was still the spontaneous meeting of town and country to welcome the fresh beauty of the spring, the welcome being reflected in the open spaces of the sports by tall painted masts decked with garlands, streamers, and flowery crowns, and in the public thoroughfares by the leafy screens and arches, the bright diffused blossoms and fragrant spoils brought from the forest by rejoicing youths and maidens at the dawn. May-day was thus well-fitted to be used, as it often is by Shakespeare, as the comprehensive symbol of all that is delightful and exhilarating in the renewed life and vernal freshness of the opening year.

Holiday spectacles and festivities.

May day.

After May-day, Whitsuntide was at Stratford perhaps the most important season of festive pageantry and scenic display. In addition to the procession of the guild and trades and the usual holiday ales and sports, it involved a distinct and somewhat noteworthy element of dramatic representation. And, as in the case of the regular stage-plays, the high-bailiff and council appear to have patronized and supported the performances. We find in the chamberlain's accounts entries of sums paid "for exhibiting a pastyme at Whitsuntide." Shakespeare himself refers to these dramatic features of the celebration, and in a manner that almost suggests he may in his youth have taken part in them. However this may be, the popular celebrations of Shakespeare's youth must have supplied a kind of training in the simpler forms of poetry and dramatic art, and have afforded some scope for the early exercise of his own powers in both directions. This view is indirectly confirmed by a passage in the early scenes of *The Return from Parnassus*, where the academic speakers sneer at the poets who come up from the country without any university training. The sneer is evidently the more bitter as it implies that some of these poets had been successful,—more successful than the college-bred wits. The academic critics suggest that the nurseries of these poets were the country ale-house and the country green,—the special stimulus to their powers being the May-day celebrations, the morris-dances, the hobby-horse, and the like.

Whitsuntide.

But the moralities, interludes, and stage-plays proper afforded the most direct and varied dramatic instruction available in Shakespeare's youth. The earliest popular form of the drama was the mystery or miracle play, dealing in the main with Biblical subjects; and, Coventry being one of the chief centres for the production and exhibition of the mysteries, Shakespeare had ample opportunities of becoming well acquainted with them. Some of the acting companies formed from the numerous trade guilds of the "shire-town" were moreover in the habit of visiting the neighboring cities for the purpose of exhibiting their plays and pageants. There is evidence of their having performed at Leicester and Bristol in Shakespeare's youth, and on returning from the latter city they would most probably have stopped at Stratford and given some performances there. And in any case, Coventry being so near to Stratford, the fame of the multiplied pageants presented during the holiday weeks of Easter and Whitsuntide, and especially of the brilliant concourse that came to witness the grand series of Corpus Christi plays, would have early attracted the young poet; and he must have become familiar with the precincts of the Gray Friars at Coventry during the celebration of these great ecclesiastical festivals. The indirect evidence of this is supplied by Shakespeare's references to the well-known characters of the mysteries, such as Herod and Pilate, Cain and Judas, Termagaunt with his turbaned Turks and infidels, blackburning souls, grim and gaping hell, and the like. The moralities and interludes that gradually took the place of the Biblical mysteries were also acted by companies of strolling players over a wide area in the towns and cities of the Midland and western counties. Malone gives from an eye-witness a detailed and graphic account of the public acting of one of these companies at Gloucester in 1569, the year during which the poet's father as high-bailiff had brought the stage-players into Stratford and inaugurated a series of performances in the guild hall. The play acted at Gloucester was *The Cradle of Security*, one of the most striking and popular of the early moralities or interludes. Willis, the writer of the account, was just Shakespeare's age, having been born in 1564. As a

Interludes and stage-plays.

boy of five years old he had been taken by his father to see the play, and, standing between his father's knees, watched the whole performance with such intense interest that, writing about it seventy years afterwards, he says, "the subject took such an impression upon me that when I came afterwards towards man's estate it was as fresh in my memory as if I had seen it newly enacted." In proof of this he gives a clear and detailed outline of the play. Willis was evidently a man of no special gifts, and, if the witnessing a play when a child could produce on an ordinary mind so memorable an impression, we may imagine what the effect would be on the mind of the marvellous boy who, about the same time and under like circumstances, was taken by his father to see the performances at Stratford. The company that first visited Stratford being a distinguished one, their plays were probably of a higher type and better acted than *The Cradle of Security* at Gloucester: and their effect on the young poet would be the more vivid and stimulating from the keener sensibilities and latent dramatic power to which in his case they appealed. These early impressions would be renewed and deepened with the boy's advancing years. During the decade of Shakespeare's active youth from 1573 to 1584 the best companies in the kingdom constantly visited Stratford, and he would thus have the advantage of seeing the finest dramas yet produced acted by the best players of the time. This would be for him a rich and fruitful experience of the flexible and impressive form of art which at a moment of exuberant national vitality was attracting to itself the scattered forces of poetic genius, and soon gained a position of unrivalled supremacy. As he watched the performance in turn of the various kinds of interlude, comedy, and pastoral, of chronicle and biographical plays, of historical, domestic, or realistic tragedy, he would gain in instructive insight into the wide scope and vast resources of the rising drama. And he would have opportunities of acquiring some knowledge of stage business, management, and effects, as well as of dramatic form. Amongst the companies that visited Stratford were those of the powerful local earls of Leicester, Warwick, and Worcester, whose members were largely recruited from the Midland counties. The earl of Leicester's company, the most eminent of all, included several Warwickshire men, while some of the leading members, like the elder Burbage, appear to have been natives of Stratford or the immediate neighborhood. And the poet's father being, as we have seen, so great a friend of the players, and during his most prosperous years in constant communication with them, his son would have every facility for studying their art. Curiosity and interest and the like would prompt him to find out all he could about the use of the stage "books," the distribution of the parts, the cues and exits, the management of voice and gesture, the graduated passion and controlled power of the leading actors in the play, the just subordination of the less important parts, and the measure and finish of each on which the success of the whole so largely depended. It is not improbable, too, that in connection with some of the companies Shakespeare may have tried his hand both as poet and actor even before leaving Stratford. His poetical powers could hardly be unknown, and he may have written scenes and passages to fill out an imperfect or complete a defective play; and from his known interest in their work he may have been pressed by the actors to appear in some secondary part on the stage. In any case he would be acquainted with some of the leading players in the best companies, so that when he decided to adopt their profession he might reasonably hope on going to London to find occupation amongst them without much difficulty or delay.

Shakespeare received the technical part or scholastic elements of his education in the grammar school of his native town. The school was an old foundation dating from the second half of the 15th century and connected with the guild of the Holy Cross. But, having shared the fate of the guild at the suppression of religious houses, it was restored by Edward VI. in 1553, a few weeks before his death. The "King's New School," as it was now called, thus represented the fresh impulse given to education throughout the kingdom during the reign of Henry VIII.'s earnest-minded son, and well sustained under the enlightened rule of his sister, the learned virgin queen. What the course of instruction was in these country schools during the second half of the 16th century has recently been ascertained by special research,[1] and may be stated, at least in outline, with some degree of certainty and precision. As might have been expected, Latin was the chief scholastic drill, the thorough teaching of the Roman tongue being, as the name implies, the very purpose for which the grammar schools were originally founded. The regular teaching of Greek was indeed hardly introduced into the country school until a somewhat later period. But the knowledge of Latin, as the language of all the learned professions, still largely used in literature, was regarded as quite indispensable. Whatever else might be neglected, the business of "gerund-grinding" was vigorously carried on, and the methods of teaching, the expedients and helps devised for enabling the pupils to read, write and talk Latin, if rather complex and operose, were at the same time ingenious and effective. As a rule the pupil entered the grammar school at seven years old, having already acquired either at home or at the petty school the rudiments of reading and writing. During the first year the pupils were occupied with the elements of Latin grammar, the accidence, and lists of common words which were committed to memory and repeated two or three times a week, as well as further impressed upon their minds by varied exercises. In the second year the grammar was fully mastered, and the boys were drilled in short phrase-books, such as the *Sententiæ Pueriles*, to increase their familiarity with the structure and idioms of the language. In the third year the books used were Æsop's *Fables*, Cato's *Maxims*, and some good manual of school conversation, such as the *Confabulationes Pueriles*. The most popular of these manuals in Shakespeare's day was that by the eminent scholar and still more eminent teacher Corderius. His celebrated *Colloquies* were probably used in almost every school in the kingdom; and Hoole, writing in 1652, says that the worth of the book had been proved "by scores if not hundreds of impressions in this and foreign countries." Bayle, indeed, says that from its universal use in the schools the editions of the book might be counted by thousands. This helps to illustrate the colloquial use of Latin, which was so essential a feature of grammar school discipline in the 16th and 17th centuries. The evidence of Brinsley, who was Shakespeare's contemporary, conclusively proves that the constant speaking of Latin by all the boys of the more advanced forms was indispensable even in the smallest and poorest of the country grammar schools. The same holds true of letter-writing in Latin; and this, as we know from the result, was diligently and successfully practiced in the Stratford grammar school. During his school days, therefore, Shakespeare would be thoroughly trained in the conversational and epistolary use of Latin, and several well-known passages in his dramas show that he did not forget this early experience, but that like everything else he acquired it turned to fruitful uses in his hands. The books read in the more advanced forms of the school were the *Eclogues* of Mantuanus, the *Tristia* and *Metamorphoses* of Ovid, Cicero's *Offices*, *Orations*, and *Epistles*, the *Georgics* and *Æneid* of Virgil, and in the highest form parts of Juvenal, of the comedies of Terence and Plautus, and of the tragedies of Seneca. Shakespeare, having remained at school for at least six years, must

School education.

[1] "What Shakespeare learnt at School," *Fraser's Magazine*, Nov. 1879, Jan. and May, 1880.

have gone through a greater part of this course, and, being a pupil of unusual quickness and ability, endowed with rare strength of mental grip and firmness of moral purpose, he must during those years have acquired a fair mastery of Latin, both colloquial and classical. After the difficulties of the grammar had been overcome, his early intellectual cravings and poetic sensibilities would be alike quickened and gratified by the new world of heroic life and adventure opened to him in reading such authors as Ovid and Virgil. Unless the teaching at Stratford was very exceptionally poor he must have become so far familiar with the favorite school authors, such as Ovid, Tully, and Virgil, as to read them intelligently and with comparative ease.

And there is no reason whatever for supposing that the instruction at the Stratford grammar school was less efficient than in the grammar schools of other provincial towns of about the same size. There is abundant evidence to show that, with the fresh impulse given to education under energetic Protestant auspices in the second half of the 16th century, the teaching even in the country grammar schools was as a rule painstaking, intelligent, and fruitful. Brinsley himself was for many years an eminent and successful teacher in the grammar school of Ashby-de-la-Zouche, a small town on the borders of Warwickshire, only a few miles indeed from Coventry; and in his *Ludus Literarius*, referring to a book of exercises on the Latin accidence and grammar he had prepared, he says that he had chiefly followed the order of the questions "of that ancient schoolmaster Master Brunsword of Maxfield (Macclesfield) in Cheshire, so much commended for his order and schollers; who, of all other, commeth therein the nearest unto the marke." Another provincial schoolmaster, Mr. Robert Doughty, a contemporary of Shakespeare, who was for nearly fifty years at the head of the Wakefield grammar school, is celebrated by Hoole, not only as an eminent teacher who had constantly sent out good scholars, but as one who had produced a class of teachers emulating his own educational zeal and intelligence. The masters of the Stratford grammar school in Shakespeare's time seem to have been men of a similar stamp. One of them, John Brunsword, who held the post for three years during the poet's childhood, was almost certainly a relative, probably a son, of the eminent Macclesfield master whose character and work Brinsley praises so highly. At least Brunsword being an uncommon name, when we find it borne by two grammar-school masters in neighboring counties who flourished either together or in close succession to each other, it is natural to conclude that there must have been some relationship between them, and if so we may be sure that the Stratford master, who was evidently the younger man, had been well trained and must have proved an efficient teacher. The masters who followed Brunsword were university men of at least average attainments and ability, as they rapidly gained promotion in the church. Thomas Hunt, who was head-master during the most important years of Shakespeare's school course, became incumbent of the neighboring village of Luddington; and, if there is any truth in the tradition that the poet's marriage was celebrated there, it is not improbable that, from having been a favorite pupil, he may have become the personal friend of his former master. In any case, during the years of his school attendance the poet must have gained sufficient knowledge of Latin to read for his own instruction and delight the authors included in the school curriculum who had struck his fancy and stimulated his awakening powers. While his writings supply clear evidence in support of this general position, they also bring out vividly the fact that Ovid was a special favorite with Shakespeare at the outset of his career. The influence of this romantic and elegiac Roman poet is indeed strongly marked and clearly traceable in the poems as well as in the early plays.

Home life on leaving school.

According to Rowe's account, Shakespeare was withdrawn from school about 1578, a year or two before he had completed the usual course for boys going into business or passing on to the universities. The immediate cause of the withdrawal seems to have been the growing embarrassments of John Shakespeare's affairs, the boy being wanted at home to help in the various departments of his father's business. The poet had just entered on his fifteenth year, and his school attainments and turn for affairs, no less than his native energy and ability, fitted him for efficient action in almost any fairly open career. But open careers were not numerous at Stratford, and John Shakespeare's once prosperous way of life was now hampered by actual and threatening difficulties which the zeal and affection of his son were powerless to remove or avert. No doubt the boy did his best, trying to understand his father's position, and discharging with prompt alacrity any duties that came to be done. But he would soon discover how hopeless such efforts were, and with this deepening conviction there would come upon him the reaction of weariness and disappointment, which is the true *inferno* of ardent youthful minds. His father's difficulties were evidently of the chronic and complicated kind against which the generous and impulsive forces of youth and inexperience are of little avail. And, after his son had done his utmost to relieve the sinking fortunes of the family, the aching sense of failure would be among the bitterest experiences of his early years, would be indeed a sharp awakening to the realities and responsibilities of life. Within the narrow circle of his own domestic relationships and dearest interests he would feel with Hamlet that the times were out joint, and in his gloomier moods be ready to curse the destiny that seemed to lay upon him, in part at least, the burden of setting the obstinately crooked straight. As a relief from such moods and a distraction from the fruitless toils of home affairs, he would naturally plunge with keener zest into such outlets for youthful energy and adventure as the town and neighborhood afforded. What the young poet's actual occupations were during the four years and a half that elapsed between his leaving school and his marriage we have no adequate materials for deciding in any detail. But the local traditions on the subject would seem to indicate that after the adverse turn in his fortunes John Shakespeare had considerably contracted the area of his commercial transactions. Having virtually alienated his wife's patrimony by the mortgage of the Asbies and the disposal of all interest in the Snitterfield property, he seems to have given up the agricultural branches of his business, retaining only his original occupation of dealer in leather, skins, and sometimes carcasses as well. His wider speculations had probably turned out ill, and having no longer any land of his own he apparently relinquished the corn and timber business, restricting himself to the town trades of fellmonger, wool-stapler, and butcher. Aubrey at least had heard that Shakespeare after leaving school assisted his father in these branches,—and at times with a deal of youthful extravagance indicative of irrepressible energy and spirit. Aubrey also reports, on the authority of Beeston, and as incidentally proving he knew Latin fairly well, that for a time the poet was a teacher in a country school; while Malone believed from the internal evidence of his writings that he had spent two or three years in a lawyer's office. These stories may be taken to indicate, what is no doubt true, that at a time of domestic need the poet was ready to turn his hand to anything that offered. It is no doubt also true that he would prefer the comparative retirement and regularity of teaching or clerk's work to the intermittent drudgery and indolence of a retail shop in a small market-town. There is, however, no direct evidence in favor of either supposition; and the indirect evidence for the lawyer's office theory which has found favor with several recent critics is by no means decisive. Whether engaged in a lawyer's office or not, we may be quite sure that during the years of adolescence he was actively occupied in work of some kind or other. He was far too sensible and energetic to remain without employment; shapeless idleness had no attraction for his healthy nature, and his strong family feeling is certainly in favor of the tradition that for a time he did his best to help his father in his business.

But, however he may have been employed, this interval of home life was for the poet a time of active

growth and development, and no kind of business routine could avail to absorb his expanding powers or repress the exuberant vitality of his nature. During these critical years, to a vigorous and healthy mind such as Shakespeare possessed, action—action of an adventurous and recreative kind, in which the spirit is quickened and refreshed by new experiences—must have become an absolute necessity of existence. The necessity was all the more urgent in Shakespeare's case from the narrower circle within which the once prosperous and expanding home life was now confined. We have seen that the poet occasionally shared the orthodox field sports organized by the country gentlemen, where landlords and tenants, yeomen and squires, animated by a kindred sentiment, meet to a certain extent on common ground. But this long-drawn pursuit of pleasure as an isolated unit in a local crowd would hardly satisfy the thirst for passionate excitement and personal adventure which is so dominant an impulse in the hey-day of youthful blood. It is doubtful, too, whether in the decline of his father's fortunes Shakespeare would have cared to join the prosperous concourse of local sportsmen. He would probably be thrown a good deal amongst a somewhat lower, though no doubt energetic and intelligent, class of town companions. And they would devise together exploits which, if somewhat irregular, possessed the inspiring charm of freedom and novelty, and would thus be congenial to an ardent nature with a passionate interest in life and action. Such a nature would eagerly welcome enterprises with a dash of hazard and daring in them, fitted to bring the more resolute virtues into play, and develop in moments of emergency the manly qualities of vigilance and promptitude, courage and endurance, dexterity and skill. It would seem indeed at first sight as though a quiet neighborhood like Stratford could afford little scope for such adventures. But even at Stratford there were always the forest and the river, the outlying farms with adjacent parks and manor houses, the wide circle of picturesque towns and villages with their guilds and clubs, their local Shallows and Slenders, Dogberries and Verges; and in the most quiet neighborhoods it still remains true that adventures are to the adventurous. That this dictum was verified in Shakespeare's experience seems clear alike from the internal evidence of his writings and the concurrent testimony of local tradition. In its modern form the story of the Bidford challenge exploit may indeed be little better than a myth. But in substance it is by no means incredible, and if we knew all about the incident we should probably find there were other points to be tested between the rival companies besides strength of head to resist the effects of the well-known Bidford beer. The prompt refusal to return with his companions and renew the contest on the following day,—a decision playfully expressed and emphasized in the well-known doggerel lines,—implies that in Shakespeare's view such forms of good fellowship were to be accepted on social not self-indulgent grounds, that they were not to be resorted to for the sake of the lower accessories only, or allowed to grow into evil habits from being unduly repeated or prolonged. It is clear that this general principle of recreative and adventurous enterprise, announced more than once in his writings, guided his own conduct even in the excitable and impulsive season of youth and early manhood. If he let himself go, as he no doubt sometimes did, it was only as a good rider on coming to the turf gives the horse his head in order to enjoy the exhilaration of a gallop, having the bridle well in hand the while, and able to rein in the excited steed at a moment's notice. It may be said of Shakespeare at such seasons, as of his own Prince Hal, that he—

> "Obscur'd his contemplation
> Under the veil of wildness; which, no doubt,
> Grew like the summer grass, fastest by night,
> Unseen, yet crescive in his faculty."

Deer-stealing tradition.

The deer-stealing tradition illustrates the same point; and though belonging perhaps to a rather later period it may be conveniently noticed here. This fragment of Shakespeare's personal history rests on a much surer basis than the Bidford incident, being supported not only by early multiplied and constant traditions, but by evidence which the poet himself has supplied. Rowe's somewhat formal version of the narrative is to the effect that Shakespeare in his youth was guilty of an extravagance which, though unfortunate at the time, had the happy result of helping to develop his dramatic genius. This misfortune was that of being engaged with some of his companions more than once in robbing a park belonging to Sir Thomas Lucy, of Charlecote. Sir Thomas, it is said, prosecuted him sharply for the offence, and in retaliation he wrote a satirical ballad upon him, which so incensed the baronet that Shakespeare thought it prudent to leave Stratford and join his old friends and associates, the players in London. Other versions of the tradition exist giving fresh details, some of which are on the face of them later additions of a fictitious and fanciful kind. But it would be useless to discuss the accretions incident to any narrative, however true, orally transmitted through two or three generations before being reduced to a written shape. All that can be required or expected of such traditions is that they should contain a kernel of biographical fact, and be true in substance although possibly not in form. And tried by this test the tradition in question must certainly be accepted as a genuine contribution to our knowledge of the poet's early years. Indeed it could hardly have been repeated again and again by inhabitants of Stratford within a few years of Shakespeare's death if it did not embody a characteristic feature of his early life which was well known in the town. This feature was no doubt the poet's love of woodland life, and the woodland sports through which it is realized in the most animated and vigorous form.

The neighborhood of Stratford in Shakespeare's day afforded considerable scope for this kind of healthy recreation. There was the remnant of the old Arden forest, which, though still nominally a royal domain, was virtually free for many kinds of sport. Indeed, the observance of the forest laws had fallen into such neglect in the early years of Elizabeth's reign that even unlicensed deer-hunting in the royal domains was common enough. And hardly any attempt was made to prevent the pursuit of the smaller game belonging to the warren and the chase. Then, three or four miles to the east of Stratford, between the Warwick road and the river, stretched the romantic park of Fulbroke, which, as the property of an attainted exile, sequestered though not seized by the crown, was virtually open to all comers. There can be little doubt that when Shakespeare and his companions wished a day's outing in the woods they usually resorted to some part of the Arden forest still available for sporting purposes. But sometimes, probably on account of its greater convenience, they seem to have changed the venue to Fulbroke Park, and there they might easily come into collision with Sir Thomas Lucy's keepers. There has been a good deal of discussion as to the scene of the traditional adventure, but the probabilities of the case are strongly in favor of Fulbroke. When Sir Walter Scott visited Sir Thomas Lucy at Charlecote in 1828, Sir Thomas told him that the park from which Shakespeare stole the deer was not Charlecote, but one belonging to a mansion at some distance, the context indicating Fulbroke as the scene of the exploit. And Mr. Bracebridge, in his interesting pamphlet *Shakespeare no Deer-Stealer*, has thrown fresh light on the subject, and made the whole incident more intelligible by marshalling the reasons in favor of this view. The park had, it seems, been held by the Lucys under the crown in the time of Henry VIII., but was afterwards granted by Queen Mary to one of her privy councillors—Sir Francis Englefield. Being a devoted Romanist, he fled to Spain on the accession of Elizabeth and was subsequently adjudged a traitor, the Fulbroke estate being sequestered though not administered by the crown. The park being thus without a legal custodian for more than a quarter of a century became disparked, the palings having fallen into decay and the fences being in many places broken down. The deer with which it

abounded were thus left without any legal protection, and might be hunted at will by enterprising sportsmen. The only person likely to check this freedom or to attempt to do so was Sir Thomas Lucy, whose own park of Charlecote ran for a mile along the other side of the river just below Fulbroke. As the nearest large landed proprietor, having a direct interest in the state of the neighboring park, he might naturally think himself entitled to act as a kind of *ad interim* custodian of Fulbroke. And with his aristocratic feeling, his severe and exacting temper, he would be likely enough to push his temporary guardianship of custom or courtesy into an exclusive right, at least so far as the venison of the park was concerned. In any case Sir Thomas's keepers would occasionally perambulate Fulbroke Park as a protection to Charlecote, and in doing so they probably came upon Shakespeare and his companions after they had brought down a buck and were about to break it up for removal. Or the hunted deer may have crossed the river at the shallow ford between the two parks, and, pursued by the eager sportsmen, have been brought down within the Charlecote grounds. In either case the keepers would denounce the trespass, and possibly with menacing and abusive words demand the buck for their master. On being treated in this insulting way, Shakespeare, who had pride and personal dignity as well as courage, would deny any intentional or actual trespass, refuse to give up the venison, and plainly tell the keepers that they might report the matter to Sir Thomas Lucy and he would answer for himself and his companions. On finding what had happened, Sir Thomas would be all the more incensed and indignant from the consciousness that he had pushed his claims beyond the point at which they could legally be enforced. And, being to some extent in a false position, he would be proportionately wrathful and vindictive against the youthful sportsmen, and especially against their leader who had dared to resist and defy his authority. Sir Thomas was the great man of Stratford, who came periodically to the town on magistrate's business, was appealed to as arbitrator in special cases, and entertained by the corporation during his visits. In character he seems to have combined aristocratic pride and narrowness with the harshness and severity of the Puritan temper. As a landed proprietor and local magnate he was exacting and exclusive, looking with a kind of Puritanical sourness on all youthful frolics, merriment, and recreation. He would thus have a natural antipathy to young Shakespeare's free, generous, and enjoying nature, and would resent as an unpardonable outrage his high-spirited conduct in attempting to resist any claims he chose to make. Sir Thomas would no doubt vent his indignation to the authorities at Stratford, and try to set the law in motion, and failing in this might have threatened, as Justice Shallow does, to make a Star-Chamber matter of it. This was the kind of extreme course which a man in his position might take where there was no available local redress for any wrong he imagined himself to have suffered. And the Stratford authorities, being naturally anxious to propitiate the great man, may have suggested that it would be well if young Shakespeare could be out of the way for a time. This would help him to decide on the adoption of a plan already seriously entertained of going to London to push his fortune among the players.

Sir Thomas Lucy.

There is, however, another aspect in which this traditional incident may be looked at, which seems at least worthy of consideration. It is possible that Sir Thomas Lucy may have been prejudiced against the Shakespeares on religious grounds, and that this feeling may have prompted him to a display of exceptional severity against their eldest son. As we have seen, he was a narrow and extreme, a persecuting and almost fanatical Protestant, and several events had recently happened calculated to intensify his bitterness against the Romanists. In particular, Mary Shakespeare's family connections—the Ardens of Parkhall—had been convicted of conspiracy against the queen's life. The son-in-law of Edward Arden, John Somerville, a rash and "hot-spirited young gentleman," instigated by Hall, the family priest, had formed the design of going to London and assassinating Queen Elizabeth with his own hand. He started on his journey in November, 1583, but talked so incautiously by the way that he was arrested, conveyed to the Tower, and under a threat of the rack confessed everything, accusing his father-in-law as an accomplice and the priest as the instigator of the crime. All three were tried and convicted, their fate being probably hastened, as Dugdale states, by the animosity of Leicester against the Ardens. Somerville strangled himself in prison, and Edward Arden was hanged at Tyburn. These events produced a deep impression in Warwickshire, and no one in the locality would be more excited by them than Sir Thomas Lucy. His intensely vindictive feeling against the Romanists was exemplified a little later by his bringing forward a motion in parliament in favor of devising some new and lingering tortures for the execution of the Romanist conspirator Parry. As Mr. Froude puts it, "Sir Thomas Lucy,—Shakespeare's Lucy, the original perhaps of Justice Shallow, with an English fierceness at the bottom of his stupid nature,—having studied the details of the execution of Gerard, proposed in the House of Commons 'that some new law should be devised for Parry's execution, such as might be thought fittest for his extraordinary and horrible treason.'" The Ardens were devoted Romanists; the terrible calamity that had befallen the family occurred only a short time before the deer-stealing adventure; and the Shakespeares themselves, so far from being Puritans, were suspected by many of being but indifferent Protestants. John Shakespeare was an irregular attendant at church, and soon ceased to appear there at all, so that Sir Thomas Lucy probably regarded him as little better than a recusant. In any case Sir Thomas would be likely to resent the elder Shakespeare's convivial turn and profuse hospitality as alderman and bailiff, and especially his official patronage of the players and active encouragement of their dramatic representations in the guild hall. The Puritans had a rooted antipathy to the stage, and to the jaundiced eye of the local justice the reverses of the Shakespeares would probably appear as a judgment on their way of life. He would all the more eagerly seize any chance of humiliating their eldest son, who still held up his head and dared to look upon life as a scene of cheerful activity and occasional enjoyment. The young poet, indeed, embodied the very characteristics most opposed to Sir Thomas's dark and narrow conceptions of life and duty. His notions of public duty were very much restricted to persecuting the Romanists and preserving the game on Protestant estates. And Shakespeare probably took no pains to conceal his want of sympathy with these supreme objects of aristocratic and Puritanical zeal. And Sir Thomas, having at length caught him, as he imagined, in a technical trespass, would be sure to pursue the culprit with the unrelenting rigor of his hard and gloomy nature. But, whatever may have been the actual or aggravating circumstances of the original offence, there can be no doubt that an element of truth is contained in the deer-stealing tradition. The substantial facts in the story are that Shakespeare in his youth was fond of woodland sport, and that in one of his hunting adventures he came into collision with Sir Thomas Lucy's keepers, and fell under the severe ban of that local potentate. The latter point is indirectly confirmed by Shakespeare's inimitable sketch of the formal country justice in the *Second Part of Henry IV.* and the *Merry Wives of Windsor*,—Robert Shallow, Esq., being sufficiently identified with Sir Thomas Lucy by the pointed allusion to the coat of arms, as well as by other allusions of a more indirect but hardly less decisive kind. To talk of the sketch as an act of revenge is to treat it too seriously, or rather in too didactic and pedestrian a spirit. Having been brought into close relations with the justice, Shakespeare could hardly be expected to resist the temptation of turning to dramatic account so admirable a subject for humorous portraiture. The other point of the tradition, Shakespeare's fondness for woodland life, is supported by the internal evidence of his writings, and especially by the numerous allusions to the subject in his poems and earlier plays. The many references to woods and sports in the poems are well known; and in the early plays the allusions are not less frequent and in some

respects even more striking. Having no space, however, to give these in detail, a general reference must suffice. The entire action of *Love's Labor's Lost* takes place in a royal park, while the scene of the most critical events of the *Two Gentlemen of Verona* is a forest inhabited by generous outlaws whose offences appear to have been youthful follies, and who on being pardoned by the duke become his loyal followers. In these early plays it seems as though Shakespeare could hardly conceive of a royal palace or capital city without a forest close at hand as the scene of princely sport, criminal intrigue, or fairy enchantment. Outside the gates of Athens swept over hill and dale the wonderful forest which is the scene of the *Midsummer Night's Dream;* and in *Titus Andronicus* imperial Rome seems to be almost surrounded by the brightness and terror, the inspiring charm and sombre shades of rolling forest lawns and ravines, the "ruthless, vast, and gloomy woods."

Shakespeare's marriage.

There can be no doubt, therefore, that during the years of home life at Stratford Shakespeare was often in the forest. But in the latter part of the time he would be found still more frequently hastening through the fields to Shottery, paying long visits at the Hathaway farm, followed by late and reluctant leave-takings. For the next important fact in Shakespeare's history is his marriage with Anne Hathaway. This event, or rather the formal and ecclesiastical part of it, took place in the end of November, 1582, the bond for the license from the consistory court being dated on the 28th of the month. Mr. Halliwell-Phillipps has, however, sufficiently proved by detailed instances that the formal and public part of the ceremony would, according to the usage of the time, have been preceded some months earlier by the betrothal or pre-contract, which was in itself of legal validity. Shakespeare's marriage may therefore be dated from the summer of 1582, he being then in his nineteenth year, while his bride was between seven and eight years older. Many of the poet's biographers have assumed that the marriage was a hasty, unsuitable, and in its results an unhappy one. It is necessary therefore to repeat with all possible emphasis the well-founded statement of Mr. Halliwell-Phillipps that "there is not a particle of direct evidence" for either of these suppositions. The marriage could hardly have been a hasty one, for, as we have seen, the two families had been intimate for fifteen years, and Shakespeare had known Anne Hathaway from his early boyhood. As to whether it was suitable or not Shakespeare himself was the best and only adequate judge, and there is not, in the whole literature of the subject, even the shadow of a successful appeal against his decision. And, so far from the marriage having been unhappy, all the evidence within our reach goes to show that it was not only a union of mutual affection but a most fortunate event for the poet himself, as well as for the wife and mother who remained at the head of his family, venerated and loved by her children, and a devoted helpmate to her husband to the very end. Looking at the matter in its wider aspects, and especially in relation to his future career, it may be said that Shakespeare's early marriage gave him at the most emotional and unsettled period of life a fixed centre of affection and a supreme motive to prompt and fruitful exertion. This would have a salutary and steadying effect on a nature so richly endowed with plastic fancy and passionate impulse, combined with rare powers of reflective foresight and self-control. If Shakespeare's range and depth of emotional and imaginative genius had not been combined with unusual force of character and strength of ethical and artistic purpose, and these elements had not been early stimulated to sustained activity, he could never have had so great and uninterrupted a career. And nothing perhaps is a more direct proof of Shakespeare's manly character than the prompt and serious way in which, from the first, he assumed the full responsibility of his acts, and unflinchingly faced the wider range of duties they entailed. He himself has told us that

> "Love is too young to know what conscience is:
> Yet who knows not conscience is born of love?"

and it remains true that conscience, courage, simplicity, and nobleness of conduct are all, in generous natures, evoked and strengthened by the vital touch of that regenerating power. Shakespeare's whole course was changed by the new influence; and with his growing responsibilities his character seems to have rapidly matured, and his powers to have found fresh and more effective development. His first child Susanna was born in May, 1583, and, as she was baptized on the 26th, the day of her birth may have been the 23d, which would be exactly a month after her father completed his nineteenth year. In February, 1585, the family was unexpectedly enlarged by the birth of twins, a boy and a girl, who were named respectively Hamnet and Judith, after Hamnet and Judith Sadler, inhabitants of Stratford, who were lifelong friends of Shakespeare. Before he had attained his majority the poet had thus a wife and three children dependent upon him, with little opportunity or means apparently of advancing his fortunes in Stratford. The situation was in itself sufficiently serious. But it was complicated by his father's increasing embarrassments and multiplied family claims. Four children still remained in Henley Street to be provided for,—the youngest, Edmund, born in May, 1580, being scarcely five years old. John Shakespeare, too, was being sued by various creditors, and apparently in some danger of being arrested for debt. All this was enough to make a much older man than the poet look anxiously about him. But, with the unfailing sense and sagacity he displayed in practical affairs, he seems to have formed a sober and just estimate of his own powers, and made a careful survey of the various fields available for their remunerative exercise. As the result of his deliberations he decided in favor of trying the metropolitan stage and theatre. He had already tested his faculty of acting by occasional essays on the provincial stage; and, once in London amongst the players, where new pieces were constantly required, he would have full scope for the exercise of his higher powers as a dramatic poet. At the outset he could indeed only expect to discharge the lower function, but, with the growing popular demand for dramatic representations, the actor's calling, though not without its social drawbacks, was in the closing decades of the 16th century a lucrative one. Greene, in his autobiographical sketch *Never Too Late*, one of the most interesting of his prose tracts, illustrates this point in the account he gives of his early dealings with the players and experiences as a writer for the stage. Speaking through his hero Francesco, he says that "when his fortunes were at the lowest ebb he fell in amongst a company of players who persuaded him to try his wit in writing of comedies, tragedies, or pastorals, and if he could perform anything worth the stage, then they would largely reward him for his pains." Succeeding in the work, he was so well paid that he soon became comparatively wealthy, and went about with a well-filled purse. Although writing from the author's rather than the actor's point of view, Greene intimates that the players grew rapidly rich and were entitled both to praise and profit so long as they were "neither covetous nor insolent." In the *Return from Parnassus* (1601) the large sums, fortunes indeed, realized by good actors are referred to as matter of notoriety. One of the disappointed academic scholars, indeed, moralizing on the fact with some bitterness, exclaims:

> "England affords those glorious vagabonds,
> That carried erst their fardles on their backs,
> Coursers to ride on through the gazing streets,
> Sweeping it in their glaring satin suits,
> And pages to attend their masterships:
> With mouthing words that better wits have framed
> They purchase lands, and now esquires are made."

And in a humorous sketch entitled *Ratsei's Ghost*, and published in the first decade of the 17th century, an apparent reference to Shakespeare himself brings out the same point. The hero of the tract, Ratsey, a highwayman, having compelled a set of strolling players to act before him, advised their leader to leave the country and get to London, where, having a good presence for the stage and a turn for the work, he would soon fill his pockets, adding, "When thou feelest thy purse well-lined, buy thee some place of lordship in the country, that, growing weary of playing, thy money may bring thee dignity and reputation." The player, thanking him for his advice, replies, "I have heard indeed of some that have gone to London very meanly, who have in time become exceedingly wealthy." The movement to the London stage was therefore from a worldly point of view a prudent one, and for the higher purposes of Shakespeare's life it was equally wise and necessary. For besides the economic and practical considerations in favor of the step there must have pressed on the poet's mind the importance of a wider sphere of life and action for the enlargement of his inward horizon, and the effective development of his poetical and dramatic gifts.

Goes to London and becomes an actor.

The exact date of this event—of Shakspeare's leaving Stratford for London—cannot be fixed with any certainty. All the probabilities of the case, however, indicate that it must have taken place between the spring of 1585 and the autumn of 1587. In the latter year three of the leading companies visited Stratford, those belonging to the queen, Lord Leicester, and Lord Essex; and, as Lord Leicester's included three of Shakespeare's fellow townsmen,—Burbage, Heminge, and Greene,—it is not improbable that he may then have decided on trying his fortune in London. At the same time it is quite possible, and on some grounds even likely, that the step may have been taken somewhat earlier. But for the five years between 1587 and 1592 we have no direct knowledge of Shakspeare's movements at all, the period being a complete biographical blank, dimly illuminated at the outset by one or two doubtful traditions. We have indeed the assurance that after leaving Stratford he continued to visit his native town at least once every year; and if he had left it in 1586 we may confidently assume that he returned the next year for the purpose, amongst others, of consulting with his father and mother about the Asbies mortgage and of taking part with them in their action against John Lambert. His uniting with them in this action deserves special notice, as showing that he continued to take the keenest personal interest in all home affairs, and, although living mainly in London, was still looked upon, not only as the eldest son, but as the adviser and friend of the family. The anecdotes of Shakespeare's occupations on going to London, are, that at first he was employed in a comparatively humble capacity about the theatre, and that for a time he took charge of the horses of those who rode to see the plays, and was so successful in this work that he soon had a number of juvenile assistants who were known as Shakespeare's boys. Even in their crude form these traditions embody a tribute to Shakespeare's business promptitude and skill. If there is any truth in them they may be taken to indicate that while filling some subordinate post in the theatre Shakespeare perceived a defective point in the local arrangements, or heard the complaints of the mounted gallants as to the difficulty of putting up their horses. His provisions for meeting the difficulty seem to have been completely and even notoriously successful. There were open sheds or temporary stables in connection with the theatre in Shoreditch, and Shakespeare's boys, if the tradition is true, probably each took charge of a horse in these stables while its owner was at the play. But in any case this would be simply a brief episode in Shakespeare's multifarious employments when he first reached the scene of his active labors in London. He must soon have had more serious and absorbing professional occupations in the green room, on the stage, and in the laboratory of his own teeming brain, "the quick forge and working house of thought."

Continues his education.

But his leisure hours during his first years in London would naturally be devoted to continuing his education and equipping himself as fully as possible for his future work. It was probably during this time, as Mr. Halliwell-Phillipps suggests, that he acquired the working knowledge of French and Italian that his writings show he must have possessed. And it is perhaps now possible to point out the sources whence his knowledge of these languages was derived, or at least the master under whom he chiefly studied them. The most celebrated and accomplished teacher of French and Italian in Shakespeare's day was the resolute John Florio, who, after leaving Magdalen College, Oxford, lived for years in London, engaged in tutorial and literary work and intimately associated with eminent men of letters and their noble patrons. After the accession of James I., Florio was made tutor to Prince Henry, received an appointment about the court, became the friend and personal favorite of Queen Anne (to whom he dedicated the second edition of his Italian dictionary, entitled the *World of Words*), and died full of years and honors in 1625, having survived Shakespeare nine years. Florio had married the sister of Daniel the poet, and Ben Jonson presented a copy of *The Fox* to him with the inscription, "To his loving father and worthy friend Master John Florio, Ben Jonson seals this testimony of his friendship and love." Daniel writes a poem of some length in praise of his translation of Montaigne, while other contemporary poets contribute commendatory verses which are prefixed to his other publications. There are substantial reasons for believing that Shakespeare was also one of Florio's friends, and that during his early years in London he evinced his friendship by yielding for once to the fashion of writing this kind of eulogistic verse. Prefixed to Florio's *Second Fruits*, Prof. Minto discovered a sonnet so superior and characteristic that he was impressed with the conviction that Shakespeare must have written it. The internal evidence is in favor of this conclusion, while Mr. Minto's critical analysis and comparison of its thought and diction with Shakespeare's early work tends strongly to support the reality and value of the discovery. In his next work, produced four years later, Florio claims the sonnet as the work of a friend "who loved better to be a poet than to be called one," and vindicates it from the indirect attack of a hostile critic, H. S., who had also disparaged the work in which it appeared. There are other points of connection between Florio and Shakespeare. The only known volume that certainly belonged to Shakespeare and contains his autograph is Florio's version of Montaigne's *Essays* in the British Museum; and critics have from time to time produced evidence to show that Shakespeare must have read it carefully and was well acquainted with its contents. Victor Hugo in a powerful critical passage strongly supports this view. The most striking single proof of the point is Gonzalo's ideal republic in the *Tempest* which is simply a passage from Florio's version turned into blank verse. Florio and Shakespeare were both, moreover, intimate personal friends of the young earl of Southampton, who, in harmony with his generous character and strong literary tastes, was the munificent patron of each. Shakespeare, it will be remembered, dedicated his *Venus and Adonis* and his *Lucrece* to this young nobleman; and three years later, in 1598, Florio dedicated the first edition of his Italian dictionary to the earl in terms that almost recall Shakespeare's words. Shakespeare had said in addressing the earl, "What I have done is yours, what I have to do is yours, being part in all I have devoted yours." And

Connection with Florio.

Florio says, "In truth I acknowledge an entire debt, not only of my best knowledge, but of all, yea of more than I know or can to your bounteous lordship, most noble, most virtuous, and most honorable earl of Southampton, in whose pay and patronage I have lived some years, to whom I owe and vow the years I have to live." Shakespeare was also familiar with Florio's earlier works, his *First Fruits* and *Second Fruits*, which were simply carefully prepared manuals for the study of Italian, containing an outline of the grammar, a selection of dialogues in parallel columns of Italian and English, and longer extracts from classical Italian writers in prose and verse. We have collected various points of indirect evidence showing Shakespeare's familiarity with these manuals, but these being numerous and minute cannot be given here. It must suffice to refer in illustration of this point to a single instance —the lines in praise of Venice which Holofernes gives forth with so much unction in *Love's Labor's Lost*. The *First Fruits* was published in 1578, and was for some years the most popular manual for the study of Italian. It is the book that Shakespeare would naturally have used in attempting to acquire a knowledge of the language after his arrival in London ; and on finding that the author was the friend of some of his literary associates he would probably have sought his acquaintance and secured his personal help. As Florio was also a French scholar and habitually taught both languages, Shakespeare probably owed to him his knowledge of French as well as of Italian. If the sonnet is accepted as Shakespeare's work he must have made Florio's acquaintance within a year or two after going to London, as in 1591 he appears in the character of a personal friend and well-wisher. In any case Shakespeare would almost certainly have met Florio a few years later at the house of Lord Southampton, with whom the Italian scholar seems to have occasionally resided. It also appears that he was in the habit of visiting at several titled houses, amongst others those of the earl of Bedford and Sir John Harrington. It seems also probable that he may have assisted Harrington in his translation of Ariosto. Another and perhaps even more direct link connecting Shakespeare with Florio during his early years in London is found in their common relation to the family of Lord Derby. In the year 1585 Florio translated a letter of news from Rome, giving an account of the sudden death of Pope Gregory XIII. and the election of his successor. This translation, published in July, 1585, was dedicated "To the Right Excellent and Honorable Lord, Henry Earl of Derby," in terms expressive of Florio's strong personal obligations to the earl and devotion to his service. Three years later, on the death of Leicester in 1588, Lord Derby's eldest son Ferdinando Lord Strange became the patron of Leicester's company of players, which Shakespeare had recently joined. The new patron must have taken special interest in the company, as they soon became (chiefly through his influence) great favorites at court, superseding the Queen's players, and enjoying something like a practical monopoly of royal representations. Shakespeare would thus have the opportunity of making Florio's acquaintance at the outset of his London career, and everything tends to show that he did not miss the chance of numbering amongst his personal friends so accomplished a scholar, so alert, energetic, and original a man of letters, as the resolute John Florio. Warburton, it is well-known, had coupled Florio's name with Shakespeare in the last century. He suggested, or rather asserted, that Florio was the original of Holofernes in *Love's Labor's Lost*. Of all Warburton's arbitrary conjectures and dogmatic assumptions this is perhaps the most infelicitous. That a scholar and man of the world like Florio, with marked literary powers of his own, the intimate friend and associate of some of the most eminent poets of the day, living in princely and noble circles, honored by royal personages and welcomed at noble houses,—that such a man should be selected as the original of a rustic pedant and dominie like Holofernes, is surely the climax of guesswork and absurd suggestion. There is, it is true, a distant connection between Holofernes and Italy—the pedant being a well-known figure in the Italian comedies that obviously affected Shakespeare's early work. This usage calls forth a kind of sigh from the easy-going and tolerant Montaigne as he thinks of his early tutors and youthful interest in knowledge. "I have in my youth," he tells us, "oftentimes been vexed to see a pedant brought in in most of Italian comedies for a vice or sport-maker, and the nickname of magister (dominie) to be of no better signification amongst us." We may be sure that, if Shakespeare knew Florio before he produced *Love's Labor's Lost*, it was not as a sport-maker to be mocked at, but as a friend and literary associate to whom he felt personally indebted.

Italian studies.

But, whatever his actual relation to the Italian scholar may have been, Shakespeare, on reaching London and beginning to breathe its literary atmosphere, would naturally betake himself to the study of Italian. At various altitudes the English Parnassus was at that time fanned by soft airs, swept by invigorating breezes, or darkened by gloomy and infected vapors from the south. In other words, the influence of Italian literature, so dominant in England during the second half of the 16th century, may be said to have reached its highest point at the very time when Shakespeare entered on his poetic and dramatic labors. This influence was in part a revival of the strong impulse communicated to English literature from Italy in Chaucer's day. The note of the revival was struck in the title of Thomas's excellent Italian manual, "Principal rules of Italian grammar, with a dictionarie for the better understandyng of *Boccace*, *Petrarcha*, and *Dante*" (1550). The first fruits of the revival were the lyrical poems of Surrey and Wyatt, written somewhat earlier, but published for the first time in Tottle's *Miscellany* (1557). The sonnets of these poets—the first ever written in English—produced in a few years the whole musical choir of Elizabethan sonneteers. Surrey and Wyatt were sympathetic students of Petrarch, and, as Puttenham says, reproduced in their sonnets and love poems much of the musical sweetness, the tender and refined sentiment, of the Petrarchian lyric. This perhaps can hardly in strictness of speech be called a revival, for, strong as was the influence of Boccaccio, and in a less degree of Dante, during the first period of English literature, the lyrical poetry of the south, as represented by Petrarch, affected English poetry almost for the first time in the 16th century. This influence, as subsequently developed by Lyly in his prose comedies and romances, indirectly affected the drama, and clear traces of it are to be found in Shakespeare's own work. Surrey, however, rendered the Elizabethans a still greater service by introducing from Italy the unrhymed verse, which, with the truest instinct, was adopted by the great dramatists as the metrical vehicle best fitted to meet the requirements of the most flexible and expressive form of the poetic art. But, although in part the revival of a previous impulse, the Italian literature that most powerfully affected English poetry during the Elizabethan period was in the main new. During the interval the prolific genius of the south had put forth fresh efforts which combined, in new and characteristic products, the forms of classical poetry and the substance of southern thought and feeling with the spirit of mediæval romance. The chivalrous and martial epics of Ariosto and Tasso represented a new school of poetry which embraced within its expanding range every department of imaginative activity. There appeared in rapid succession romantic pastorals, romantic elegies, romantic satires, and romantic dramas, as well as romantic epics. The epics were occupied with marvels of knightly daring and chivalrous adventure, expressed in flowing and

melodious numbers: while the literature as a whole dealt largely in the favorite elements of ideal sentiment, learned allusion, and elaborate ornament, and was brightened at intervals by grave and sportive, by highly wrought but fanciful, pictures of courtly and Arcadian life. While Sidney and Spenser represented in England the new school of allegorical and romantic pastoral and epic, Shakespeare and his associates betook themselves to the study of the romantic drama and the whole dramatic element in recent and contemporary southern literature. The Italian drama proper, so far as it affected the form adopted by English playwrights, had indeed virtually done its work before any of Shakespeare's characteristic pieces were produced. His immediate predecessors, Greene, Peele, and Lodge, Nash, Kyd, and Marlowe, had all probably studied Italian models more carefully than Shakespeare himself ever did: and the result is seen in the appearance among these later Elizabethans of the romantic drama, which united the better elements of the English academic and popular plays with features of diction and fancy, incident and structure, that were virtually new. Many members of this dramatic group were, like Greene, good Italian scholars, had themselves travelled in Italy, knew the Italian stage at first hand, and, as their writings show, were well acquainted with recent Italian literature. But the dramatic element in that literature extended far beyond the circle of regular plays, whether tragedies, comedies, or pastorals. It included the collections of short prose stories which appeared, or were published for the first time in such numbers during the 16th century, the novels or novelettes of Ser Giovanni, Cinthio, Bandello, and their associates. These stories, consisting of the humorous and tragic incidents of actual life, told in a vivid and direct way, naturally attracted the attention of the dramatists. We know from the result that Shakespeare must have studied them with some care, as he derived from this source the plots and incidents of at least a dozen of his plays. Many of the stories, it is true, had already been translated, either directly from the Italian, or indirectly from French and Latin versions. Of Cinthio's hundred tales, however, only two or three are known to have been rendered into English; and Shakespeare derived the story of Othello from the untranslated part of this collection. Many of the Italian stories touched on darker crimes or more aggravated forms of violence than those naturally prompted by jealousy and revenge, and are indeed revolting from the atrocities of savage cruelty and lust related so calmly as to betray a kind of cynical insensibility to their true character. Shakespeare, however, with the sound judgment and strong ethical sense that guided the working of his dramatic genius, chose the better and healthier materials of this literature, leaving the morbid excesses of criminal passion to Webster and Ford. But the Italian influence on Shakespeare's work is not to be estimated merely by the outlines of plot and incident he borrowed from southern sources and used as a kind of canvas for his matchless portraiture of human character and action. It is apparent also in points of structure and diction, in types of character and shades of local coloring, which realize and express in a concentrated form the bright and lurid, the brilliant and passionate, features of southern life. The great majority of the *dramatis personæ* in his comedies, as well as in some of the tragedies, have Italian names, and many of them, such as Mercutio and Gratiano on the one hand, Iachimo and Iago on the other, are as Italian in nature as in name. The moonlight scene in the *Merchant of Venice* is southern in every detail and incident. And, as M. Philarète Chasles justly points out, *Romeo and Juliet* is Italian throughout, alike in coloring, incident, and passion. The distinctive influence is further traceable in Shakespeare's use of Italian words, phrases, and proverbs, some of which, such as "tranect" (from *tranare*), or possibly, as Rowe suggested "traject" (*traghetto*), are of special local significance. In the person of Hamlet Shakespeare even appears as a critic of Italian style. Referring to the murderer who in the players' tragedy poisons the sleeping duke, Hamlet exclaims, "He poisons him in the garden for his estate. His name's Gonzago; the story is extant and written in very choice Italian." In further illustration of this point Mr. Grant White has noted some striking turns of thought and phrase which seem to show that Shakespeare must have read parts of Berni and Ariosto in the original. No doubt in the case of Italian poets, as in the case of Latin authors like Ovid, whose works he was familiar with in the original, Shakespeare would also diligently read the translations, especially the translation into English verse. For in reading such works as Golding's Ovid, Harrington's Ariosto, and Fairfax's Tasso, he would be increasing his command over the elements of expressive phrase and diction which were the verbal instruments, the material vehicle, of his art. But, besides studying the translations of the Italian poets and prose writers made available for English readers, he would naturally desire to possess, and no doubt acquired for himself, the key that would unlock the whole treasure-house of Italian literature. The evidence of Shakespeare's knowledge of French is more abundant and decisive, so much so as hardly to need express illustration. There can be little doubt, therefore, that during his early years in London he acquired a fair knowledge both of French and Italian.

Early dramatic efforts.

But while pursuing these collateral aids to his higher work, there is abundant evidence that Shakespeare also devoted himself to that work itself. As early as 1592 he is publicly recognized, not only as an actor of distinction, but as a dramatist whose work had excited the envy and indignation of his contemporaries, and especially of one so accomplished and so eminent, so good a scholar and master of the playwright's craft, as Robert Greene. Greene had, it is true, a good deal of the irritability and excitable temper often found in the subordinate ranks of poetical genius, and he often talks of himself, his doings, and associates in a highly-colored and extravagant way. But his reference to Shakespeare is specially deliberate, being in the form of a solemn and last appeal to his friends amongst the scholarly dramatists to relinquish their connection with the presumptuous and ungrateful stage. In his *Groatsworth of Wit*, published by his friend Chettle a few weeks after his death, Greene urges three of his friends, apparently Marlowe, Lodge, and Peele, to give up writing for the players. "Base-minded men, all three of you, if by my misery ye be not warned; for unto none of you like me sought those burs to cleave; those puppets, I mean, who speak from our mouths, those anticks garnisht in our colours. Is it not strange that I, to whom they have all been beholding; is it not like that you, to whom they have all been beholding, shall (were ye in that case that I am now) be both of them at once forsaken? Yes, trust them not; for there is an upstart Crow, beautified in our feathers, that, with his *tiger's heart wrapt in a player's hide*, supposes he is as well able to bombast out a blank verse as the best of you, and, being an absolute *Johannes fac totum*, is, in his own conceit, the only Shakescene in a country. Oh that I might intreat your rare wits to be employed in more profitable courses, and let these apes imitate your past excellence, and never more acquaint them with your admired inventions." This curious passage tells us indirectly a good deal about Shakespeare. It bears decisive testimony to his assured position and rapid advance in his profession. The very term of reproach applied to him, "Johannes Factotum," is a tribute to Shakespeare's industry and practical ability. From the beginning of his career he must have been in the widest and best sense a utility man, ready to do any work connected with the theatre and stage, and emi-

nently successful in anything he undertook. In the first instance he had evidently made his mark as an actor, as it is in that character he is referred to by Greene, and denounced for going beyond his province and usurping the functions of the dramatist. Greene's words imply that Shakespeare not only held a foremost place as an actor, but that he was already distinguished by his dramatic success in revising and rewriting existing plays. This is confirmed by the parodied line from the *Third Part of Henry VI.* recently revised if not originally written by Shakespeare. This must have been produced before Greene's death which took place in September, 1592. Indeed, all the three parts of *Henry VI.* in the revised form appear to have been acted during the spring and summer of that year. It is not improbable that two or three of Shakespeare's early comedies may also have been produced before Greene's death. And if so, his resentment, as an academic scholar, against the country actor who had not only become a dramatist but had excelled Greene himself in his chosen field of romantic comedy becomes intelligible enough. Even in his wrath, however, Greene bears eloquent witness to Shakespeare's diligence, ability, and marked success, both as actor and playwright. All this is fully confirmed by the more deliberate and detailed language of Chettle's apology, already quoted. Of Shakespeare's amazing industry and conspicuous success the next few years supply ample evidence. Within six or seven years he not only produced the brilliant reflective and descriptive poems of *Venus and Adonis* and *Lucrece*, but at least fifteen of his dramas, including tragedies, comedies, and historical plays. Having found his true vocation, Shakespeare works during these years as a master, having full command over the materials and resources of his art. The dramas produced have a fulness of life and a richness of imagery, a sense of joyousness and power, that speak of the writer's exultant absorption and conscious triumph in his chosen work. The sparkling comedies and great historical plays belonging to this period evince the ease and delight of an exuberant mind realizing its matured creations.

Nor after all is this result so very surprising. Shakespeare entered on his London career at the very moment best fitted for the full development of his dramatic genius. From the accession of Elizabeth all the dominant impulses and leading events of her reign had prepared the way for the splendid triumph of policy and arms that closed its third decade, and for the yet more splendid literary triumph of the full-orbed drama that followed. After the gloom and terror of Mary's reign the coming of Elizabeth to the crown was hailed with exultation by the people, and seemed in itself to open a new and brighter page of the nation's history. Elizabeth's personal charms and mental gifts, her high spirit and dauntless courage, her unfailing political tact and judgment, her frank bearing and popular address, combined with her unaffected love for her people and devotion to their interests, awakened the strongest feelings of personal loyalty, and kindled into passionate ardor the spirit of national pride and patriotism that made the whole kingdom one. The most powerful movements of the time directly tended to reinforce and concentrate these awakened energies. While the Reformation and Renaissance impulses had liberalized men's minds and enlarged their moral horizon, the effect of both was at first of a political and practical rather than of a purely religious or literary kind. The strong and exhilarating sense of civil and religious freedom realized through the Reformation was inseparably associated with the exultant spirit of nationality it helped to stimulate and diffuse. The pope and his emissaries, the Jesuits, were looked upon far more as foreign enemies menacing the independence of the kingdom than as religious foes and firebrands seeking to destroy the newly established faith. The conspiracies, fomented from abroad, that gathered around the captive queen of Scots, the plots successively formed for the assassination of Elizabeth, were regarded as murderous assaults on the nation's life, and the Englishmen who organized them abroad or aided them at home were denounced and prosecuted with pitiless severity as traitors to their country. Protestantism thus came to be largely identified with patriotism, and all the active forces of the kingdom, its rising wealth, energy, and intelligence, were concentrated to defend the rights of the liberated empire against the assaults of despotic Europe represented by Rome and Spain. These forces gained volume and impetus as the nation was thrilled by the details of Alva's ruthless butcheries, and the awful massacre of St. Bartholomew, until at length they were organized and hurled with resistless effect against the grandest naval and military armament ever equipped by a Continental power,—an armament that had been sent forth with the assurance of victory by the wealthiest, most absolute, and most determined monarch of the time. There was a vigorous moral element in that national struggle and triumph. It was the spirit of freedom, of the energies liberated by the revolt from Rome, and illuminated by the fair humanities of Greece and Italy, that nerved the arm of that happy breed of men in the day of battle, and enabled them to strike with fatal effect against the abettors of despotic rule in church and state. The material results of the victory were at once apparent. England became mistress of the seas, and rose to an assured position in Europe as a political and maritime power of the first order. The literary results at home were equally striking. The whole conflict reacted powerfully on the genius of the race, quickening into life its latent seeds of reflective knowledge and wisdom, of poetical and dramatic art.

Conditions favorable to success.

Of these effects the rapid growth and development of the national drama was the most brilliant and characteristic. There was indeed at the time a unique stimulus in this direction. The greater number of the eager excited listeners who crowded the rude theatres from floor to roof had shared in the adventurous exploits of the age, while all felt the keenest interest in life and action. And the stage represented with admirable breadth and fidelity the struggling forces, the mingled elements, humorous and tragic, the passionate hopes, deep-rooted animosities, and fitful misgivings of those eventful years. The spirit of the time had made personal daring a common heritage: with noble and commoner, gentle and simple, alike, love of queen and country was a romantic passion, and heroic self-devotion at the call of either a beaten way of ordinary life. To act with energy and decision in the face of danger, to strike at once against any odds in the cause of freedom and independence, was the desire and ambition of all. This complete unity of national sentiment and action became the great characteristic of the time. The dangers threatening the newly liberated kingdom were too real and pressing to admit of anything like seriously divided councils, or bitterly hostile parties within the realm. Everything thus conspired to give an extraordinary degree of concentration and brilliancy to the national life. For the twenty years that followed the destruction of the Armada London was the centre and focus of that life. Here gathered the soldiers and officers who had fought against Spain in the Low Countries, against France in Scotland, and against Rome in Ireland. Along the river side, and in noble houses about the Strand, were the hardy mariners and adventurous sea captains, such as Drake, Hawkins, and Frobisher, who had driven their dauntless keels into unknown seas, who had visited strange lands and alien races in order to enlarge the knowledge, increase the dominions, and augment the wealth of their fellow-countrymen. Here assembled the noble councillors, scholars, and cavaliers whose foresight and skill guided the helm of state, whose accomplishment in letters and arms gave refinement and distinction to court pageants and cere-

Growth of the native drama.

monials, and whose patronage and support of the rising drama helped to make the metropolitan theatre the great centre of genius and art, the great school of historical teaching, the great mirror of human nature in all the breadth and emphasis of its interests, convictions, and activities. The theatre was indeed the living organ through which all the marvellous and mingled experiences of a time incomparably rich in vital elements found expression. There was no other, no organized or adequate means, of popular expression at all. Books were a solitary entertainment in the hands of few; newspapers did not exist; and the modern relief of incessant public meetings was, fortunately perhaps, an unknown luxury. And yet, amidst the plenitude of national life centred in London, the need for some common organ of expression was never more urgent or imperious. New and almost inexhaustible springs from the well-heads of intellectual life had for years been gradually fertilizing the productive English mind. The heroic life of the past, in clear outline and stately movement, had been revealed in the recovered masterpieces of Greece and Rome. The stores of more recent wisdom and knowledge, discovery and invention, science and art were poured continually into the literary exchequer of the nation, and widely diffused amongst eager and open-minded recipients. Under this combined stimulus the national intellect and imagination had already reacted fruitfully in ways that were full of higher promise. The material results of these newly awakened energies were, as we have seen, not less signal nor momentous. The number, variety, and power of the new forces thus acting on society effected in a short period a complete moral revolution. The barriers against the spread of knowledge and the spirit of free inquiry erected and long maintained by mediæval ignorance and prejudice were now thrown down. The bonds of feudal authority and Romish domination that had hitherto forcibly repressed the expanding national life were effectually broken. Men opened their eyes upon a new world which it was an absorbing interest and endless delight to explore,—a new world physically, where the old geographical limits had melted into the blue haze of distant horizons—a new world morally, where the abolition of alien dogma and priestly rule gave free play to fresh and vigorous social energies; and, above all, more surprising and mysterious than all, they opened their eyes with a strange sense of wonder and exultation on the new world of the emancipated human spirit. At no previous period had the popular curiosity about human life and human affairs been so vivid and intense. In an age of deeds so memorable, man naturally became the centre of interest, and the whole world of human action and passion, character and conduct, was invested with irresistible attraction. All ranks and classes had the keenest desire to penetrate the mysterious depths, explore the unknown regions, and realize as fully as might be the actual achievements and ideal possibilities of the nature throbbing with so full a pulse within themselves and reflected so powerfully in the world around them. Human nature, released from the oppression and darkness of the ages, and emerging with all its infinite faculties and latent powers into the radiant light of a secular day, was the new world that excited an admiration more profound and hopes far more ardent than any recently discovered lands beyond the sinking sun. At the critical moment Shakespeare appeared as the Columbus of that new world. Pioneers had indeed gone before and in a measure prepared the way, but Shakespeare still remains the great discoverer, occupying a position of almost lonely grandeur in the isolation and completeness of his work.

The theatres.

Never before, except perhaps in the Athens of Pericles, had all the elements and conditions of a great national drama met in such perfect union. As we have seen, the popular conditions supplied by the stir of great public events and the stimulus of an appreciative audience were present in exceptional force. With regard to the stage conditions,—the means of adequate dramatic representation,—public theatres had for the first time been recently established in London on a permanent basis. In 1574 a royal license had been granted by the queen to the earl of Leicester's company "to use, exercise, and occupy the art and faculty of playing Comedies, Tragedies, Interludes, and Stage Plays, and such other like as they have been already used and studied, as well for the recreation of our loving subjects as for our solace and pleasure when we shall think good to see them;" and, although the civil authorities resisted the attempt to establish a public theatre within the city, two or three were speedily erected just outside its boundaries, in the most convenient and accessible suburbs,—the Curtain and the Theatre in Shoreditch, beyond the northern boundary, and the Blackfriars theatre within the precincts of the dissolved monastery, just beyond the civic jurisdiction on the western side. A few years later other houses were built on the southern side of the river,—the Rose near the foot of London Bridge, and the Hope and Swan further afield. There was also at Newington Butts a place of recreation and entertainment for the archers and holiday people, with a central building which, like the circus at Paris Garden, was used during the summer months for dramatic purposes. These theatres were occupied by different companies in turn, and Shakespeare during his early years in London appears to have acted at several of them. But from his first coming up it seems clear that he was more identified with the earl of Leicester's players, of whom his energetic fellow townsman, James Burbage, was the head, than with any other group of actors. To Burbage indeed belongs the distinction of having first established public theatres as a characteristic feature of metropolitan life. His spirit and enterprise first relieved the leading companies from the stigma of being strolling players, and transferred their dramatic exhibitions, hitherto restricted to temporary scaffolds in the court-yards of inns and hostelries, to the more reputable stage and convenient appliances of a permanent theatre. In 1575 Burbage, having secured the lease of a piece of land at Shoreditch, erected there the house which proved so successful, and was known for twenty years as *the* Theatre, from the fact that it was the first ever erected in the metropolis. He seems also to have been concerned in the erection of a second theatre in the same locality called the Curtain; and later on, in spite of many difficulties, and a great deal of local opposition, he provided the more celebrated home of the rising drama known as the Blackfriars theatre. When Shakespeare went to London there were thus theatres on both sides of the water—the outlying houses being chiefly used during the summer and autumn months, while the Blackfriars, being roofed in and protected from the weather, was specially used for performances during the winter season. In spite of the persistent opposition of the lord mayor and city aldermen, the denunciations of Puritan preachers and their allies in the press, and difficulties arising from intermittent attacks of the plague and the occasional intervention of the court authorities, the theatres had now taken a firm root in the metropolis; and, strong in royal favor, in noble patronage, and above all in popular support, the stage had already begun to assume its higher functions as the living organ of the national voice, the many-colored mirror and reflection of the national life. A few years later the companies of players and the theatres they occupied were consolidated and placed on a still firmer public basis. For some years past, in addition to the actors really or nominally attached to noble houses, there had existed a body of twelve performers, selected by royal authority (in 1583) from different companies and known as the Queen's players. The earl of Leicester's, being the leading company, had naturally

furnished a number of recruits to the Queen's players, whose duty it was to act at special seasons before Her Majesty and the court. But within a few years after Shakespeare arrived in London the chief groups of actors were divided into two great companies, specially licensed and belonging respectively to the Lord Chamberlain and the Lord Admiral. Under the new arrangement the earl of Leicester's actors (who, as already stated, after the earl's death in 1588 found for a time a new patron in Lord Strange[1]) became the servants of the Lord Chamberlain. James Burbage had already retired from the company, his place being taken by his more celebrated son Richard Burbage, the Garrick of the Elizabethan stage, who acted with so much distinction and success all the great parts in Shakespeare's leading plays. In order that the Lord Chamberlain's company might have houses of their own both for summer and winter use, Richard Burbage, his brother Cuthbert, and their associates, including Shakespeare, undertook in 1599 to build a new theatre on the bank side, not far from the old Paris Garden circus. We know from a subsequent document, which refers incidentally to the building of this theatre, that the Burbages had originally introduced Shakespeare to the Blackfriars company. He had indeed proved himself so useful, both as actor and poet, that they were evidently glad to secure his future services by giving him a share as part proprietor in the Blackfriars property. The new theatre now built by the company was that known as the Globe, and it was for fifteen years, during the summer and autumn months, the popular and highly successful home of the Shakespearian drama. Three years earlier Richard Burbage and his associates had rebuilt the Blackfriars theatre on a more extended scale; and this well-known house divided with the Globe the honor of producing Shakespeare's later and more important plays. Shakespeare's position indeed of actor and dramatist is identified with these houses and with the Lord Chamberlain's company to which they belonged. On the accession of James I., this company, being specially favored by the new monarch, received a fresh royal charter, and the members of it were henceforth known as the King's servants. In the early years of Shakespeare's career the national drama had thus a permanent home in theatres conveniently central on either side of the river, and crowded during the summer and winter months by eager and excited audiences. Even before the building of the Globe, the house at Newington where three of Marlowe's most important plays and some of Shakespeare's early tragedies were produced, was often crowded to the doors. In the summer of 1592, when the *First Part of Henry VI.*, as revised by Shakespeare, was acted, the performance was so popular that, we are told by Nash, ten thousand spectators witnessed it in the course of a few weeks. It is true that even in the best theatres the appliances in the way of scenes and stage machinery were of the simplest description, change of scene being often indicated by the primitive device of a board with the name painted upon it. But players and playwrights, both arts being often combined in the same person, knew their business thoroughly well, and justly relied for success on the more vital attractions of powerful acting, vigorous writing, and practiced skill in the construction of their pieces. In the presence of strong passions expressed in kindling words and powerfully realized in living action, gesture, and incident, the absence of canvas sunlight and painted gloom was hardly felt. Or, as the stirring choruses in *Henry V.* show, the want of more elaborate and realistic scenery was abundantly supplied by the excited fancy, active imagination, and concentrated interest of the spectators.

The dramatic conditions of a national theatre were indeed, at the outset of Shakespeare's career, more complete, or rather in a more advanced state of development, than the playhouses themselves or their stage accessories. If Shakespeare was fortunate in entering on his London work amidst the full tide of awakened patriotism and public spirit, he was equally fortunate in finding ready to his hand the forms of art in which the rich and complex life of the time could be adequately expressed. During the decade in which Shakespeare left Stratford the playwright's art had undergone changes so important as to constitute a revolution in the form and spirit of the national drama. For twenty years after the accession of Elizabeth the two roots whence the English drama sprung—the academic or classical, and the popular, developed spontaneously in the line of mysteries, moralities, and interludes—continued to exist apart, and to produce their accustomed fruit independently of each other. The popular drama, it is true, becoming more secular and realistic, enlarged its area by collecting its materials from all sources,—from novels, tales, ballads, and histories, as well as from fairy mythology, local superstitions, and folklore. But the incongruous materials were, for the most part, handled in a crude and semi-barbarous way, with just sufficient art to satisfy the cravings and clamors of unlettered audiences. The academic plays, on the other hand, were written by scholars for courtly and cultivated circles, were acted at the universities, the inns of court, and at special public ceremonials, and followed for the most part the recognized and restricted rules of the classic drama. But in the third decade of Elizabeth's reign another dramatic school arose intermediate between the two elder ones, which sought to combine in a newer and higher form the best elements of both. The main impulse guiding the efforts of the new school may be traced indirectly to a classical source. It was due, not immediately to the masterpieces of Greece and Rome, but to the form which classical art had assumed in the contemporary drama of Italy, France, and Spain, especially of Italy, which was that earliest developed and best known to the new school of poets and dramatists. This southern drama, while academic in its leading features, had nevertheless modern elements blended with the ancient form. As the Italian epics, following in the main the older examples, were still charged with romantic and realistic elements unknown to the classical epic, so the Italian drama, constructed on the lines of Seneca and Plautus, blended with the severer form essentially romantic features. With the choice of heroic subjects, the orderly development of the plot, the free use of the chorus, the observance of the unities, and constant substitution of narrative for action were united the vivid coloring of poetic fancy and diction, and the use of materials and incidents derived from recent history and contemporary life. The influence of the Italian drama on the new school of English playwrights was, however, very much restricted to points of style and diction of rhetorical and poetical effect. It helped to produce among them the sense of artistic treatment, the conscious effort after higher and more elaborate forms and vehicles of imaginative and passionate expression. For the rest, the rising English drama, in spite of the efforts made by academic critics to narrow its range and limit its interests, retained and thoroughly vindicated its freedom and independence. The central characteristics of the new school are sufficiently explained by the fact that its leading representatives were all of them scholars and poets, living by their wits and gaining a somewhat precarious livelihood amidst the stir and bustle, the temptations and excitement, of concentrated London life. The distinctive note of their work is the reflex of their position as academic scholars working under poetic and popular impulses for the public theatres. The new and striking combination in their dramas of elements hitherto wholly separated is but the natural result of their attainments and literary

New school of dramatic art.

[1] This is maintained by Mr. Fleay in his recent *Life and Work of Shakespeare*. But the history of the early dramatic companies is so obscure that it is difficult to trace their changing fortunes with absolute certainty.

activities. From their university training and knowledge of the ancients they would be familiar with the technical requirements of dramatic art, the deliberate handling of plot, incident, and character, and the due subordination of parts essential for producing the effect of an artistic whole. Their imaginative and emotional sensibility, stimulated by their studies in Southern literature, would naturally prompt them to combine features of poetic beauty and rhetorical finish with the evolution of character and action; while from the popular native drama they derived the breadth of sympathy, sense of humor, and vivid contact with actual life which gave reality and power to their representations.

Leading members of the school.

The leading members of this group or school were Kyd, Greene, Lodge, Nash, Peele, and Marlowe, of whom in relation to the future development of the drama, Greene, Peele, and Marlowe are the most important and influential. They were almost the first poets and men of genius who devoted themselves to the production of dramatic pieces for the public theatres. But they all helped to redeem the common stages from the reproach their rude and boisterous pieces had brought upon them, and make the plays represented poetical and artistic as well as lively, bustling, and popular. Some did this rather from a necessity of nature and stress of circumstances than from any higher aim or deliberately formed resolve. But Marlowe, the greatest of them, avowed the redemption of the common stage as the settled purpose of his labors at the outset of his dramatic career. And during his brief and stormy life he nobly discharged the self-imposed task. His first play, *Tamburline the Great*, struck the authentic note of artistic and romantic tragedy. With all its extravagance, and over-straining after vocal and rhetorical effects, the play throbs with true passion and true poetry, and has throughout the stamp of emotional intensity and intellectual power. His later tragedies, while marked by the same features, bring into fuller relief the higher characteristics of his passionate and poetical genius. Alike in the choice of subject and method of treatment Marlowe is thoroughly independent, deriving little, except in the way of general stimulus, either from the classical or popular drama of his day. The signal and far-reaching reform he effected in dramatic metre by the introduction of modulated blank verse illustrates the striking originality of his genius. Gifted with a fine ear for the music of English numbers, and impatient of "the gigging veins of rhyming mother wits," he introduced the noble metre which was at once adopted by his contemporaries and became the vehicle of the great Elizabethan drama. The new metre quickly abolished the rhyming couplets and stanzas that had hitherto prevailed on the popular stage. The rapidity and completeness of this metrical revolution is in itself a powerful tribute to Marlowe's rare insight and feeling as a master of musical expression. The originality and importance of Marlowe's innovation are not materially affected by the fact that one or two classical plays, such as *Gorboduc* and *Jocasta*, had been already written in unrhymed verse. In any case these were private plays, and the monotony of cadence and structure in the verse excludes them from anything like serious comparison with the richness and variety of vocal effect produced by the skilful pauses and musical interlinking of Marlowe's heroic metre. Greene and Peele did almost as much for romantic comedy as Marlowe had done for romantic tragedy. Greene's ease and lightness of touch, his freshness of feeling and play of fancy, his vivid sense of the pathos and beauty of homely scenes and thorough enjoyment of English rural life, give to his dramatic sketches the blended charm of romance and reality hardly to be found elsewhere except in Shakespeare's early comedies. In special point of lyrical beauty and dramatic portraiture, such as his sketches of pure and devoted women and of witty and amusing clowns, Greene anticipated some of the more delightful and characteristic features of Shakespearian comedy. Peele's lighter pieces and Lyly's prose comedies helped in the same direction. Although not written for the public stage, Lyly's court comedies were very popular, and Shakespeare evidently gained from their light and easy if somewhat artificial tone, their constant play of witty banter and sparkling repartee, valuable hints for the prose of his own comedies. Marlowe again prepared the way for another characteristic development of Shakespeare's dramatic art. His *Edward II.* marks the rise of the historical drama, as distinguished from the older chronicle play, in which the annals of a reign or period were thrown into a series of loose and irregular metrical scenes. Peele's *Edward I.*, Marlowe's *Edward II.*, and the fine anonymous play of *Edward III.*, in which many critics think Shakespeare's hand may be traced, show how thoroughly the new school had felt the rising national pulse, and how promptly it responded to the popular demand for the dramatic treatment of history. The greatness of contemporary events had created a new sense of the grandeur and continuity of the nation's life, and excited amongst all classes a vivid interest in the leading personalities and critical struggles that had marked its progress. There was a strong and general feeling in favor of historical subjects, and especially historical subjects having in them elements of tragical depth and intensity. Shakespeare's own early plays—dealing with the distracted reign of King John, the Wars of the Roses, and the tragical lives of Richard II. and Richard III.—illustrate this bent of popular feeling. The demand being met by men of poetical and dramatic genius reacted powerfully on the spirit of the age, helping in turn to illuminate and strengthen its loyal and patriotic sympathies.

Superiority of the English stage.

This is in fact the key-note of the English stage in the great period of its development. It was its breadth of national interest and intensity of tragic power that made the English drama so immeasurably superior to every other contemporary drama in Europe. The Italian drama languished because, though carefully elaborated in point of form, it had no fulness of national life, no common elements of ethical conviction or aspiration, to vitalize and ennoble it. Even tragedy, in the hands of Italian dramatists, had no depth of human passion, no energy of heroic purpose, to give higher meaning and power to its evolution. In Spain the dominant courtly and ecclesiastical influences limited the development of the national drama, while in France it remained from the outset under the artificial restrictions of classical and pseudo-classical traditions. Shakespeare's predecessors and contemporaries, in elevating the common stages, and filling them with poetry, music, and passion, had attracted to the theatre all classes, including the more cultivated and refined; and the intelligent interest, energetic patriotism, and robust life of so representative an English audience supplied the strongest stimulus to the more perfect development of the great organ of national expression. The forms of dramatic art in the three main departments of comedy, tragedy, and historical drama, had been, as we have seen, clearly discriminated and evolved in their earlier stages. It was a moment of supreme promise and expectation, and in the accidents of earth, or, as we may more appropriately and gratefully say, in the ordinances of heaven, the supreme poet and dramatist appeared to more than fulfil the utmost promise of the time. By right of imperial command over all the resources of imaginative insight and expression Shakespeare combined the rich dramatic materials already prepared into more perfect forms, and carried them to the highest point of ideal development. He quickly surpassed Marlowe in passion, music, and intellectual power; Greene in lyrical beauty, elegiac grace, and narrative interest; Peele in

picturesque touch and pastoral sweetness; and Lyly in bright and sparkling dialogue. And having distanced the utmost efforts of his predecessors and contemporaries he took his own higher way, and reigned to the end without a rival in the new world of supreme dramatic art he had created. It is a new world, because Shakespeare's work alone can be said to possess the organic strength and infinite variety, the throbbing fulness, vital complexity, and breathing truth, of nature herself. In points of artistic resource and technical ability—such as copious and expressive diction, freshness and pregnancy of verbal combination, richly modulated verse, and structural skill in the handling of incident and action—Shakespeare's supremacy is indeed sufficiently assured. But, after all, it is of course in the spirit and substance of his work his power of piercing to the hidden centres of character, of touching the deepest springs of impulse and passion, out of which are the issues of life, and of evolving those issues dramatically with a flawless strength, subtlety and truth, which raises him so immensely above and beyond not only the best of the playwrights who went before him, but the whole line of illustrious dramatists that came after him. It is Shakespeare's unique distinction that he has an absolute command over all the complexities of thought and feeling that prompt to action and bring out the dividing lines of character. He sweeps with the hand of a master the whole gamut of human experience, from the lowest note to the very top of its compass, from the sportive childish treble of Mamilius and the pleading boyish tones of Prince Arthur, up to the spectre-haunted terrors of Macbeth, the tropical passion of Othello, the agonized sense and tortured spirit of Hamlet, the sustained elemental grandeur, the Titanic force and utterly tragical pathos of Lear.

Shakespeare's dramatic career—first period.

Shakespeare's active dramatic career in London lasted about twenty years, and may be divided into three tolerably symmetrical periods. The first extends from the year 1587 to about 1593–94; the second from this date to the end of the century; and the third from 1600 to about 1608, soon after which time Shakespeare ceased to write regularly for the stage, was less in London and more and more at Stratford. Some modern critics add to these a fourth period, including the few plays which from internal as well as external evidence must have been among the poet's latest productions. As the exact dates of these plays are unknown, this period may be taken to extend from 1608 to about 1612. The three dramas produced during these years are, however, hardly entitled to be ranked as a separate period. They may rather be regarded as supplementary to the grand series of dramas belonging to the third and greatest epoch of Shakespeare's productive power. To the first period belong Shakespeare's early tentative efforts in revising and partially rewriting plays produced by others that already had possession of the stage. These efforts are illustrated in the three parts of *Henry VI.*, especially the second and third parts, which bear decisive marks of Shakespeare's hand, and were to a great extent recast and rewritten by him. It is clear from the internal evidence thus supplied that Shakespeare was at first powerfully affected by "Marlowe's mighty line." This influence is so marked in the revised second and third parts of *Henry VI.* as to induce some critics to believe Marlowe must have had a hand in the revision. These passages are, however, sufficiently explained by the fact of Marlowe's influence during the first period of Shakespeare's career. To the same period also belong the earliest tragedy, that of *Titus Andronicus*, and the three comedies—*Love's Labor's Lost*, *The Comedy of Errors*, and the *Two Gentlemen of Verona*. These dramas are all marked by the dominant literary influences of the time. They present features obviously due to the revived and widespread knowledge of classical literature, as well as to the active interest in the literature of Italy and the South. *Titus Andronicus*, in many of its characteristic features, reflects the form of Roman tragedy almost universally accepted and followed in the earlier period of the drama. This form was supplied by the Latin plays of Seneca, their darker colors being deepened by the moral effect of the judicial tragedies and military conflicts of the time. The execution of the Scottish queen and the Catholic conspirators who had acted in her name, and the destruction of the Spanish Armada, had given an impulse to tragic representations of an extreme type. This was undoubtedly rather fostered than otherwise by the favorite exemplars of Roman tragedy. The *Medea* and *Thyestes* of Seneca are crowded with pagan horrors of the most revolting kind. It is true these horrors are usually related, not represented, although in the *Medea* the maddened heroine kills her children on the stage. But from these tragedies the conception of the physically horrible as an element of tragedy was imported into the early English drama, and intensified by the realistic tendency which the events of the time and the taste of their ruder audiences had impressed upon the common stages. This tendency is exemplified in *Titus Andronicus*, obviously a very early work, the signs of youthful effort being apparent not only in the acceptance of so coarse a type of tragedy but in the crude handling of character and motive, and the want of harmony in working out the details of the dramatic conception. Kyd was the most popular contemporary representative of the bloody school, and in the leading motives of treachery, concealment, and revenge there are points of likeness between *Titus Andronicus* and the *Spanish Tragedy*. But how promptly and completely Shakespeare's nobler nature turned from this lower type is apparent from the fact that he not only never reverted to it but indirectly ridicules the piled-up horrors and extravagant language of Kyd's plays.

The early comedies in the same way are marked by the dominant literary influences of the time, partly classic partly Italian. In the *Comedy of Errors*, for example, Shakespeare attempted a humorous play of the old classical type, the general plan and many details being derived directly from Plautus. In *Love's Labor's Lost* many characteristic features of Italian comedy are freely introduced: the pedant Holofernes, the curate Sir Nathaniel, the fantastic braggadocio soldier Armado, are all well-known characters of the contemporary Italian drama. Of this comedy, indeed, Gervinus says, "the tone of the Italian school prevails here more than in any other play. The redundance of wit is only to be compared with a similar redundance of conceit in Shakespeare's narrative poems, and with the Italian style which he had early adopted." These comedies display another sign of early work in the mechanical exactness of the plan and a studied symmetry in the grouping of the chief personages of the drama. In the *Two Gentlemen of Verona*, as Prof. Dowden points out, "Proteus the fickle is set against Valentine the faithful, Silvia the light and intellectual against Julia the ardent and tender, Launce the humorist against Speed the wit." So in *Love's Labor's Lost*, the king and his three fellow-students balance the princess and her three ladies, and there is a symmetrical play of incident between the two groups. The arrangement is obviously more artificial than spontaneous, more mechanical than vital and organic. But towards the close of the first period Shakespeare had fully realized his own power and was able to dispense with these artificial supports. Indeed, having rapidly gained knowledge and experience, he had before the close written plays of a far higher character than any which even the ablest of his contemporaries had produced. He had firmly laid the foundation of his future fame in the direction both of comedy and tragedy, for, besides the comedies already referred to, the first sketches of *Hamlet* and *Romeo and Juliet*, and the tragedy of *Richard III.*, may probably be referred to this period.

Another mark of early work belonging to these dramas is the lyrical and elegiac tone and treatment associated with the use of rhyme, of rhyming couplets and stanzas. Spenser's musical verse had for the time elevated the character of rhyming metres by identifying them with the highest kinds of poetry, and Shakespeare was evidently at first affected by this powerful impulse. He rhymed with great facility, and delighted in the gratification of his lyrical fancy and feeling which the more musical rhyming metres afforded. Rhyme accordingly has a considerable and not inappropriate place in the earlier romantic comedies. The *Comedy of Errors* has indeed been described as a kind of lyrical farce in which the opposite qualities of elegiac beauty and comic effect are happily blended. Rhyme, however, at this period of the poet's work is not restricted to the comedies. It is largely used in the tragedies and histories as well, and plays even an important part in historical drama so late as *Richard II.* Shakespeare appears, however, to have worked out this favorite vein, and very much taken leave of it, by the publication of his descriptive and narrative poems, the *Venus and Adonis* and the *Lucrece;* although the enormous popularity of these poems might almost have tempted him to return again to the abandoned metrical form. The only considerable exception to the disuse of rhyming metres and lyrical treatment is supplied by the *Sonnets*, which though not published till 1609, were probably begun early, soon after the poems, and written at intervals during eight or ten of the intervening years. Into the many vexed questions connected with the history and meaning of these poems it is impossible to enter. The attempts recently made by the Rev. W. A. Harrison and Mr. T. Tyler to identify the "dark lady" of the later sonnets, while of some historical interest, cannot be regarded as successful. And the identification, even if rendered more probable by the discovery of fresh evidence, would not clear up the difficulties, biographical, literary, and historical, connected with these exquisite poems. It is perhaps enough to say with Prof. Dowden that in Shakespeare's case the most natural interpretation is the best, and that, so far as they throw light on his personal character, the sonnets show that "he was capable of measureless personal devotion; that he was tenderly sensitive, sensitive above all to every diminution or alteration of that love his heart so eagerly craved: and that, when wronged, although he suffered anguish, he transcended his private injury and learned to forgive."

Second period.

Whatever question may be raised with regard to the superiority of some of the plays belonging to the first period of Shakespeare's dramatic career, there can be no question at all as to any of the pieces belonging to the second period, which extends to the end of the century. During these years Shakespeare works as a master, having complete command over the materials and resources of the most mature and flexible dramatic art. "To this stage," says Mr. Swinburne, "belongs the special faculty of faultless, joyous, facile command upon each faculty required of the presiding genius for service or for sport. It is in the middle period of his work that the language of Shakespeare is most limpid in its fulness, the style most pure, the thought most transparent through the close and luminous raiment of perfect expression." This period includes the magnificent series of historical plays—*Richard II.*, the two parts of *Henry IV.*, and *Henry V.*—and a double series of brilliant comedies. The *Midsummer Night's Dream*, *All's Well that ends Well*, and the *Merchant of Venice* were produced before 1598, and during the next three years there appeared a still more complete and characteristic group including *Much ado about Nothing*, *As you Like it*, and *Twelfth Night*. These comedies and historical plays are all marked by a rare harmony of reflective and imaginative insight, perfection of creative art, and completeness of dramatic effect. Before the close of this period, in 1598, Francis Meres paid his celebrated tribute to Shakespeare's superiority in lyrical, descriptive, and dramatic poetry, emphasizing his unrivalled distinction in the three main departments of the drama,—comedy, tragedy, and historical play. And from this time onwards the contemporary recognitions of Shakespeare's eminence as a poet and dramatist rapidly multiply, the critics and eulogists being in most cases well entitled to speak with authority on the subject.

Third period.

In the third period of Shakespeare's dramatic career years had evidently brought enlarged vision, wider thoughts, and deeper experiences. While the old mastery of art remains, the works belonging to this period seem to bear traces of more intense moral struggles, larger and less joyous views of human life, more troubled, complex, and profound conceptions and emotions. Comparatively few marks of the lightness and animation of the earlier works remain, but at the same time the dramas of this period display an unrivalled power of piercing the deepest mysteries and sounding the most tremendous and perplexing problems of human life and human destiny. To this period belong the four great tragedies—*Hamlet*, *Macbeth*, *Othello*, *Lear;* the three Roman plays—*Coriolanus*, *Julius Cæsar*, *Anthony and Cleopatra;* the two singular plays whose scene and personages are Greek but whose action and meaning are wider and deeper than either Greek or Roman life—*Troilus and Cressida* and *Timon of Athens;* and one comedy—*Measure for Measure*, which is almost tragic in the depth and intensity of its characters and incidents. The four great tragedies represent the highest reach of Shakespeare's dramatic power, and they sufficiently illustrate the range and complexity of the deeper problems that now occupied his mind. *Timon* and *Measure for Measure*, however, exemplify the same tendency to brood with meditative intensity over the wrongs and miseries that afflict humanity. These works sufficiently prove that during this period Shakespeare gained a disturbing insight into the deeper evils of the world, arising from the darker passions, such as treachery and revenge. But it is also clear that, with the larger vision of a noble, well-poised nature, he at the same time gained a fuller perception of the deeper springs of goodness in human nature, of the great virtues of invincible fidelity and unwearied love, and he evidently received not only consolation and calm but new stimulus and power from the fuller realization of these virtues. The typical plays of this period thus embody Shakespeare's ripest experience of the great issues of life. In the four grand tragedies the central problem is a profoundly moral one. It is the supreme internal conflict of good and evil amongst the central forces and higher elements of human nature, as appealed to and developed by sudden and powerful temptation, smitten by accumulated wrongs, or plunged in overwhelming calamities. As the result, we learn that there is something infinitely more precious in life than social ease or worldly success—nobleness of soul, fidelity to truth and honor, human love and loyalty, strength and tenderness, and trust to the very end. In the most tragic experiences this fidelity to all that is best in life is only possible through the loss of life itself. But when Desdemona expires with a sigh and Cordelia's loving eyes are closed, when Hamlet no more draws his breath in pain and the tempest-tossed Lear is at last liberated from the rack of this tough world, we feel that, death having set his sacred seal on their great sorrows and greater love, they remain with us as possessions forever. In the three dramas belonging to Shakespeare's last period, or rather which may be said to close his dramatic career, the same feeling of severe but consolatory calm is still more apparent. If the deeper discords of life are not finally resolved, the virtues which soothe their perplexities and give us courage and endurance to wait, as well as confidence to trust the final issues,—the virtues of forgiveness and generosity, of forbearance and

self-control,—are largely illustrated. This is a characteristic feature in each of these closing dramas, in the *Winter's Tale*, *Cymbeline*, and the *Tempest*. The *Tempest* is supposed, on tolerably good grounds, to be Shakespeare's last work, and in it we see the great magician, having gained by the wonderful experience of life, and the no less wonderful practice of his art, serene wisdom, clear and enlarged vision, and beneficent self-control, break his magical wand and retire from the scene of his triumphs to the home he had chosen amidst the woods and meadows of the Avon, and surrounded by the family and friends he loved.

Later personal history.

We must now briefly summarize the few remaining facts of the poet's personal history. The year 1596 was marked by considerable family losses. In August Shakespeare's only son Hamnet died in the twelfth year of his age. With his strong domestic affections and cherished hopes of founding a family, the early death of his only boy must have been for his father a severe blow. It was followed in December by the death of Shakespeare's uncle Henry, the friend of his childhood and youth, the protector and encourager of his boyish sports and enterprises at Bearley, Snitterfield, and Fulbroke. A few months later the Shakespeare household at Snitterfield, so intimately associated for more than half a century with the family in Henley Street, was finally broken up by the death of the poet's aunt Margaret, his uncle Henry's widow. Although the death of his son and heir had diminished the poet's hope of founding a family, he did not in any way relax his efforts to secure a permanent and comfortable home for his wife and daughters at Stratford. As early as 1597, when he had pursued his London career for little more than ten years, he had saved enough to purchase the considerable dwelling-house in New Place, Stratford, to which he afterwards retired. This house, originally built by Sir Hugh Clopton and called the "Great House," was one of the largest mansions in the town, and the fact of Shakespeare having acquired such a place as his family residence would at once increase his local importance. From time to time he made additional purchases of land about the house and in the neighborhood. In 1602 he largely increased the property by acquiring 107 acres of arable land, and later on he added to this 20 acres of pasture land, with a convenient cottage and garden in Chapel Lane, opposite the lower grounds of the house. Within a few years his property thus comprised a substantial dwelling-house with large garden and extensive outbuildings, a cottage fronting the lower road, and about 137 acres of arable and pasture land. During these years Shakespeare made another important purchase that added considerably to his income. From the letter of a Stratford burgess to a friend in London, it appears that as early as 1597 Shakespeare had been making inquiry about the purchase of tithes in the town and neighborhood. And in 1605 he bought the unexpired lease of tithes, great and small, in Stratford and two adjoining hamlets, the lease having still thirty years to run. This purchase yielded him an annual income of £38 a year, equal to upwards of £350 [$1700] a year of our present money. The last purchase of property made by Shakespeare of which we have any definite record is at once so interesting and so perplexing as to have stimulated various conjectures on the part of his biographers. This purchase carries us away from Stratford back to London, to the immediate neighborhood of Shakespeare's dramatic labors and triumphs. It seems that in March, 1613, he bought a house with a piece of ground attached to it a little to the southwest of St. Paul's cathedral, and not far from the Blackfriars theatre. The purchase of this house in London after he had been for some years settled at Stratford has led some critics to suppose that Shakespeare had not given up all thought of returning to the metropolis, or at least of spending part of the year there with his family in the neighborhood he best knew and where he was best known. The ground of this supposition is, however, a good deal destroyed by the fact that soon after acquiring this town house Shakespeare let it for a lease of ten years. He may possibly have bought the property as a convenience to some of his old friends who were associated with him in the purchase. In view of future contingencies it would obviously be an advantage to have a substantial dwelling so near the theatre in the hands of a friend. It was indeed by means of a similar purchase that James Burbage had originally started and established the Blackfriars theatre.

The year 1607–8 would be noted in Shakespeare's family calendar as one of vivid and chequered domestic experiences. On the 5th of June his eldest daughter Susanna, who seems to have inherited something of her father's genius, was married to Dr. John Hall, a medical man of more than average knowledge and ability, who had a considerable practice in the neighborhood of Stratford, and who was deservedly held in high repute. The newly married couple settled in one of the picturesque houses of the wooded suburb between the town and the church known as Old Stratford. But before the end of the year the midsummer marriage bells had changed to sadder music. In December Shakespeare lost his youngest brother, Edmund, at the early age of twenty-seven. He had become an actor, most probably through his brother's help and influence, and was, at the time of his death, living in London. He was buried at Southwark on the last day of the year. Two months later there was family rejoicing in Dr. Hall's house at the birth of a daughter, christened Elizabeth, the only offspring of the union, and the only grandchild Shakespeare lived to see. The rejoicing at this event would be fully shared by the household in New Place, and especially by Shakespeare himself, whose cherished family hopes would thus be strengthened and renewed. Six months later in this eventful year, fortune again turned her wheel. Early in September Shakespeare's mother, Mary Arden of the Asbies, died, having lived long enough to see and welcome her great grandchild as a fresh bond of family life. She was buried at Stratford on the 9th of September, having survived her husband, who was buried on the 8th of September, 1601, exactly seven years. Mary Shakespeare died full of years and honor and coveted rewards. For more than a decade she had witnessed and shared the growing prosperity of her eldest son, and felt the mother's thrill of joy and pride in the success that had crowned his brilliant career. The loss of his mother would be deeply felt by her favorite son, but there was no bitterness in the bereavement, and it even seems to have exerted a tranquillizing, elevating effect on the poet's mind and character. As he laid her in the grave he would recall and realize afresh the early years during which her loving presence and influence were the light and guide of his boyish life. With these vivid and varied family experiences a strong wave of home-yearning seems to have set in, which gradually drew the poet wholly back to Stratford. During the autumn visit connected with his mother's death Shakespeare must have remained several weeks at the New Place, for on the 16th of October he acted as godfather to the infant son of an old personal friend, Henry Walker, who was an alderman of the borough. The child was called William after his godfather, and the poet must have taken a special interest in the boy, as he remembered him in his will.

Retires to Stratford.

It seems most probable that soon after the chequered domestic events of this year, as soon as he could conveniently terminate his London engagements, Shakespeare decided on retiring to his native place. He had gained all he cared for in the way of wealth and fame, and his strongest interests, personal and relative, were now centred in Stratford. But on retiring to settle in his native town he had nothing of the dreamer, the sentimentalist, or the recluse about him. His healthy natural feeling

was far too strong, his character too manly and well-balanced, to admit of any of the so-called eccentricities of genius. He retired as a successful professional man who had gained a competence by his own exertions and wished to enjoy it at leisure in a simple, social, rational way. He knew that the competence he had gained, the lands and wealth he possessed, could only be preserved, like other valuable possessions, by good management and careful husbandry. And, taught by the sad experience of his earlier years, he evidently guided the business details of his property with a firm and skilful hand, was vigilant and scrupulously just in his dealings, respecting the rights of others, and, if need be, enforcing his own. He sued his careless and negligent debtors in the local court of record, had various commercial transactions with the corporation, and took an active interest in the affairs of the borough. And he went now and then to London, partly on business connected with the town, partly no doubt to look after the administration and ultimate disposal of his own theatrical property, and partly it may be assumed for the pleasure of seeing his old friends and fellow dramatists. Even at Stratford, however, Shakespeare was not entirely cut off from his old associates in arts and letters, his hospitable board being brightened at intervals by the presence, and animated by the wit, humor, and kindly gossip, of one or more of his chosen friends. Two amongst the most cherished of his companions and fellow poets, Drayton and Ben Jonson, had paid a visit of this kind to Stratford, and been entertained by Shakespeare only a few days before his death, which occurred almost suddenly on the 23d of April, 1616. After three days' illness the great poet was carried off by a sharp attack of fever, at that time one of the commonest scourges, even of country towns, and often arising then as now, only more frequently then than now, from the neglect of proper sanitary precautions. According to tradition the 23d of April was Shakespeare's birthday, so that he died on the completion of the 52d year of his age. Three days later he was laid in the chancel of Stratford church, on the north wall of which his monument, containing his bust and epitaph, was soon afterwards placed, most probably by the poet's son-in-law, Dr. John Hall. Shakespeare's widow, the Anne Hathaway of his youth, died in 1623, having survived the poet seven years, exactly the same length of time that his mother Mary Arden had outlived her husband. Elizabeth Hall, the poet's grandchild, was married twice, first to Mr. Thos. Nash of Stratford, and in 1649, when she had been two years a widow, to Mr. afterwards Sir John Barnard of Abington in Northamptonshire. Lady Barnard had no family by either husband, and the three children of the poet's second daughter Judith (who had married Richard Quiney of Stratford, two months before her father's death) all died comparatively young. At Lady Barnard's death in 1670 the family of the poet thus became extinct. By his will made a few weeks before his death Shakespeare left his landed property, the whole of his real estate indeed, to his eldest daughter Mrs. Susanna Hall, under strict entail to her heirs. He left also a substantial legacy to his second daughter and only remaining child Mrs. Judith Quiney, and a remembrance to several of his friends, including his old associates at the Blackfriars theatre, Burbage, Heminge, and Condell,—the two latter of whom edited the first collection of his dramas published in 1623. The will also included a bequest to the poor of Stratford.

Summary of life and character

From this short sketch it will be seen that all the best known facts of Shakespeare's personal history bring into vivid relief the simplicity and naturalness of his tastes, his love of the country, the strength of his domestic affections, and the singularly firm hold which the conception of family life had upon his imagination, his sympathies, and his schemes of active labor. He had loved the country with ardent enthusiasm in his youth, when all nature was lighted with the dawn of rising passion and kindled imagination; and after his varied London experience we may well believe that he loved it still more with a deeper and calmer love of one who had looked through and through the brilliant forms of wealthy display, public magnificence, and courtly ceremonial, who had scanned the heights and sounded the depths of existence, and who felt that for the king and beggar alike this little life of feverish joys and sorrows is soothed by natural influences, cheered by sunlight and green shadows, softened by the perennial charm of hill and dale and rippling stream, and when the spring returns no more is rounded with a sleep. In the more intimate circle of human relationships he seems clearly to have realized that the sovereign elixir against the ills of life, the one antidote of its struggles and difficulties, its emptiness and unrest, is vigilant charity, faithful love in all its forms, love of home, love of kindred, love of friends, love of everything simple, just, and true. The larger and more sacred group of those serene and abiding influences flowing from well-centred affections was naturally identified with family ties, and it is clear that the unity and continuity of family life possessed Shakespeare's imagination with the strength of a dominant passion and largely determined the scope and direction of his practical activities. As we have seen, he displayed from the first the utmost prudence and foresight in securing a comfortable home for his family, and providing for the future welfare of his children. The desire of his heart evidently was to take a good position and found a family in his native place. And if this was a weakness he shares it with other eminent names in the republic of letters. In Shakespeare's case the desire may have been inherited, not only from his father, who had pride, energy, and ambition, but especially from his gently descended mother, Mary Arden of the Asbies. But, whatever its source, the evidence in favor of this cherished desire is unusually full, clear, and decisive. While the poet had no doubt previously assisted his father to retrieve his position in the world, the first important step in building up the family name was the grant of arms or armorial bearings to John Shakespeare in the year 1596. The father, it may be assumed, had applied to the heralds' college for the grant at the instance and by the help of his son. In this document, the draft of which is still preserved, the grounds on which the arms are given are stated as two: (1) because John Shakespeare's ancestors had rendered valuable services to Henry VII.; and (2) that he had married Mary, daughter and one of the heirs of Robert Arden of Wilmcote, in the said county, gentleman. In the legal conveyances of property to Shakespeare himself after the grant of arms he is uniformly described as "William Shakespeare of Stratford-upon-Avon, gentleman." He is so described in the midst of his London career, and this sufficiently indicates that Stratford was even then regarded as his permanent residence or home. In the following year another important step was taken towards establishing the position of the family. This was an application by John and Mary Shakespeare to the Court of Chancery for the recovery of the estate of the Asbies, which, under the pressure of family difficulties, had been mortgaged in 1578 to Edward Lambert. The issue of the suit is not known, but, as we have seen, the pleadings on either side occupy a considerable space and show how resolutely John Shakespeare was bent on recovering his wife's family estate.

Turning to the poet himself, we have the significant fact that during the next ten years he continued, with steady persistency, to build up the family fortunes by investing all his savings in real property,—in houses and land at Stratford. While many of his associates and partners in the Blackfriars company remained on in London living and dying there, Shakespeare seems to have early realized his theatrical property for the sake of increasing the acreage of his arable and pasture

land in the neighborhood of Stratford. In 1598, the year after the purchase of New Place, his family are not only settled there, but he is publicly ranked among the most prosperous and well-to-do citizens of Stratford. In that year there being some anticipation of a scarcity of corn, an official statement was drawn up as to the amount of wheat in the town. From the list contained in this document of the chief householders in Chapel Ward, where New Place was situated, we find that out of twenty holders of corn enumerated only two have more in stock than William Shakespeare. Other facts belonging to the same year, such as the successful appeal of a fellow-townsman for important pecuniary help, and the suggestion from an alderman of the borough that, for the sake of securing certain private and public benefits, he should be encouraged to complete a contemplated purchase of land at Shottery, show that Shakespeare was now recognized as a local proprietor of wealth and influence, and that he had so far realized his early desire of taking a good position in the town and neighborhood. It will be noted, too, that all the leading provisions of Shakespeare's will embody the same cherished family purpose. Instead of dividing his property between his two daughters, he left, as we have seen, the whole of his estate, the whole of his real property indeed, to his eldest daughter Mrs. Susanna Hall, with a strict entail to the heirs of her body. This indicates in the strongest manner the fixed desire of his heart to take a permanent position in the locality, and, if possible, strike the family roots deeply into their native soil. That this purpose was realized in his own case seems clear from the special respect paid to his memory. He was buried, as we have seen, in the chancel of the parish church, where as a rule only persons of family and position could be interred. His monument, one of the most considerable in the church, holds a place of honor on the north wall of the chancel, just above the altar railing. While this tribute of marked official respect may be due in part, as the epitaph intimates, to his eminence as a poet, it was no doubt, in a country district like Stratford, due still more to his local importance as a landed proprietor of wealth and position. Indeed, as a holder of the great tithes he was by custom and courtesy entitled to burial in the chancel.

If there is truth in the early tradition that Shakespeare originally left Stratford in consequence of the sharp prosecution of Sir Thomas Lucy, who resented with narrow bitterness and pride the presumption and audacity of the high-spirited youth found trespassing on his grounds, the victim of his petty wrath was in the end amply avenged. After a career of unexampled success in London, Shakespeare returned to his native town crowned with wealth and honors, and, having spent the last years of his life in cordial intercourse with his old friends and fellow townsmen, was followed to the grave with the affectionate respect and regret of the whole Stratford community. This feeling was indeed, we may justly assume, fully shared by all who had ever known the great poet. His contemporaries and associates unanimously bear witness to Shakespeare's frank, honorable, loving nature. Perhaps the most striking expression of this common feeling comes from one who in character, disposition and culture was so different from Shakespeare as his friend and fellow-dramatist Ben Jonson. Even his rough and cynical temper could not resist the charm of Shakespeare's genial character and gracious ways. "I loved the man," he says, "and do honor his memory on this side idolatry as much as any. He was indeed honest, and of an open and free nature, had an excellent phantasy, brave notions, and gentle expressions." As the genius of Shakespeare united the most opposite gifts, so amongst his friends are found the widest diversity of character, endowment, and disposition. This is only another way of indicating the breadth of his sympathies, the variety of his interests, the largeness and exuberant vitality of his whole nature. He touched life at so many points, and responded so instinctively to every movement in the complex web of its throbbing activities, that nothing affecting humanity was alien either to his heart or brain. To one so gifted with the power of looking below the surface of custom and convention, and perceiving not only the deeper elements of rapture and anguish to which ordinary eyes are blind, but the picturesque, humorous, or pathetic varieties of the common lot, every form of human experience, every type of character, would have an attraction of its own. In the view of such a mind nothing would be common or unclean. To Shakespeare all aspects of life, even the humblest, had points of contact with his own. He could talk simply and naturally without a touch of patronage or condescension to a hodman on his ladder, a costermonger at his stall, the tailor on his board, the cobbler in his combe, the hen-wife in her poultry-yard, the plowman in his furrow, or the base mechanicals at the wayside country inn. He could watch with full and humorous appreciation the various forms of brief authority and petty officialism, the bovine stolidity and empty consequence of the local Dogberries and Shallows, the strange oaths and martial swagger of a Pistol, a Bardolph, or a Parolles, the pedantic talk of a Holofernes, the pragmatical saws of a Polonius, or the solemn absurdities of a self-conceited Malvolio. On the other hand he could seize from the inner side by links of vital affinity every form of higher character, passionate, reflective, or executive,—lover and prince, duke and captain, legislator and judge, counsellor and king,—and portray with almost equal ease and with vivid truthfulness men and women of distant ages, of different races, and widely sundered nationalities.

As in his dramatic world he embraces the widest variety of human experience, so in his personal character he may be said to have combined in harmonious union the widest range of qualities, including some apparently the most opposed. He was a vigilant and acute man of business, of great executive ability, with a power of looking into affairs which included a thorough mastery of tedious legal details. But with all his worldly prudence and foresight he was at the same time the most generous and affectionate of men, honored and loved by all who knew him, with the irresistible charm that belongs to simplicity and directness of character combined with thoughtful sympathy and real kindness of heart. And while displaying unrivalled skill, sagacity, and firmness in business transactions and practical affairs, he could promptly throw the whole burden aside, and in the exercise of his noble art pierce with an eagle's wing the very highest heaven of invention. That indeed was his native air, his true home, his permanent sphere, where he still rules with undisputed sway. He occupies a throne apart in the ideal and immortal kingdom of supreme creative art, poetical genius, and dramatic truth. (T. S. B.)

BIBLIOGRAPHY.[1]

I. Principal Collective Editions.

Date	Plays or Works.	Editors, Publishers, etc.
1623	P.	1st folio. J. Heminge and H. Condell (Jaggard & Blount) [reprinted by J. Wright (1807, folio) and by L. Booth (1862–4, 3 vols. 4to), photo-lithographic facsimile by H. Stannton (1866, folio), reduced by J. O. Halliwell Phillipps, 1876, 8vo].
1632	P.	2d folio (Cotes).
1663, 64	P.	3d folio (Chetwinde).
1685	P.	4th folio.
1709	W.	1st 8vo, Rowe (Tonson), 7 vols., plates.

[1] This is an attempt to supply the want of a select classified bibliography of the literature connected with Shakespeare. Great compression has been necessary. Articles in periodicals not issued separately, and modern critical editions of single plays, are not included; and only those of the plays usually contained in the collective editions are noticed. The name, in its various spellings (Shakespeare, Shakspeare, Shakespear, Shakspere, etc.), is usually represented by the initial *S*.

Heine. *Englische Fragmente und S.'s Mädchen und Frauen*, Hamburg, 1861, sm. 8vo; F. A. Leo, *S.'s Frauenideale*, Halle, 1868, 8vo; F. M. v. Bodenstedt, *S.'s Frauencharaktere*, 2d ed., Berlin, 1876, 8vo; M. Summer, *Le Héroines de Kalidasa et les Héroines de S.*, 1879, sm. 8vo; Lady Martin, *On some of S.'s Female Characters*, 1885, 8vo; Mrs. M. L. Elliott, *S.'s Garden of Girls*, 1885, 8vo. HUMOR: J. Weiss, *Wit, Humour, and S.*, Boston, 1876, 16mo; J. R. Ehrlich, *Der Humor S.'s*, Vienna, 1878, 8vo.

V. LANGUAGE, INCLUDING GRAMMARS AND GLOSSARIES.

T. Edwards, *Supplement to Mr. Warburton's Edition, being the Canons of Criticism and Glossary*, 1748, 8vo, 7th ed. 1765; R. Warner, *Letter on a Glossary to S.*, 1768, 8vo; R. Nares, *Glossary*, 1822, 4to, new edition. 1859, 2 vols. 8vo; J. M. Jost, *Erkl. Worterbuch*, Berlin, 1830, sm. 8vo; J. O. Halliwell Phillipps, *Dictionary of Archaic and Provincial Words*, 1846–7, 2 vols. 8vo, and *Hand-Book Index to the Works*, 1866, 8vo, phrases, manners, etc.; J. L. Hilgers. *Sind nicht in S. noche manche Verse wiederherzustellen in Prosa?* Aix-la-Chapelle, 1852, 4to; N. Delius, *S. Lexikon*, Bonn, 1852, 8vo; W. S. Walker, *S.'s Versification*, 1854, 8vo, and *Examination of the Text of S., with Remarks on his Language*, 1860, 3 vols. 8vo; C. Bathurst, *S.'s Versification at different Periods*, 1857, sm. 8vo; S. Jervis, *Dictionary of the Language of S.*, 1868, 4to; G. Helmes, *The English Adjective in S.*, Bremen, 1868, 8vo; A. J. Ellis, *On Early English Pronunciation*, 1869–75, 4 vols. 8vo; W. L. Rushton, *S.'s Euphuism*, 1871, 8vo; D. Rohde, *Die Hülfszeitwort "To do" bei S.*, Göttingen, 1872, 8vo; E. A. Abbott, *Shakespearian Grammar*, new edition, 1873, sm. 8vo; K. Seitz, *Die Alliteration im Engl. ver. u. bei S.*, 1875, 4to; F. Pfeffer, *die Anredepronomina bei S.*, 1877, 8vo; P. A. Bronisch, *Das neutrale Possessivpronom bei S.*, 1878, 8vo; O. W. F. Lohmann, *Die Auslassung des Relativpronomens, etc.*, 1879, 8vo; A. Dyce, *Glossary*, new edition, 1880, 8vo; C. Deutchbein, *S. Grammatik f. Deutsche*, 1882, 8vo; A. Lummert, *Die Orthographie der ersten Folioausgabe*, 1883, 8vo; C. Mackay, *Obscure Words and Phrases in S.*, 1884, 8vo; G. H. Browne, *S.'s Versification*, Boston, 1884, 12mo, includes bibliography; L. Kellner, *Zur Syntax des Engl. Verbums*, Vienna, 1885, 8vo; J. H. Siddons, *Shakespearian Referee*, Washington, 1886, 8vo, encyclopædic glossary.

VI. QUOTATIONS.

C. Gildon, *Shakespeariana*, in his *Complete Art of Poetry*, 1718, 12mo, the first of the class: Dr. W. Dodd, *The Beauties of S.*, 1752, 2 vols. 12mo., reprinted (in various forms, more frequently than any similar work; C. Lofft, *Aphorisms from S.*, 1812, 12mo; T. Dolby, *The Shakespearian Dictionary*, 1832, 8vo, and *A Thousand Shakespearian Mottoes*, 1856, 32mo; Mrs. M. C. Clarke, *S. Proverbs*, 1847, sm. 8vo, reprinted; J. B. Marsh, *Familiar, Proverbial, and Select Sayings from S.*, 1864, 8vo; E. Routledge, *Quotations from S.*, 1867, 8vo; C. W. Stearns, *The S. Treasury*, N. Y., 1869, 12mo; Capt. A. F. P. Harcourt, *The S. Argosy*, 1874, sm. 8vo; G. S. Bellamy, *New Shakespearian Dictionary*, 1877, 8vo; A. A. Morgan, *The Mind of S.*, 1880, 8vo, quotations in alphabetical order; C. Arnold, *Index to Shakespearian Thought*, 1880, 8vo.

VII. CONCORDANCES.

A. Becket, *Concordance*, 1787, 8vo, the earliest; S. Ayscough, *Index*, 1790, large 8vo, 2d ed. enlarged, 1827, useful; F. Twiss, *Complete Verbal Index*, 1805, 2 vols. 8vo; M. Cowden Clarke, *Complete Concordance*, 1844, 8vo, deals only with the plays (no complete one exists); Mrs. H. H. Furness, *Concordance to Poems*, Philadelphia, 1874, 8vo, completing Mrs C. Clarke's; A. Schmidt, *S. Lexikon*, Berlin, 1874–5, 2 vols. large 8vo, in English, both concordance and

dictionary: C. and M. C. Clarke, *The S. Key*, 1879, 8vo, companion to the *Concordance;* J. Bartlett. *The S. Phrase Book*, 1881, 8vo; W. H. D. Adams, *Concordance to Plays*, 1886, 8vo.

VIII. Probable Sources.

Mrs. C. Lennox, *S. Illustrated*, 1753–4, 3 vols. 12mo, dedication by Johnson, many of the observations also said to be by him; T. Hawkins, *The Origin of the English Drama*, 1773, 3 vols. 8vo; J. Nichols, *The Six Old Plays on which S. founded Measure for Measure, etc.*, 1779, 2 vols. 12mo; T. Echtermeyer, L. Henschel, and K. Simrock, *Quellen des S.*, Berlin, 1831, 3 vols. 16mo; L. Tieck, *S.'s Vorschule*, Leipsic, 1823–9, 2 vols. 8vo; J. P. Collier, *S.'s Library* [1843], 2 vols. 8vo, 2d ed. [by W. C. Hazlitt] 1875, 6 vols. 8vo; W. C. Hazlitt, *S.'s Jest Books*, 1864, 3 vols. 8vo; W. W. Skeat, *S.'s Plutarch*, 1875, 8vo; F. A. Leo, *Four Chapters of North's Plutarch*, 1878, folio; R. Simpson, *The School of S.*, 1878, 2 vols. 8vo.

IX. Special Knowledge.

Angling: H. N. Ellacombe, *S. as an Angler*, 1883, 8vo. Bible: T. R. Eaton, *S. and the Bible*, 1858, 8vo; J. Brown, *Bible Truths with Shakespearian Parallels*, 3d ed. 1872, 8vo; J. Rees, *S. and the Bible*, Phil., 1876, sm. 8vo; Bp. C. Wordsworth, *S.'s Knowledge and Use of the Bible*, 1864, 8vo; C. Bullock, *S.'s Debt to the Bible*, 1879, 8vo. Botany: J. E. Giraud, *Flowers of S.*, 1847, 4to, plates; S. Beisly, *S.'s Garden*, 1864, 8vo; H. N. Ellacombe, *Plant-lore and Garden-craft of S.*, 2d ed. 1884, sm. 8vo; L. H. Grindon, *S.'s Flora*, 1883, 8vo. Emblems: H. Green, *S. and the Emblem Writers*, 1870, 4to. Folk-lore: W. Bell, *S.'s Puck and his Folk-lore*, 1852-64, 3 vols. sm. 8vo; W. J. Thoms, "The Folk-lore of Shakespeare," in *Three Notelets*, 1865, 8vo, reprinted from *Athenæum*, 1847; B. Tschischwitz, *Nachklänge Germanischer Mythe in S.*, Halle, 1868 8vo [W. C. Hazlitt, editor], *Fairy Tales, Legends and Romances, illustrating S., etc.*, 1875, 8vo; T. F. T. Dyer, *Folk-lore of S.*, 1884, 8vo. Learning: P. Whalley, *Enquiry into the Learning of S.*, 1748, 8vo; R. Farmer, *Essay on the Learning of S.*, 1767, 8vo., reprinted in the variorum (1821) and other editions, criticised by W. Maginn, see *S. Papers annotated by S. Mackenzie*, N. Y., 1856, sm. 8vo; [K. Prescot], *Essay on the Learning of S.*, 1774, 4to; E. Capell, *The School of S.*, 1780, 4to (vol. iii. of his *Notes and Various Readings to S.*, 1779–83, 3 vols. 4to); P. Stapfer, *S., et l'antiquité*, Paris, 1879, 8vo, translated, 1880, 8vo. Legal: W. L. Rushton, *S. a Lawyer*, 1858, 8vo, *S.'s Legal Maxims*, 1859, 8vo, *S.'s Testamentary Language*, 1869, 8vo, and *S. illustrated by the Lex Scripta*, 1870, 8vo; Lord Campbell, *S.'s Legal Acquirements*, 1859, 8vo; H. T., *Was S. a Lawyer?* 1871, 8vo; J. Kohler, *S. vor dem Forum der Jurisprudenz, und Nachwort*, 1883-4, 2 pts. 8vo; F. F. Heard, *S. as a Lawyer*, Boston, 1884, 16mo; C. K. Davis, *The Law in S.*, St. Paul, U. S., 1884, 8vo. Medicine: G. Farren, *Essays on Mania exhibited in Hamlet, Ophelia, etc.*, 1833, 8vo; J. C. Bucknill, *The Medical Knowledge of S.*, 1860, 8vo, and *The Mad Folk of S.*, 1867, sm. 8vo; C. W. Stearns, *S.'s Medical Knowledge*, N. Y., 1865, sm. 8vo; G. Cless, *Medicinische Blumenlese aus S.*, Stuttgart, 1865, 8vo; A. O. Kellogg, *S.'s Delineations of Insanity, etc.*, N. Y., 1866, 16mo; H. R. Aubert, *S. als Mediciner*, Rostock, 1873, 8vo; J. P. Chesney, *S. as a Physician*, St. Louis, 1884, 8vo; B. R. Field, *Medical Thoughts of S.*, 2d ed., Easton, U. S., 1885, 8vo. Military: W. J. Thoms, "Was S. ever a Soldier?" in his *Three Notelets*, 1865, 8vo. Natural History: R. Patterson, *Insects mentioned in S.'s Plays*, 1838, 8vo; J. H. Fennell, *S. Cyclopædia*, 1862, 8vo, pt. i. Zoology, Man (all published); J. E. Harting, *Ornithology of S.*, 1871, 8vo; C. R. Smith, *The Rural Life of S.*, 1874, 8vo; J. Walter, *S.'s Home and Rural Life*, 1874, 4to, illustrated; B. Mayou, *Natural History of S.*, 1877, 8vo, quotations; E. Phipson, *Animal Lore of S.'s Time*, 1883, sm. 8vo. Philosophy: W. J. Birch, *Philosophy and Religion of S.*, 1848, sm. 8vo; V. Knauer, *W. S., der Philosoph*, Innsbruck, 1879, 8vo. Printing: W. Blades, *S. and Typography*, 1872, 8vo. Psychology: J. C. Bucknill, *The Psychology of S.*, 1859, 8vo; E. Onimus, *La Psychologie dans les Drames de S.*, 1876, 8vo. Sea: J. Schuemann, *See u. Seefahrt in S.'s Dramen*, 1876, 4to.

X. Periodicals.

S. Museum, edited by M. L. Moltke, Leipsic, 23d April, 1870, to 23d February, 1874, 20 Nos. (all published); *Shakespeariana*, 1883, sm. 8vo, in progress. From the commencement of *Notes and Queries* in 1856, a special Shakespeare department (see Indexes) has been carried on. See also W. F. Poole's *Index to Periodical Literature*, Boston, 1882, and supplements.

XI. Shakespeare Societies and their Publications.

Proceedings of the Sheffield S. Club (1819–29), 1829, 8vo; Shakespeare Society, various publications, 1841–53, 48 vols. 8vo; New Shakspere Society, *Transactions* and other publications, reprints of quartos, etc., 1874, etc., 8vo, in progress; Deutsche S. Gesellschaft, *Jahrbuch*, Weimar, 1865, etc., in progress. The S. Societies of New York and Philadelphia publish transactions.

T.)

SHALLOT. See Horticulture, vol. xii. p. 300.

SHAMANISM is the name commonly given to the type of religion which once prevailed among all the Ural-Altaic peoples,—Tungus, Mongol, and Turkish,—and which still lives in various parts of northern Asia[1] in spite of the progress of Mohammedanism, Buddhism, and Christianity. The shaman himself (in Turkish, *kam*) is a wizard-priest, closely akin to the medicine-men of savage tribes in other parts of the world. Outsiders often describe Shamanism as pure devil-worship, but in reality the shaman or *kam* deals with good as well as with evil spirits, especially with the good spirits of ancestors (*cf.* Religion, vol. xx. p. 376). Among the Altaians, for example, the practices of the sorcerers rest on an elaborate cosmogony and a developed doctrine of good and evil powers, the friends and enemies of man. The *kam* has the power of influencing these by magic ritual, and his gift is hereditary,—his own ancestors, now good spirits, being the great assistants of his work. His two chief functions are to perform sacrifice, with which is conjoined the procuring of oracles, and to purify houses after a death, preventing the dead man from continuing his injurious presence among the living; see the full accounts of Radloff, *Aus Siberien*, 1884, vol. ii. In his magical apparatus a drum (*tüngür*) holds the chief

[1] [A form of Shamanism exists amongst the tribes of the north-west coast of North America.—Am. Ed.]

place. The ceremonies have a dramatic character, the wizard acting an ascent to the heavens or a descent to the under-world, and holding colloquy with their denizens in scenes of great excitement ending in ecstasy and physical collapse. The epithet of devil-worship as applied to the Altaian Shamanism is so far justified that the great enemy of man, Erlik, the king of the lower world, from whom death and all evils come, is much courted, addressed as father and guide, and propitiated with offerings. He is not, however, a power coördinate with the highest good god Kaira Kan, but is the creature of the latter, who banished him underground for his evil deeds.

SHAMMAI, a Jewish rabbi, sometimes called שַׁמַּאי, "the elder," was the contemporary of HILLEL (*q.v.*) and the head of a rival school. The pair are twelfth in order in the *Pirke Aboth*, where we are informed that Shammai enjoined his disciples to make a special business of the study of the law, to promise little and perform much, and to receive every one in a friendly spirit. Of his personal history nothing is known. The tendency of Shammai and his school is represented as having been towards a more scrupulously and burdensomely literal construction of the law than was thought necessary by Hillel; but their differences so far as known turned upon very trifling minutiæ. One example of his rigor will suffice. It is related of him in the *Mishnah* that a grandson having been born to him during the feast of tabernacles he caused the ceiling to be removed and the bed to be canopied with branches, in order that the child also might observe the solemnity according to the law.

SHAMOKIN, a post borough of the United States, in Northumberland county, Pennsylvania, 20 miles southeast of Sunbury, is a great centre of the coal-trade, and had a population in 1881 of 8184.

SHANGHAI, a city of China. The native city of Shanghai is situated in 31° 15′ N. lat. and 121° 27′ E. long., and stands on the left or western bank of the Hwang-p'u[1] river, about twelve miles from the point where that river empties itself into the estuary of the Yang-tsze-kiang. The walls which surround it are about 3½ miles in circumference, and are pierced by seven gates. The streets and thoroughfares may be said to illustrate all the worse features of Chinese cities—dirt, closeness, and absence of all sanitary arrangements; while the want of any building of architectural or antiquarian interest robs the city of any redeeming traits. On the eastern face of the city, between the walls and the river, stands the principal suburb, off which the native shipping lies anchored. The native town has thus nothing to recommend it except its geographical position. Situated in the extreme eastern portion of the province of Kiang-soo, and possessing a good and commodious anchorage, as well as an easy access to the ocean, it forms the principal port of central China. From the western wall of the city there stretches away a rich alluvial plain extending over 45,000 square miles, which is intersected by numerous waterways and great chains of lakes. The products of this fertile district, as well as the teas and silks of more distant regions, find their natural outlet at Shanghai. The looms of Soochow and the tea plantations of Gan-hwuy, together with the rice of this "garden of China," have for many years before treaty days supplied the Shanghai junks with their richest freight. But though thus favorably situated as an emporium of trade Shanghai did not attract the attention of foreign diplomatists until the outbreak of the war of 1841, when the inhabitants purchased protection from the bombarding propensities of Admiral Parker by the payment of a ransom of one million taels. In the Nanking treaty, which was signed in the following year, Shanghai was included among the four new ports which were thrown open to trade by the terms of that document. In 1843 Sir George Balfour, then Captain Balfour, was appointed British consul, and it was on his motion that the site of the present English settlement, which is bounded on the north by the Soochow creek, on the south by the Yang-king canal, and on the east by the river, was chosen. The site, thus defined on its three sides (on the west no boundary was marked out) is three-fifths of a mile in length, and was separated from the native city by a narrow strip of land which was subsequently selected as the site of the French settlement. Later again the Americans established themselves on the other side of the Soochow creek, on a piece of land fronting on the river, which there makes a sharp turn in an easterly direction. At first merchants appeared disinclined to take advantage of the opportunities offered them at Shanghai. "At the end of the first year of its history as an open port Shanghai could count only 23 foreign residents and families, 1 consular flag, 11 merchants' houses, and 2 Protestant missionaries. Only forty-four foreign vessels had arrived during the same period."[2] By degrees, however, the manifold advantages as a port of trade possessed by Shanghai attracted merchants of all nationalities; and from the banks of the Hwang-p'u

Shanghai.

arose lines of hongs and handsome dwelling-houses, which have converted a reed-covered swamp into one of the finest cities in the East.

The number of foreigners, other than English, who took up their abode in the English settlement at Shanghai made it soon necessary to adopt some more catholic form of government than that supplied by an English consul who had control only over British subjects, and by common agreement a committee of residents, consisting of a chairman and six members, was elected by the renters of land for the purposes of general municipal administration. It was expected when the council was formed that the three settlements —the British, French, and Americans—would have been incorporated into one municipality, but international jealousy prevented the fulfilment of the scheme, and it was not until 1863 that the Americans threw in their lot with the British. In 1853 the prosperity of the settlements received a severe check in consequence of the capture of the native city by a band of insurgents, who held possession of the walls from September in that year to February, 1855. This incident, though in many ways disastrous, was the exciting cause of the establishment of the foreign customs service, which

[1] [Also called the Woosung river. See plan.—AM. ED.]

[2] *The Treaty Ports of China and Japan*, by W. F. Mayer.

has proved of such inestimable advantage to the Chinese Government. The confusion into which the customs system was thrown by the occupation of the city by the rebels induced the Chinese authorities to request the consuls of Great Britain, France, and the United States to nominate three officers to superintend the collection of the revenue. This arrangement was found to work so well that on the reoccupation of the city the native authorities proposed that it should be made permanent, and Mr. H. N. Lay, of H. M.'s consular service, was in consequence appointed inspector of the Shanghai customs. The results of Mr. Lay's administration proved so successful that when arranging the terms of the treaty of 1858 the Chinese willingly assented to the application of the same system to all the treaty ports, and Mr. Lay was thereupon appointed inspector-general of maritime customs. On the retirement of Mr. Lay in 1862 Sir Robert Hart was appointed to the post, which he still (1886) occupies.

During the period from 1856 to 1864 the trade of Shanghai increased by leaps and by bounds, and its prosperity culminated between 1860 and 1864, when, in addition to the ordinary commerce, the influx of Chinese into the foreign settlement in consequence of the advance eastward of the T'ai-p'ing rebels added enormously to the value of land and to the profits of the leaseholders. Both in 1860 and again in 1861 the rebels advanced to the walls of Shanghai, and on both occasions were driven back in confusion by the British troops and volunteers, aided by the naval forces of England and France. It was in connection with this resistance to the rebels at Shanghai that General Gordon assumed the command of the Chinese force, which under his direction gave a meaning and reality to the hitherto somewhat boastful title of "ever-victorious army" it had assumed under the generalship of the two American adventurers Ward and Burgevine. To Shanghai the successful operations of Gordon against the rebels brought temporarily disastrous consequences. With the disappearance of the T'ai-p'ings the refugees who had sought safety in the foreign settlements returned to their homes, leaving whole streets and quarters deserted and empty. The loss thus inflicted on the municipality was very considerable, and was intensified by a commercial crisis in the markets of cotton and tea, in both of which articles there had been a great deal of over-speculation. But, though the abnormal prosperity produced by extraordinary circumstances was thus suddenly brought to an end, the genuine trade of the port has steadily advanced, subject of course to occasional fluctuations. For example, between the years 1878 and 1881 the gross value of the trade increased from 110,956,274 taels [$151,229,220.86] to 141,291,357 taels [$196,394,986.23]. In 1883, however, this amount fell to 110,433,531 taels [$153,502,608.09], while in 1884 it rose again to 113,215,520 taels [$157,369,572.80], although at this time, as will be remembered, hostilities were being carried on between France and China. In the same year 53,562 bales of silk were exported, as against 47,807 bales in 1883, and 27,084,675 lb of green tea, as against 25,336,041 lb in 1883. In black tea there was a falling off, the respective figures being 43,813,058 and 48,251,637 lb. The total burden of foreign steamers which entered and cleared at Shanghai during 1884 was 3,145,242 tons. Of this amount 2,238,433 tons were British, 500,222 were American, 188,484 were Japanese, 93,226 were German, 88,983 were French, 24,572 were Russian, and 11,322 were Danish.

According to the latest estimate the native population of the city and suburbs of Shanghai amounts to 156,000. When to this number the boat population, amounting to 11,000, and the mixed inhabitants of the foreign settlements, numbering 145,500, are added, a total is reached of 312,500 souls.

The vastness of English interests in China and the large British population at Shanghai gave rise in 1865 to the establishment of a British supreme court for China and Japan, —Sir Edmund Hornby, who was then the judge of the British court at Constantinople, being the first judge appointed to the new office. The court thus constituted not only exercises jurisdiction over the British subjects at Shanghai but acts as a court of appeal from all British consular courts in China and Japan. All charges against Chinamen within the settlement are tried before a mixed court, which sits daily, presided over by a Chinese official and an officer of the consular service. During the year 1884 2304 criminal cases were tried before this tribunal, and 99 civil cases,—in 85 of which cases no less a sum than £60,000 [$291,600] was involved.

A handsome bund runs along the river frontage of the three foreign settlements, and the public buildings, especially in the British settlement, are large and fine. The cathedral, which is built in the Gothic style, is a notable example of Sir Gilbert Scott's skill as an architect, and the municipal offices, club-house, and hospitals are all admirable in their way. Shanghai is now connected with Peking by a telegraph, which will doubtless before long be supplemented by a railway. Some years ago a short railway was laid down between Shanghai and Woosung by some foreigners who wished to force the pace at which China was progressing. But the time had not come when such a step would be adopted by the Chinese, and after a few weeks' existence the plant was bought by the native authorities and shipped to Formosa, where it has since been allowed to rust and rot. The climate of Shanghai is essentially unhealthy. It lies low, and, though the early winter is enjoyable, snow and ice being occasionally seen, the summer months are sweltering hot. Fever, dysentery, and cholera are unfortunately common complaints, and it is only by frequent trips to Japan and Chefoo that the residents are able to preserve health and strength. But, notwithstanding every disadvantage, the position occupied by Shanghai as a centre of trade, situated as it is at the mouth of the Yang-tsze-kiang, in the immediate neighborhood of the richest silk and tea districts, and in proximity to Japan and the newly-opened ports of Corea, insures for it an increasing volume of commerce and a widening prosperity in the future. (R. K. D.)

SHANNON. See IRELAND, vol. xiii. p. 222.

SHANS. This name is applied to a number of for the most part semi-independent communities occupying a region bounded on the W. by Burmah and Assam, N. and N.E. by the Chinese province of Yun-nan, E. by Tongking, and S. by Siam (see Plate IX.). Ethnologically the race has a much wider extension, including the Siamese (see SIAM), and also, according to Garnier and Colquhoun, the hill tribes around the Tong-king delta and various tribes of Kwang-tung and Kwang-se, and extending across the north of Burmah into Assam. It is also widely diffused through southwestern Yun-nan. Terrien de Lacouperie considers it allied to the Mon, the Mung, and the Pa, and places its early home in the mountains north of Sze-chuen, whence, not having amalgamated with the growing Chinese empire, it was gradually forced southwards. Although the level of civilization and the purity of their Buddhism vary considerably among the different branches of the race, there is everywhere a remarkable resemblance in appearance, manners, customs, and polity. The traditions current of their origin, too, though localized by each in its own habitat, are closely similar. This great homogeneity seems the more remarkable in that the race is found not only living under many different political systems,—*i.e.*, either independent, or subject to Burmah, China, or Siam,—but often in communities isolated by mountain ranges, inhabited by tribes of different race and character. All this seems to point to a political unity in earlier times.

The Shans probably appeared on the upper Irawadi nearly two thousand years ago, but Burmese and Shan traditions agree that they were established some centuries earlier on the upper waters of the Shweli and on the Salwín and adjacent valleys on the southwest frontiers of Yun-nan. Here at all events, in the 7th and 8th centuries, we hear of the growth of that power which, temporarily broken by Burmah in the 11th century, reached its highest development in the 13th. This Shan empire, known by the classical Indian name of Kausambi,—corrupted after the punning Chinese fashion into Koshan-pyi, *i.e.*, nine Shan states,—was a confederacy of about ten states, known among themselves by the name of the most powerful member, Mau, or Muang Mau. A great leader, Sam Lung Pha, brother of the king of Mau, overran and conquered Upper Assam from the Satiyas in 1229, the dynasty lasting until the British annexation. These Ahoms still inhabit the Assam districts of Sibsagar and south and east Lakhimpur, though pressed on from the southwest by the Bengalis, whom they despise as a black and inferior race, preferring to associate with the

Chinese, whom they regard as congeners, and as the greatest race in the world.

This 13th and the following century also saw Tali to the east and Arakan to the west invaded, Burmah being then weakened by the Mongol invasion; Chieng Mai and other southern Shan states were also annexed, and "Ayuthia" (*i.e.*, Siam), Cambodia, and Tavoy are claimed by the Shan historians as among their conquests, the Shan influence being felt even in Java. From the 14th to the 16th century wars with both Burmah and China were frequent, and Shan dynasties ruled at times in Burmah; but in 1556–62 the Burmese conquered Mogaung, the chief province of Mau, when Buddhism is recorded to have been introduced: probably only a reform of religion is meant. In 1604 the districts now known as the Chinese Shan States, *i.e.*, the heart of the Mau empire, lying chiefly in the Ta-peng basin, east of Bamo,—a town whose population also is mainly Shan,—were finally conquered by China, Mogaung remaining independent on sufferance till absorbed by Burmah in 1796.

Zimmé or Chieng Mai (including Kiang Hai, Kiang Sen, Lagong and Lapong), whose capital is now an important and well-built town, and Vien Chang on the east of the Me-kong, were both great Shan centres, warring, with various fortunes, with Burmah and Cambodia, and with each other, till subjected by the growing power of Siam late in the last century.

The Burmese Shan States, especially those more remote from Mandalay, have latterly become practically independent; and, the tyranny which led to extensive southward migration having thus ceased, the stream is partly returning northwards. Descendants, too, of the population deported by Siam from Kiang Sen about a hundred years ago are now by the king's permission returning to people that fertile territory. The Burmese plan with the Shans was to govern by fostering internal dissensions, and they are bitterly hated, while the Chinese are in an equal degree liked and respected. The great Shan state of Kiang Hung has now accepted the dictation of China, to whom in fact, like some of its lesser neighbors, it has always paid certain taxes, while acknowledging the supremacy of Burmah. Kiang Tung to the south, which has been Burmese for over a century, has lately made overtures to Siam, though not forgetting the injuries inflicted by that power in 1854. The numerous ruins of great cities over the whole region from Chieng Mai to Kiang Tung testify to former wealth and prosperity, though they may not have all existed contemporaneously. In Luang Prabang in the northeast, on the other hand, tribes of a partly Chinese race are pressing southwards. It is remarkable how many of the conquering irruptions of southeast Asia were due mainly to the eviction of such conquerors by some stronger power. Incessant wars and vast deportations have tended to assimilate the various populations of all this region.

Each Shan state is governed by a *tsobwa* (*chao p'hya*) or supreme chief, aided by a council, and often by a coadjutor. Where the Shans are in immediate contact with one of their great neighbors their habits and customs are necessarily modified; otherwise, speaking generally, civilization increases southwards. Religion is nominally Buddhist, and the priests, though their lives are usually far from correct, have great influence; temples, caves, and other localities sacred to Buddha, are thronged with worshippers liberal with their offerings; but the practical exercise of religion consists chiefly in efforts to propitiate or avert the evil influence of the *nats* or *p'hees*, demons and spirits everywhere present, to whom all accidents and illnesses are attributed. Along with the Buddha, various images, among which the horse is not uncommon, are adored (though there are temples in which these are not found); and fetishes—natural objects of special form, *e.g.*, of some part of the body—are kept in the house to avert disease. Medical treatment consists largely in magical practices, and individuals denounced by the sick as the cause of their illness frequently have their houses burned and are themselves deported to a distance. Thus, too, ordeals have a prominent place in legal practice. The Shans have no Buddhist prejudices against killing poultry or cattle for food, but like other Indo-Chinese and the Malays do not use milk. Slavery is general; the supply is recruited partly by raids on neighboring hill-tribes; the Indo-Chinese practice of slavery for debt also prevails. The slaves are not ill treated, and are chiefly employed in field labor by the chaos, who own great numbers. In appearance the North Shans are sallow, but hardly darker than South Europeans, and are characterized by a short broad flat face more elongated and nearer the Tartar type in the upper classes; they have red cheeks, brown eyes hardly oblique, black hair, nose almost aquiline, and are of medium height. The Chinese Shans are much smaller, with squat figures, prominent cheek-bones and oblique eyes.

The practice of tattooing prevails in some districts, down to the upper waters of the Me-nam, and it occurs also among the Laos in the southeast, the tattooed being known as the black-bellied, the non-tattooed as the white-bellied. The Shans are all hardier and more manlier than their congeners the Siamese, and they are also more sedate and more self-possessed than the Burmese. Most travellers speak of them as brave, friendly, social, and hospitable, but a good deal of the oppression and cruelty natural to a semi-barbarous condition prevails. They are cleanly and fond of bathing, the town and villages being supplied with bamboo aqueducts. Drunkenness, except at festivals, is rare. Gambling is common, whole families being sold into slavery to pay debts thus contracted. Public gaming and the sale of spirits and opium are monopolies. They show much artistic taste in the beautiful colors of their textile fabrics, the needlework and embroidery of the women, and the designing and execution of the silver ornaments which are worn in profusion. They show great aptitude for trade, and are said by Mr. Holt Hallett to welcome the prospect of the railway intended to connect their country with Maulmein, crossing thence to Raheng or some neighboring point on the Me-nam, and on through the fertile valleys and plateaus on its upper tributaries to the Chinese frontier.

Tea is found, both wild and cultivated, from Zimmé to Kiang Tung. Opium is exported to Mandalay and to China. Indian corn, sugar, and tobacco are grown in the low grounds, and excellent cotton and indigo (which also grows wild in the hills). Teak has long been worked by Anglo-Burmese in the eastern affluents of the Toong-yen and neighboring valleys, and has become comparatively scarce west of the Me-ping; but it grows freely in the hills and valleys around Kiang Sen and Lagong, and in the hill region of eastern Siam, where, however, it is of inferior quality. Silk is produced, and iron, copper, and silver-lead (galena) ores are worked.

The Shan languages are classified by Dr. Cushing as follows: Ahom (Assam), extinct; Khamti, on the upper Irawadi and other valleys on the extreme north of Burmah; the Chinese (Mau) Shans, east from Bamo; Shans proper, between the mountains which bound the Burmese plains in the east and the Me-kong, and between 23° and 19° N. lat.; Laos to the south of this, from 19° north to the frontiers of Siam; and lastly Siamese. The last two, as spoken, differ but little, and the three others may be grouped together. All have separate alphabets (related, however, in form), except the Siamese; and the spelling being phonetic, the orthography is tolerably fixed. But it is a tonal language, and the vowel signs are few, so that some have two or three values assigned them. There are a good many Pali words due to Buddhism, many Burmese words in the districts under Burmese influence, and a large foreign element in the Chinese Shan state of Ho-tha, where the race is perhaps not fundamentally Shan.

Phayre, *History of Burmah.* (C. T.)

SHARK. The systematic position of the group of Sharks or *Selachoidei* in the class of Fishes, their classification, and their general external and anatomical characteristics have been already sufficiently noticed under ICHTHYOLOGY (vol. xii. pp. 723–4 *sq.*), and we have here to supplement that article only by a fuller reference to the natural history of the more common and more important types of the group.

Sharks are almost exclusively inhabitants of the sea, but some species freely enter the mouths of large rivers and one species (*Carcharias gangeticus*) occurs frequently high up in the large rivers of India, and in the Tigris about Baghdad, at a distance of 350 miles from the Persian Gulf in a straight line, and has

even been reported from a lake in Viti Levu (Fiji Islands) which is shut off from the sea by a cataract.[1] Sharks are found in all seas; most numerous between the tropics, they become scarcer beyond, a few only reaching the Arctic circle; it is not known how far they advance southwards in the Antarctic region. Altogether some hundred and fifty different species have been described.

With regard to their habits many are littoral species, the majority pelagic, and a few are known to belong to the bathybial fauna, having hitherto been obtained down to a depth of 500 fathoms.

Littoral Sharks.—The littoral forms are of small size, and generally known under the name of "dogfishes," "hounds," etc. Some pelagic sharks of larger size also live near the shore on certain parts of a coast, but they are attracted to it by the abundance of food, and are as frequently found in the open sea, which is their birthplace; therefore we shall refer to them when we speak of the pelagic kinds.

The majority of the littoral species live on the bottom, sometimes close inshore, and feed on small marine animals or any animal substance. The following are deserving of special notice:

The Tope (*Galeus*) is common on the coasts not only of England, Ireland, and of the more southern parts of Europe, but also of South Africa, California, Tasmania, and New Zealand. Its teeth are equal in both jaws, of rather small size, flat, triangular, with the point directed towards the one side, and with a notch and denticulations on the shorter side (Fig. 1). It is of a uniform slaty-gray color, and attains to a length of 6 feet. The female brings forth some thirty living young at one birth in May. It cannot be regarded as a very destructive fish, but becomes troublesome at times to fishermen by taking their bait and driving away other fish they desire to catch.

FIG. 1.—Teeth of Tope. *u*, upper; *l*, lower. (×2).

The Hounds proper (*Mustelus*) possess a very different dentition, the teeth being small, obtuse, numerous, arranged in several rows like pavement (Fig. 2). Five or six species are known from the shores of the various temperate and subtropical seas, one (*M. vulgaris*), being common on the coasts of Great Britain and the United States on the Pacific as well as the Atlantic side. It is of a uniform gray color or sparingly spotted with white, and attains to a length of 3 or 4 feet. The young, about twelve in number, are brought forth alive in November. It is a comparatively harmless fish, which feeds on shells, crustaceans, and decomposing animal substances.

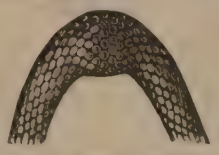

FIG. 2. Teeth of *Mustelus*.

Of the Dog-Fishes proper (*Scyllium*, *Chiloscyllium*, etc.), some twenty species are known, which are spread over nearly all the temperate and tropical seas. Their teeth are small, in several series, with a longer pointed cusp in the middle, and generally one or two smaller ones on each side (Figs. 3 and 5). They are all oviparous, their oblong egg-shells being produced at each corner into a long thread by which the egg is fastened to some fixed object. Some of the tropical species are ornamented with a pretty pattern of coloration. The two British species, the Lesser and the Larger Spotted Dog-Fish (*Sc. canicula* and *Sc. catulus*), belong to the most common fishes of the coast, and are often confounded with each other. But the former is finely dotted with brown above, the latter having the same parts covered with larger rounded brown spots, some of which are nearly as large as the eye. As regards size,

FIG. 3.—Teeth of *Scyllium canicula*.

the latter exceeds somewhat the other species, attaining to a length of 4 feet. Dogfishes may become extremely troublesome by the large numbers in which they con-

FIG. 4.—*Chiloscyllium trispeculare*.

gregate at fishing stations; nor do they compensate for the injury they cause to fishermen, being but rarely used as food, except at certain seasons by the poorer

FIG. 5.—Confluent Nasal and Buccal Cavities of the same fish.

classes of the Mediterranean countries, in China and Japan, and in the Orkneys, where they are dried for home consumption. The Black-mouthed Dog-Fish (*Pristiurus melanostomus*) is another European species which is rarely caught on the British coasts, and is recognized by a series of small, flat spines, with which each side of the upper edge of the caudal fin is armed.

The Tiger-Shark (*Stegostoma tigrinum*) is one of the commonest and handsomest sharks in the Indian Ocean. The ground color is a brownish-yellow, and the whole fish is ornamented with black or brown transverse bands or rounded spots. It is a littoral species, but adult specimens, which are from 10 to 15 feet long, are not rarely met far from land. It is easily recognized by its enormously long bladelike tail, which is half as long as the whole fish. The teeth are small, trilobed, in many series. The fourth and fifth gill-openings are close together.

The genus *Crossorhinus*, of which three species are known from the coasts of Australia and Japan, is remarkable as the only instance in this group of fishes in which the integuments give these inactive ground-sharks, whilst they lie concealed watching for their prey, what may be called a "celative" rather than a "protective" resemblance to their surroundings. Skinny frond-like appendages are developed near the angle of the mouth, or form a wreath round the side of the head, and the irregular and varied coloration of the whole body closely assimilates that of a rock cov-

[1] [Dr. J. F. Bransford, in *Reports for the Location of a Ship Canal through Nicaragua* (Washington, 1874), said that sharks were found in the lake of that name. Theodore Gill in Johnson's Cyclopædia (1878), vol. iv. p. 1596, says it is of the genus *Eulamia*, and adds, "another species of the same or allied genus occurs in a fresh-water lake of Manila."—AM. ED.]

ered with short vegetable and coralline growth. This peculiar development reminds us of the similar condition in the sea-devil (*Lophius*), where it serves also to conceal the fish from its prey, rather than to protect it from its enemies. The species of *Crossorhinus* grow to a length of 10 feet.

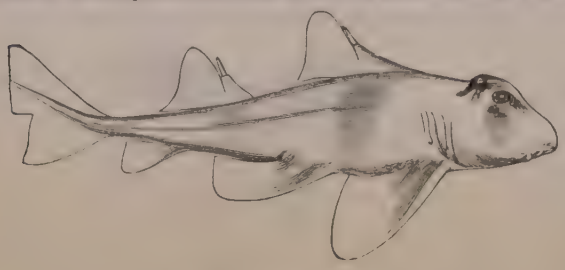

FIG. 6.—*Cestracion galeatus.*

The so-called Port Jackson Shark (*Cestracion*) is likewise a littoral form. Besides the common species (*C. philippi*), three other closely allied kinds from the Indo-Pacific are known. This genus, which is the only existing type of a separate family, is one of special interest, as similar forms occur in Primary and Secondary strata. The jaws are armed with small obtuse teeth in front, which in young individuals are pointed, and provided with from three to five cusps. The lateral teeth are larger, pad-like, twice as broad as long and arranged in oblique series (Fig. 7),—an arrangement admirably adapted for the prehension and mastication of crustaceans and hard-shelled animals. The fossil forms far exceeded in size the living, which scarcely attain to a length of 5 feet. The shells of their eggs are not rare in collections, being found thrown ashore like those of our dog-fishes. The shell is pyriform, with two broad lamellar ridges each wound edgewise five times round it (Fig. 8).

FIG. 7.—Upper Jaw of Port Jackson Shark (*Cestracion philippi*). ×½.

The Spiny or Piked Dog-Fish (*Acanthias*) inhabits, like the majority of littoral genera of sharks, the temperate seas of both the northern and southern hemispheres. For some part of the year it lives in deeper water than the sharks already noticed, but at uncertain irregular times it appears at the surface and close inshore in almost incredible numbers. Couch says that he has heard of 20,000 having been taken in a seine at one time; and in March, 1858, the newspapers reported a prodigious shoal reaching westward to Uig, whence it extended from 20 to 30 miles seaward, and in an unbroken phalanx eastward to Moray, Banff, and Aberdeen. In the deep fjords of Norway, and indeed at every station of which a shoal of these fishes has taken temporary possession, line-fishing has to be suspended during the time of their visit, as they cut the lines with their scissors-like teeth. As expressed by the name, these fishes are distinguished from the other British littoral sharks by each of the two dorsal fins being armed in front by an acute spine. They do not possess an anal fin. Their teeth are rather small, placed in a single series, with the point so much turned aside that the inner margin of the tooth forms the cutting edge (Fig. 9). The spiny dog-fish are of a grayish color with some whitish spots in young specimens, and attain to a length of 2 or 3 feet. They are viviparous, the young being produced throughout the summer months. It is stated that in the northern islands of Great Britain they are dried for food, and that their livers yield a large quantity of oil.

FIG. 8.—Egg-shell of same fish (× ½). I., external view; II., section; *a* and *b*, the two spiral ridges; *c*, cavity for the ovum.

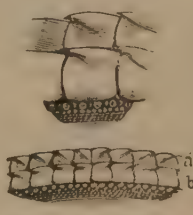

FIG. 9.—Teeth of *Acanthias vulgaris.*

Finally, we have to notice among the littoral sharks the "Angel-Fish" or "Monk-Fish" (*Rhina squatina*), which, by its broad flat head and expanded pectoral fins, approaches in general appearance the rays. It occurs in the temperate seas of the southern as well as the northern hemisphere, and is not uncommon on sandy parts of the coast of England and Ireland. It does not seem to exceed a length of 5 feet, is not used as food, and is too rare to do any perceptible injury to other fish. It is said to produce about twenty young at a birth.

Pelagic Sharks.—All these are of large size, and some are surpassed in bulk and length only by the larger kinds of cetaceans. Those armed with powerful cutting teeth are the most formidable tyrants of the ocean and dangerous to man, whilst others, which are provided with numerous but very small teeth, feed on small fishes only or marine invertebrates, and are other-

wise almost harmless and of a timid disposition, which causes them to retire into the solitudes of the open sea. On this account we know very little of their life; indeed, some are known from a few individuals only which have accidentally come ashore. All pelagic sharks have a wide geographical range, and many are found in all seas within the limits of the equatorial zone,—some being almost cosmopolitan. All seem to be viviparous.

Of the more remarkable forms which we propose to notice here the genus most abundantly represented in species and individuals is *Carcharias*. Perhaps nine-tenths of the sharks of which we read in books of travel belong to this genus. Between thirty and forty species have been distinguished, all of which are found in tropical seas. They are the sharks which so readily attach themselves to sailing vessels, following them for weeks, and thus exhibiting an endurance of muscular power scarcely found in any other class of animals. Others affect more the neighborhood of land, congregating at localities where nature or the vicinity of man provides them with an abundant supply of food. One of the most common species, and one of those which extends far into the temperate zones, is the Blue Shark (*Carcharias glaucus*), of which small specimens (4 to 6 feet long) are frequently caught on the south coasts of England and Ireland. Other species of *Carcharias* attain a length of 25 feet. The mouth of all is armed with a series of large flat triangular teeth, which have a sharp, smooth, or serrated edge (Fig. 10).

Fig. 10.—Dentition of the Blue Shark (*Carcharias glaucus*). The single teeth are of the natural size.

Galeocerdo is likewise a large shark very dangerous to man, differing from the preceding chiefly by having the outer side of its teeth deeply notched. It has long been known to occur in the North Atlantic, close to the Arctic Ocean (*G. arcticus*), but its existence in other parts has been ascertained within a recent period; in fact it seems to be one of the most common and dangerous sharks of the Indo-Pacific, the British Museum having obtained specimens from Mauritius, Kurrachee, Madras, and the west coast of Australia.

Hammerheaded Sharks (*Zygæna*) are sharks in which the anterior portion of the head is produced into a lobe on each side, the extremity of which is occupied by the eye. The relation of this unique configuration of the head to the economy of the fish is unknown. Otherwise these sharks resemble *Carcharias*, and are equally formidable, but seem to be more stationary in their habits. They occur in all tropical and subtropical seas, even in the Mediterranean, where *Z. malleus* is by no means rare. In the Indian Ocean it is common, and Cantor states that specimens of this species may be often seen ascending from the clear blue depths of the ocean like a great cloud.

The Porbeagles (*Lamna*) differ from the preceding sharks in their dentition (Fig. 11), the teeth being large, lanceolate in shape, not adapted for cutting, but rather for seizing and holding the prey, which consists chiefly in fish. These sharks are therefore not dangerous to man; at least there is no instance known of a person having been attacked by the species common on the British coast (*L. cornubica*). It grows to a length of 10 feet, and ranges to New Zealand and Japan. See vol. xix. p. 532.

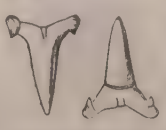

Fig. 11.—Teeth of *Lamna*.

To the genus *Carcharodon* particular interest is attached; because the single still existing species is the most formidable of all sharks, as were those which preceded it in Tertiary times. The existing species (*C. rondeletii*) occurs in almost all tropical and subtropical seas, but seems to be verging towards extinction. It is known to attain to a length of 40 feet. The tooth figured here of the natural size (Fig. 12) is

Fig. 12.—Tooth of *Carcharodon rondeletii*.

taken from a jaw much shrunk in drying, but still 20 inches wide in its transverse diameter, and taken from a specimen 36½ feet long. The extinct species must have been still more gigantic in bulk, as we may judge from teeth which are found in the crag or which have been dredged up from the bottom of the Pacific Ocean by the naturalists of the "Challenger" expedition, and which are 4 inches wide at the base and 5 inches long measured along their lateral margin. In some Tertiary strata these teeth are extremely abundant, so much so that—for instance, in Florida—the strata in which they occur are quarried to obtain the fossil remains for export to England, where they are converted into artificial manure.

The Fox-Shark or Thresher (*Alopecias vulpes*), of which every year specimens are captured on the British coast, but which is common in all the temperate seas of the northern and southern hemispheres, is readily recognized by its extremely slender tail, the length of which exceeds that of the remainder of the body. Its teeth are small, flat, triangular, and without serrature (Fig. 13; the single tooth is of the natural size). It follows the shoals of herrings, pilchards, and sprats in their migrations, destroying incredible numbers and frequently injuring the nets by getting entangled in them. When feeding it uses the long tail in splashing the surface of the water, whilst it swims in gradually

decreasing circles round a shoal of fishes which are thus kept crowded together, falling an easy prey to their enemy. Sometimes two threshers may be seen working together. Statements that it has been seen to attack whales and other large cetaceans rest upon erroneous observations; its dentition is much too weak to bite through their skin, although, as Couch says, by one splash

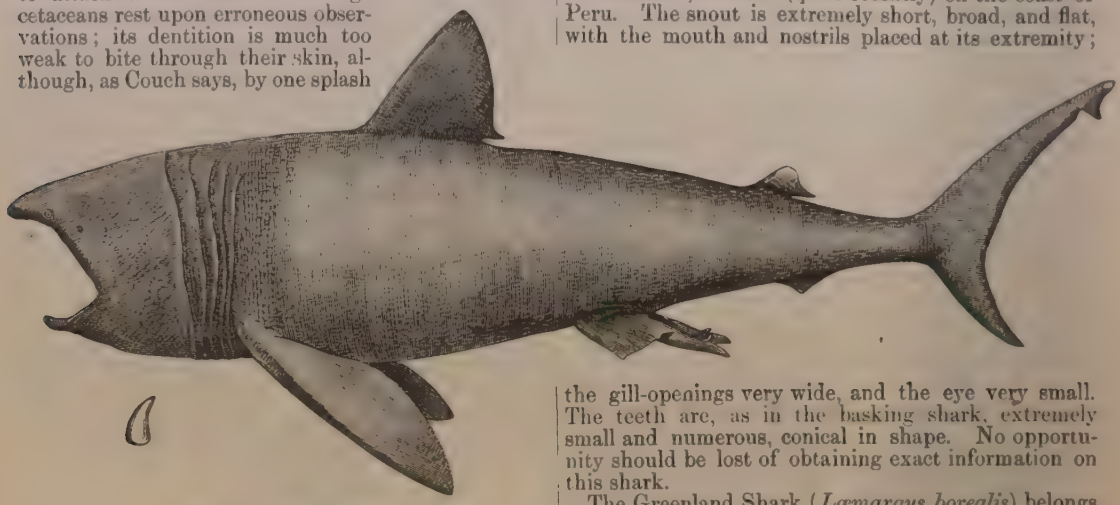

Fig. 13.—Basking Shark.

of its tail on the water it may put a herd of dolphins or porpoises to flight like so many hares. The same effect may be produced by the splash of an oar. The thresher attains to a length of 15 feet, the tail included.

The Basking Shark (*Selache maxima*), sometimes erroneously called "Sun-Fish," is the largest fish of the North Atlantic, growing to a length of more than 30 feet. It is one of the few types of sharks which up to a very recent time were considered to be peculiar to the North Atlantic fauna; but Prof. F. M'Coy has just recorded its occurrence on the Australian coast, a specimen 30 feet long having been captured in November, 1883, at Portland, on the west coast of Victoria. The mouth is of an extraordinary width, and, like the gill-cavity, capable of great expansion, so as to enable the fish to take at one gulp an enormous quantity of the small fish and other marine creatures on which it subsists. Also the gill-openings are of great width. The teeth are very small, numerous, arranged in several series, conical, and probably without use in feeding. This shark is therefore quite harmless if not attacked. On the west coast of Ireland, where it is frequently seen during the summer months, generally in companies, at a distance of from three to a hundred miles off the shore, it is chased by the more courageous of the fishermen for the sake of the oil which is extracted from the liver, one fish yielding from a ton to a ton and a half. Its capture is not unattended with danger, as one blow from the enormously strong tail is sufficient to stave in the sides of a large boat. The simple method used at present of harpooning the fish entails much patience and loss of time upon the captors, as the fish generally sinks to the bottom and sulks for many hours before it rises again in a more or less exhausted condition; and the use of more modern appliances could not fail of securing more speedy and better success. The basking shark is gregarious, and many individuals may be seen in calm weather lying together motionless, with the upper part of the back raised above the surface of the water, a habit which it has in common with the true sun-fish (*Orthagoriscus*), and from which it has derived its name.

A shark similar in many points to the basking shark (which it exceeds in size), and an inhabitant of the Indo-Pacific Ocean, is *Rhinodon typicus*. In fact, so far as our present knowledge goes, it is the largest of all sharks, as it is known to exceed a length of 50 feet, but it is stated to attain that of 70. The captures of only a few specimens are on record, viz., one at the Cape of Good Hope, one or two near the Seychelles, where it is known as the "chagrin," one on the coast of California, and one (quite recently) on the coast of Peru. The snout is extremely short, broad, and flat, with the mouth and nostrils placed at its extremity; the gill-openings very wide, and the eye very small. The teeth are, as in the basking shark, extremely small and numerous, conical in shape. No opportunity should be lost of obtaining exact information on this shark.

The Greenland Shark (*Læmargus borealis*) belongs to the same family as the spiked dog-fish, but grows to a much larger size, specimens 15 feet long being

Fig. 14.—Greenland Shark (*Læmargus borealis*).

frequently met with. The two dorsal fins are small and destitute of spines. The teeth (Fig. 11) in the upper jaw are small, narrow, conical in shape; those of the lower flat, arranged in several series, one on the top of the other, so that only the uppermost forms the sharp dental edge of the jaw. The points of these

Fig. 15.—Dentition of Greenland Shark.

lower teeth are so much turned aside that the inner margin only enters the dental edge. The Greenland shark is an inhabitant of the Arctic regions, sometimes straying to the latitudes of Great Britain and of Cape Cod in the western Atlantic; it is one of the greatest enemies of the whale, which is often found with large pieces bitten out of the tail by this shark. Its voracity is so great that, as Scoresby tells us, it is absolutely fearless in the presence of man whilst engaged in feeding on the carcass of a whale, and that it will allow itself to be stabbed with a lance or knife without being driven away.

The Spinous Shark (*Echinorhinus spinosus*) is readily recognized by the short bulky form of its body, its short tail, and the large round bony tubercles which are scattered all over its body, each of which is raised in the middle into a pointed conical spine. More frequent in the Mediterranean, it has been found also not very rarely on the English coasts and near the Cape of Good Hope. It is always living on the ground, and probably descends to some depth. It does not seem to exceed a length of 10 feet.

Bathybial Sharks.—Sharks do not appear to have yet reached the greatest depths of the ocean; and so far as we know at present we have to fix the limit of their vertical distribution at 500 fathoms. Those

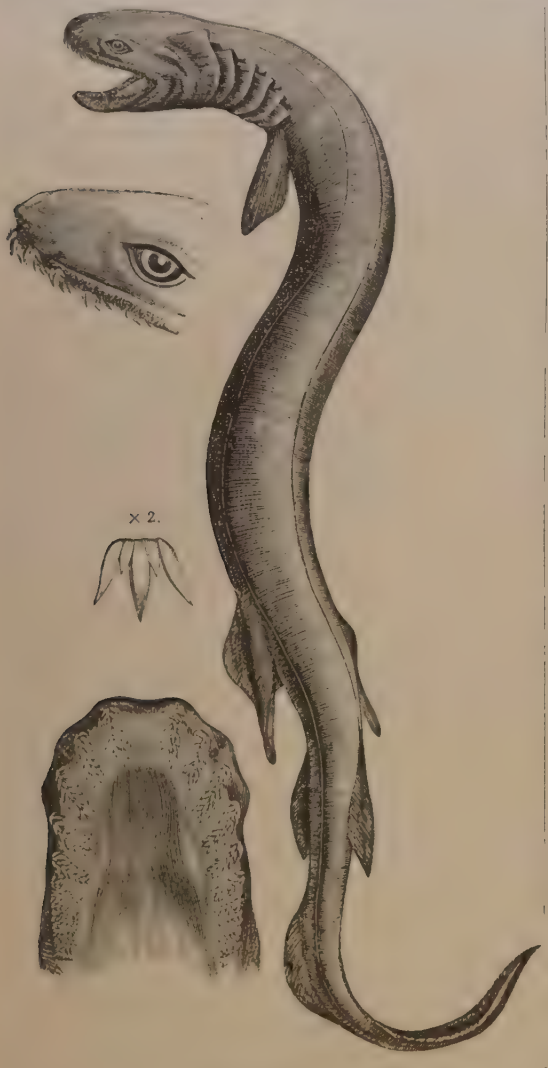

FIG. 16.—*Chlamydoselachus anguineus.*

which we find to have reached or to pass the 100 fathoms line belong to generic types which, if they include littoral species, are ground-sharks,—as we generally find the bottom-feeders of our littoral fauna much more strongly represented in the deep sea than the surface swimmers. All belong to two families only, the *Scylliidæ* and *Spinacidæ*, the littoral members of which live for the greater part habitually on the bottom and probably frequently reach to the 100 fathoms line. Distinctly bathybial species are two small dog-fishes,—*Spinax granulatus* from 120 fathoms, and *Scyllium canescens* from 400 fathoms, both on the southwest coast of South America; also *Centroscyllium granulatum* from 245 fathoms in the Antarctic Ocean, whose congener from the coast of Greenland probably descends to a similar depth. The sharks which reach the greatest depth recorded hitherto belong to the genus *Centrophorus*, of which some ten species are known, all from deep water in the North Atlantic, Mediterranean, the Molucca and Japanese seas. The Japanese species were discovered by the naturalists of the "Challenger" on the Hyalonema ground off Inosima in 345 fathoms. Dr. E. P. Wright found *C. cœlolepis* at a still greater depth on the coast of Portugal. The fishermen of Sétubal fish for these sharks in 400 or 500 fathoms, with a line of some 600 fathoms in length. "The sharks caught were from 3 to 4 feet long, and when they were hauled into the boat fell down into it like so many dead pigs;" in fact, on being rapidly withdrawn from the great pressure under which they lived they were killed, like other deep-sea fishes under similar circumstances. It is noteworthy that the organization of none of these deep-sea sharks has undergone such a modification as would lead us to infer that they are inhabitants of great depths.

One of the most interesting types of the division of sharks is the small family of *Notidanidæ*, which is externally distinguished by the presence of a single dorsal fin only, without spine and opposite to the anal, and by having six or seven wide branchial openings. They represent an ancient type, the presence of which in Jurassic formations is shown by teeth extremely similar to those of the living species. Their skeleton is notochordal. Only four species are known, of which one (*Notidanus griseus*) has now and then strayed northwards to the English coast. A member of this family has been recently discovered in Japan, and is so scarce that only two specimens are known—one in the museum at Cambridge, U. S., and the other in the British Museum. It was named by its first describer, S. Garman, *Chlamydoselachus anguineus* (Fig. 16). It resembles somewhat in shape a conger, and differs from the *Notidani* proper by its elongate body, wide lateral and terminal mouth, extremely wide gill-openings, and peculiarly formed teeth. The teeth are similar in both jaws, each composed of three slender curved cusps separated by a pair of rudimentary points, and with a broad base directed backwards. These teeth resemble some fossils of the Middle Devonian, described as *Cladodus*, and North-American naturalists regard, therefore, this fish as "the oldest living type of vertebrate." The *Notidani* are very probably ground-sharks, perhaps descending into deep water; and, although nothing positive is known at present of the habits of *Chlamydoselachus*, the fact that this singular type has escaped so long the observation of the numerous collectors in Japan renders it probable that it inhabits depths the exploration of which has been initiated only recently.

A few words have to be added with reference to the economic uses of this group of fishes. Their utility to man is insignificant in comparison with the havoc they commit among food-fishes and at fisheries, and with the loss of life which is caused by the larger kinds. As mentioned above, some of the smaller dog-fishes are eaten at certain seasons by the captors, and by the poorer classes of the population. An inferior kind of oil, chiefly used for the adulteration of cod-liver oil is extracted on some of the northern fishing-stations from the liver of the spiked dog-fishes, and occasionally of the larger sharks. Cabinetmakers make extensive use of shark's-skin under the name of "shagreen" for smoothing or polishing wood. This shagreen is obtained from species (such as our dog-fishes) whose skin is covered with small, pointed, closely-set, calcified papillæ, whilst very rough skins, in which the papillæ are large or blunt, are useless for this purpose. The dried fins of sharks (and of rays) form in India and China an important article of trade, the Chinese preparing gelatin from them, and using the better sort for culinary purposes. They are assorted in two kinds, viz., "white" and "black." The former consists exclusively of the dorsal fins, which are on both sides of the same light color, and reputed to yield more gelatin than the other fins. The pectoral,

ventral and anal fins constitute the "black" sort; the caudal are not used. One of the principal places where shark fishing is practiced as a profession is Kurrachee, and the principal kinds of sharks caught there are species of *Carcharias, Galeocerdo,* and *Zygæna.* Dr. Buist, writing in 1850, states that there are thirteen large boats, with crews of twelve men each, constantly employed in this pursuit, that the value of the fins sent to the market varies from 15,000 to 18,000 rupees ($7290 to $8748), that a boat will capture sometimes at a draught as many as a hundred sharks of various sizes, and that the number of sharks captured annually amounts probably to not less than 40,000. Large quantities are imported from the African coast and the Arabian Gulf, and various ports on the coast of India. In the year 1845–46 8770 cwt. of sharks' fins were exported from Bombay to China. (A. C. G.)

SHARON, a borough of the United States, in Mercer County, Pennsylvania, 14 miles west of Mercer, is the seat of considerable iron manufacture, with blast furnaces, rolling mills, foundries, and nail factories, and had in 1880 a population of 5684.

SHARP, James (1618–1679), archbishop of St. Andrews, was the son of William Sharp, sheriff-clerk of Banffshire and of Isabel Leslie, daughter of Leslie of Kininvie, of the family of Halyburtons of Pitcur in Angus, and was born in Castle Banff on May 4, 1618. He was a clever boy and his early disposition for the church led to his being called in jest "the young minister." In 1633 he went to King's College, Aberdeen, and graduated in 1637. He there studied divinity for one or two years, and probably derived his Episcopal tendencies from the "Aberdeen doctors," Aberdeen being at that time the home of Episcopal sentiment. On the outbreak of the Covenanting war he went to England (1639) and visited Oxford and perhaps Cambridge, becoming acquainted with the principal English divines. Upon his return he was chosen in 1643 through the influence of Lord Rothes to be one of the "regents" of philosophy in St. Leonard's College, St. Andrews. He appears to have continually risen in reputation until in December, 1647, he went through his ordinary trials for the ministerial office before the Presbytery of St. Andrews, and was appointed minister of Crail, in Fifeshire, on the presentation of the Earl of Crawford, on January 27, 1648. In the great schism of Resolutioners and Protestors, he, with the large majority of educated men, took active part with the former; he was the friend of Baillie, Douglas, Dickson, Wood, Blair and others, and as early as March, 1651, was recognized as one of the leading men of the party. His first public employment was in 1656 when he went to London on their behalf to endeavor to counteract with the Protector the influence of Warriston, who was acting for the Protestors. Here he became acquainted with Calamy, Ash, and other leading London Presbyterian ministers, and letters passed between him and Lauderdale, then prisoner in the Tower. He displayed all his undoubted talents for petty diplomacy and considerable subtlety in argument while on this service, and his mission was decidedly successful. He returned to Scotland in 1659, but upon Monk's march to London was again, in February, 1660, sent by the Resolutioners to watch over their interests in London, where he arrived on February 13. He was most favorably received by Monk, to whom it was of great importance to remain on good terms with the dominant party in Scotland. His letters to Douglas and others during this period, if they may be trusted, are useful towards following the intrigues of the time day by day. It must not be forgotten, however, that there is good reason for thinking that Sharp had already made up his mind not to throw away the chances he might have of prominent employment under the Restoration. In the beginning of May he was despatched by Monk to the king at Breda "to deal that he may be sent with a letter to the London Presbyterian ministers, showing his resolution to own the godly sober party." His letters on this occasion to Douglas show that he regarded himself equally as the emissary of the Scottish kirk. It is to be noticed that he was also the bearer of a secret letter from Lauderdale to the King. He was in fact playing a game admirably suited to his peculiar capacity for dark and crooked ways of dealing. There can be little doubt that while on this mission he was finally corrupted by Charles and Clarendon, not indeed so far as to make up his mind to betray the kirk, but at any rate to decide in no way to imperil his own chances by too firm an integrity. The first thing that aroused the jealousy of his brethren, who, as Baillie says, had trusted him as their own souls, was his writing from Holland in commendation of Clarendon. This jealousy was increased on his return to London (May 26) by his plausible endeavors to stop all coming of Presbyterian commissioners from Scotland and Ireland, though he professed to desire the presence of Douglas and Dickson, by his urgent advice that the Scots should not interfere in the restoration of Episcopacy in England, and by his endeavors to frustrate the proposed union of Resolutioners and Protestors. He informed them that Presbyterianism was a lost cause in England, but as late as August 11 he intimated that, though there had been great danger for the Scottish kirk as well, this danger had been constantly and successfully warded off by his efforts. He returned to Scotland in this month and busied himself in endeavoring to remove all suspicions of his loyalty to the kirk; but at the same time he sucessfully stopped all petitions from Scottish ministers to king, parliament, or council. His letters to Drummond, a Presbyterian minister in London, and to Lauderdale, without absolutely committing him, show clearly that he was certain that Episcopacy was about to be set up. How far he was actively a traitor in the matter has always been fairly disputed until the question was at last set at rest by the discovery of his letter, dated May 21, from London, whither he went in April, 1661, to Middleton, the High Commissioner, whose chaplain he now was, from which it is proved that he was in confidential communication with Clarendon and the English bishops, that he was earnestly and eagerly coöperating in the restoration of Episcopacy in Scotland, that he had before leaving Scotland held frequent conferences with Middleton on the subject (a fact which he had explicitly and vehemently denied) and was aware that Middleton had all along intended it, and that he drew up and was directly responsible for the quibbling proclamation of June 10, the sole purpose of which was "the disposing of minds to acquiesce in the king's pleasure." The original of this letter (which is printed in the *Lauderdale Papers* and in the *Scottish Review*) is preserved in the Museum of the Society of Antiquaries, Edinburgh. It should be noticed that as late as the end of April, on the eve of starting on his mission to court with Rothes and Glencairne, he declared to Baillie that no change in the kirk was intended. The mask was at length dropped in August, when Episcopacy was restored and Sharp was appointed Archbishop of St. Andrews. He and Leighton, Fairfoul and Hamilton "were dubbed, first preaching deacons, then presbyters, and then consecrated bishops in one day, by Dr. Sheldon and a few others." On April 8th the new prelates entered Scotland, and on the forenoon of April 20, 1662, Sharp preached his first sermon at St. Andrews.

Sharp had carefully kept on good terms with Lauderdale, and when the Billeting Plot was concocted in September, 1662, against the latter by Middleton, he managed to avoid acting against him; indeed it is probable that, after being appointed under an oath of secrecy to be one of the scrutineers of the billets, he, in violation of the oath, was the cause of Lauderdale receiving timely information of the decision against him; and yet he shortly went up to London to explain the whole affair in Middleton's interest. When Lauderdale's supremacy was established he readily coöperated in passing the National Synod Act in 1663, the first step in the intended subjection of the church

to the crown. In 1664 he was again in London, returning in April, having secured the grant of a new church commission. His vanity also had been gratified by his being allowed to take precedence of the chancellor at the council. He harassed the ministers who were with his old friend James Wood when he signed his well-known deathbed confession; he cited and fined others, as well as laymen, for withdrawing from the churches; he urged the thorough prosecution of the arbitrary powers granted to the commission, and complained of the slackness of his fellow commissioners. So oppressive was his conduct and that of others of the bishops that it called forth a written protest from Gilbert Burnet. Sharp at once summoned him before the bishops and endeavored to obtain a sentence of deprivation and excommunication against him, but was overruled by his brethren. On the death of Glencairne, the chancellor's greatest efforts were made to secure the vacant office for Sharp, and he was not inactive in his own interest; the place was not, however, filled up until 1667, and then by the appointment of Rothes. He was in strict alliance with Rothes, Hamilton, and Dalyell, and the other leaders of oppression, and now placed himself in opposition to the influence of Lauderdale, attacking his friends, and especially the earl of Kincardine. In 1665 he was again in London, where, through his own folly and mendacity, he suffered a complete humiliation at the hands of Lauderdale, well described by the historian Burnet. With Rothes he now in great part governed Scotland, and the result of their system of violence and extortion was the rising of the Covenanters, during which, being in temporary charge during Rothes's absence, he showed, according to Bellenden, the utmost fear, equalled only by his cruelty to the prisoners after the rout of Pentland. When the convention of estates met in January, 1667, he received his first rebuff, Hamilton being substituted for him as president. He now tried to curry favor with Lauderdale, to whom he wrote letters of the most whining contrition, and who extended him a careless reconciliation. The expressions of contempt for him which occur at this time, as previously, in the letters of Robert Moray, Argyll, and others of Lauderdale's correspondents, are frequent and very amusing. For a time he made himself actively useful, and was instrumental in restraining his brethren from writing to London to complain of the conciliation policy which for a while Lauderdale carried out, a transaction in which he displayed the utmost effrontery of lying; and, with slight attempts to free himself, he continued faithful in his new service. On July 10, 1668, an attempt was made upon his life by Robert Mitchell, who fired a pistol at him while driving through the streets of Edinburgh. The shot, however, missed Sharp, though his companion the bishop of Orkney was wounded by it, and Mitchell for the time escaped. In August Sharp went up to London, returning in December, and with his assistance, nominally indeed at his suggestion, Tweeddale's tolerant proposals for filling the vacant parishes with some of the "outed" ministers were carried out. In the debates on the Supremacy Act, by which Lauderdale destroyed the autonomy of the church, he at first showed reluctance to put in motion the desired policy, but gave way upon the first pressure. When, however, Leighton, as archbishop of Glasgow, endeavored to carry out a comprehension scheme, Sharp actively opposed him, and expressed his joy at the failure of the attempt. From this time he was completely subservient to Lauderdale, who had now finally determined upon a career of oppression, and in 1674 he was again in London to support this policy. In this year also Mitchell, who had shot at him six years before, was arrested, Sharp himself having recognized him, and, upon Sharp's promise to obtain a pardon, privately made a full confession. When brought into the justiciary court, however, he refused to repeat the confession, whereupon the promise of pardon was recalled; the prisoner was sent to the Bass, and was not brought to trial for four years. In 1678, however, the country being again in great disorder, he was tried on his own confession, which, not having been made before judges, could not legally be brought against him. This plea being overruled, he claimed the promise of pardon. Sharp, however, basely denied that any such promise had been given. His falsehood was proved by the entry of the act in the records of the court. Mitchell was finally condemned, but the condemnation was so evidently unfair and contrary to solemn promise that a reprieve would have been granted had not Sharp himself insisted on his death. This, perhaps the basest action of his base life, was speedily avenged. On May 3, 1679, as he was driving with his daughter Isabel to St. Andrews, he was set upon by nine men, who were looking for one of the instruments of his cruelty, and, in spite of unmanly beseechings and of the appeals of his daughter, was cruelly murdered. The place of the murder, on Magus Muir, now covered with fir trees, is marked by a monument erected by Dean Stanley, with a Latin inscription recording the deed. It is only right, while recording a career of cold-blooded cruelty and almost unexampled political baseness, to remember that no charge that can be seriously maintained has ever been brought against the morality of Sharp's private life.

Unless otherwise mentioned, the proofs of the statements in this article will be found in vols. i. and ii. of the *Lauderdale Papers* (Camden Society) and in two articles in the *Scottish Review*, July, 1884, and January, 1885. (O. A.)

SHARP, William (1749–1824), an eminent line-engraver, was born at London on the 29th of January, 1749. He was originally apprenticed to what is called a bright engraver, and practiced as a writing engraver, but, gradually becoming inspired by the higher branches of the engraver's art, he exercised his gifts with surprising success on works of the old masters. Among his earlier plates are some illustrations, after Stothard, for the *Novelists' Magazine*. He engraved the Doctors Disputing on the Immaculateness of the Virgin and the Ecce Homo of Guido Reni, the St. Cecilia of Domenichino, the Virgin and Child of Dolci, and the portrait of John Hunter of Sir Joshua Reynolds. His style of engraving is thoroughly masterly and original, excellent in its play of line and rendering of half-tints and of "color." He died at Chiswick on the 25th July, 1824. In his youth Sharp was a violent republican, and, owing to his hotly expressed adherence to the politics of Paine and Horne Tooke, he was examined by the privy council on a charge of treason. He was also one of the greatest visionaries in matters pertaining to religion. No imposture was too gross for him to accept, no deception too glaring for his eyes to admire. The dreams of Mesmer and the rhapsodies of Brothers found in Sharp a stanch believer; and for long he maintained Joanna Southcott at his own expense. As an engraver he achieved a European reputation, and at the time of his death he enjoyed the honor of being a member of the Imperial Academy of Vienna and of the Royal Academy of Munich.

SHAWL, a square or oblong article of dress worn in various ways dependent from the shoulders. The term is of Persian origin (*shál*), and the article itself is most characteristic and important in the dress of the natives of northwestern India and Central Asia; but in various forms, and under different names, essentially the same piece of clothing is found in most parts of the world. The shawls made in Kashmir occupy a preëminent place among textile products; and it is to them and their imitations from Western looms that specific importance attaches. The Kashmir shawl is characterized by the great elaboration and minute detail of its design, in which the "cone" pattern is a prominent feature, and by the glowing harmony, brilliance, depth, and enduring qualities of its colors. The basis of these excellences is found in the raw material of the shawl

manufacture, which consists of the very fine, soft, short, flossy under-wool, called pashm or pashmina, found on the shawl-goat, a variety of *Capra hircus* inhabiting the elevated regions of Tibet. There are several varieties of pashm, according to the districts in which it is produced, but the finest is a strict monopoly of the maharaja of Kashmir, through whose territory it comes. Inferior pashm and Kirman wool—a fine soft Persian sheep's wool—are used for shawl weaving at Amritsar and other places in the Punjab, where colonies of Kashmiri weavers are established; but just in proportion to the quality of the pashm used are the beauty and value of the resulting shawl. In Kashmir the shawl wool is sorted with patient care by hand, and spun into a fine thread, a work of so much delicacy, owing to the shortness of the fibre, that a pound of undyed thread may be worth £2, 10s. [$12.15]. The various colors, costly and permanent, are dyed in the yarn. The subsequent weaving or embroidering is a work of great labor, and a fine shawl will occupy the whole labor of three men not less than a year. Thus a first-rate shawl weighing about 7 lb may cost at the place of its production £300 [$1458], made up thus: material £30 [$145.80], labor £150 [$729], duty £70 [$340.20], miscellaneous expenses, £50 [$243]. In shawl cloth many varieties of dress articles are made; but of shawls themselves, apart from shape and pattern, there are only two principal classes: (1) loom-woven shawls called tiliwalla, talikár or káni kár,—sometimes woven in one piece, but more often in small segments which are sewn together with such precision and neatness that the sewing is quite imperceptible (such loom-woven shawls have borders of silk, the weight and stiffness of which serve to stretch the shawl and make it set properly); and (2) embroidered shawls —amlikár,—in which over a ground of plain pashmina is worked by needle a minute and elaborate pattern. A large proportion of the inhabitants of Srinagar, the capital of Kashmir, are engaged in the shawl industry; and there are numerous colonies of Kashmiri weavers settled at Amritsar, Ludianah, Nurpur, and other towns in the Punjab. Amritsar is now the principal entrepôt of the shawl trade between India and Europe. Imitation Kashmir shawls are made at Lyons, Nîmes, Norwich, and Paisley, and some of the products of these localities are little inferior in beauty and elaboration to Oriental shawls; but owing to the fluctuations of fashion there has been little demand for the finer products of European looms for many years. See also PERSIA, vol. xviii. p. 637.

SHEA BUTTER. See OILS, vol. xvii. p. 768.

SHEARWATER, the name of a bird first published in Willughby's *Ornithologia* (p. 252), as made known to him by Sir T. Browne, who sent a picture of it with an account that is given more fully in Ray's translation of that work (p. 334), stating that it is "a Sea-fowl, which fishermen observe to resort to their Vessels in some numbers, swimming[1] swiftly to and fro, backward, forward, and about them, and doth as it were *radere aquam*, shear the water, from whence perhaps it had its name."[2] Ray's mistaking young birds of this kind obtained in the Isle of Man for the young of the Coulterneb, now usually called PUFFIN, has already been mentioned under that heading (vol. xx. p. 107); and not only has his name *Puffinus anglorum* hence become attached to this species, commonly described in English books as the Manx Puffin or Manx Shearwater, but the barbarous and misapplied word *Puffinus* has come into regular use as the generic term for all birds thereto allied, forming a well-marked group of the Family *Procellariidæ* (*cf.* PETREL, vol. xviii. p. 725), distinguished chiefly by their elongated bill, and numbering some twenty species, if not more —the discrimination of which, owing partly to the general similarity of some of them, and partly to the change of plumage which others through age are believed to undergo, has taxed in no common degree the ingenuity of those ornithologists who have ventured on the difficult task of determining their characters. Shearwaters are found in nearly all the seas and oceans of the world,[3] generally within no great distance from the land, though rarely resorting thereto, except in the breeding-season. But they also penetrate to waters which may be termed inland, as the Bosphorus, where they have long attracted attention by their daily passage up and down the strait, in numerous flocks, hardly ever alighting on the surface, and from this restless habit they are known to the French-speaking part of the population as *âmes damnées*, it being held by the Turks that they are animated by condemned human souls. Four species of *Puffinus* are recorded as visiting the coasts of the United Kingdom; but the Manx Shearwater aforesaid is the only one that at all commonly occurs or breeds in the British Islands. It is a very plain-looking bird, black above and white beneath, and about the size of a Pigeon. Some other species are considerably larger, while some are smaller, and of the former several are almost whole-colored, being of a sooty or dark cinereous hue both above and below. All over the world Shearwaters seem to have precisely the same habits, laying their single purely white egg in a hole under ground. The young are thickly clothed with long down, and are extremely fat. In this condition they are thought to be good eating, and enormous numbers are caught for this purpose in some localities, especially of a species, the *P. brevicaudus* of Gould, which frequents the islands off the coast of Australia, where it is commonly known as the "Mutton-bird." For works treating of the Shearwaters, see those cited under PETREL (vol. xviii. p. 725). (A. N.)

SHEATHBILL, a bird so-called by Pennant in 1781 (*Gen. Birds*, ed. 2, p. 43) from the horny case[4] which ensheaths the basal part of its bill. It was first made known from having been met with on New-Year Island, off the coast of Staten Land, where Cook anchored on New Year's eve, 1774.[5] A few days later he discovered the islands that now bear the name of South Georgia, and there the bird was again found,—in both localities frequenting the rocky shores. On his third voyage, while seeking some land reported to have been found by Kerguelen, Cook in December, 1776, reached the cluster of desolate islands now generally known by the name of the French explorer, and here, among many other kinds of birds, was a Sheathbill, which for a long while no one suspected to be otherwise than specifically identical with that of the western Antarctic Ocean; but, as will be seen, its distinctness has been subsequently admitted.

The Sheathbill, so soon as it was brought to the notice of naturalists, was recognized as belonging to a genus hitherto unknown, and the elder Forster in 1788 (*Enchiridion*, p. 37) conferred upon it, from its snowy plumage, the name *Chionis*, which has most properly received general accept-

[1] By mistake, no doubt, for flying or "hovering," the latter the word used by Browne in his *Account of Birds found in Norfolk* (Mus. Brit. MS. Sloane, 1830, fol. 5, 22 and 31), written in or about 1662. Edwards (*Gleanings*, iii. p. 315) speaks of comparing his own drawing "with Browne's old draught of it, still preserved in the British Museum," and thus identifies the latter's "Shearwater" with the "Puffin of the Isle of Man."

[2] *Lyric* appears to be the most common local name for this bird in Orkney and Shetland; but *Scraib* and *Scraber* are also used in Scotland. These are from the Scandinavian *Skraape* or *Skrofa*, and considering Prof. Skeat's remarks (*Etym. Dictionary*, p. 546) as to the alliance between the words *shear* and *scrape* it may be that Browne's hesitation as to the derivation of "Shearwater" had more ground than at first appears.

[3] The chief exception would seem to be the Bay of Bengal and thence throughout the western part of the Malay Archipelago, where, though they may occur, they are certainly uncommon.

[4] A strange fallacy arose early, and of course has been repeated late, that this case or sheath was movable. It is absolutely fixed.

[5] Doubtless some of the earlier voyagers had encountered it, as Forster suggests (*Descr. Animalium*, p. 330) and Lesson asserts (*Man. d'Ornithologie*, ii. p. 343); but for all practical purposes we certainly owe its discovery to the naturalists of Cook's second voyage. By some error, probably of transcription, New Zealand, instead of New-Year Island, appears in many works as the place of its discovery, while not a few writers have added thereto New Holland. Hitherto there is no real evidence of the occurrence of a Sheathbill in the waters of Australia or New Zealand.

ance, though in the same year the compiler Gmelin termed the genus *Vaginalis*, as a rendering of Pennant's English name, and the species *alba*. It has thus become the *Chionis alba* of ornithology. It is about the size of and has much the aspect of a Pigeon;[1] its plumage is pure white, its bill somewhat yellow at the base, passing into pale pink towards the tip. Round the eyes the skin is bare, and beset with cream-colored papillæ, while the legs are bluish-gray. The second or eastern species, first discriminated by Dr. Hartlaub (*Rev. Zoologique*, 1841, p. 5; 1842, p. 402, pl. 2)[2] as *C. minor*, is smaller in size, with plumage just as white, but having the bill and bare skin of the face black and the legs much darker. The form of the bill's "sheath" in the two species is also quite different, for in *C. alba* it is almost level throughout, while in *C. minor* it rises in front like the pommel of a saddle. Of the habits of the western and larger species not much has been recorded. It gathers its food, consisting chiefly, as Darwin and others have told us, of sea-weeds and shell-fish, on rocks at low water; but it is also known to eat birds' eggs. There is some curiously conflicting evidence as to the flavor of its flesh, some asserting that it is wholly uneatable, and others that it is palatable,—a difference which may possibly be due to the previous diet of the particular example tasted, to the skill of the cook, or the need of the taster. Though most abundant as a shore-bird, it is frequently met with far out at sea, and its most northern recorded limit is by Fleurieu (*Voy. de Marchand*, i. p. 19), in lat. 44° S., some 260 miles from the eastern coast of Patagonia. It is not uncommon on the Falkland Isles where it is said to breed (*Ibis*, 1861, p. 154), though confirmation of the report is as yet wanting, and from thence is found at both extremities of the Strait of Magellan, and southward to Louis-Philippe Land in lat. 60° S. On the other hand, thanks to the naturalists of the British and United States expeditions to Kerguelen Land for the observation of the transit of Venus in 1874, especially Mr. Eaton (*Philos. Transactions*, clxviii. pp. 103–105) and Dr. Kidder (*Bull. U. S. National Museum*, 1875, No. 2, p. 1–4), much more has been recorded of the eastern and smaller species, which had already been ascertained by Mr. Layard (*Proc. Zool. Society*, 1871, p. 57, pl. iv. fig. 7) to breed on the Crozet Islands,[3] and was found to do so still more numerously on Kerguelen, while it probably frequents Prince Edward's Islands for the same purpose. The eggs, of which a considerable number have now been obtained, though of peculiar appearance, bear an unmistakable likeness to those of some Plovers, while occasionally exhibiting a resemblance —of little significance, however—to those of the Tropic-birds.

The systematic position of the Sheathbills has been the subject of much hesitation—almost useless since 1836, when De Blainville (*Ann. Sc. Naturelles*, ser. 2, vi. p. 97) made known certain anatomical facts proving their affinity to the OYSTER-CATCHERS (vol. xviii. p. 114), though pointing also to a more distant relationship with the GULLS (vol. xi. p. 242). These he afterwards described more fully (*Voy.* "*Bonite*," *Zoologie*, i. pt. 3, pp. 107–132, pl. 9), so as to leave no doubt that *Chionis* was a form intermediate between those groups. Yet some writers continued to refer it to the *Gallinæ* and others to the *Columbæ*. The matter may now be regarded as settled forever. In 1876 Dr. Reichenow in Germany (*Jour. f. Orn.*, 1876, pp. 84–89) and in America Drs. Kidder and Coues (*Bull. U. S. Nat. Museum*, No. 3, pp. 85–116) published elaborate accounts of the anatomy of *C. minor*, the first wholly confirming the view of De Blainville, the last two[4] agreeing with him in the main, but concluding that the Sheathbills formed a distinct group *Chionomorphæ*, in rank equal to the *Cecomorphæ* and *Charadriomorphæ* of Prof. Huxley (which are, to speak roughly, the *Gaviæ* and *Limicolæ* of older systematists), and regarding this group as being "still nearer the common ancestral stock of both." These authors also wish to separate the two species generically; but their proposals are considered needless by Garrod (*P. Z. S.*, 1877, p. 417) and M. Alph. Milne-Edwards (*Ann. Sc. Naturelles*, ser. 6, xiii. art. 4, p. 24). The opinions of De Blainville and Dr. Reichenow are borne out by the observations of Mr. Eaton (*loc. cit.*), and no one knowing the habits of an Oyster-catcher can read his remarks without seeing how nearly related the two forms are. Their differences may perhaps justify the separation of each form into what is vaguely called a "Family," but the differences will be seen by the comparative anatomist to be of slight importance, and the intimate affinity of the *Gaviæ* and *Limicolæ*, already recognized by Prof. Parker and some of the best taxonomers (*cf.* ORNITHOLOGY, vol. xviii. p. 49) is placed beyond dispute.[5] (A. N.)

SHEBA. See YEMEN.

SHEBOYGAN, a city of the United States, capital of Sheboygan county, Wisconsin, stands on Lake Michigan, at the mouth of the river of the same name, 43 miles east of Fond du Lac and 52 miles north of Milwaukee. It possesses a good harbor, and, being surrounded by very productive agricultural land, exports annually a large quantity of grain. The manufactures include farming implements, enamelled hollow-ware, and stone-ware; there are a number of tanneries and breweries; and mineral water is exported. Settled in 1836, the city had in 1880 a population of 7314.

SHECHEM, now NÁBULUS, a city of Palestine. Eleven hours from Jerusalem on the great north road the traveller finds himself in the broad upland plain of Makhna (1500 feet above the sea[6]), with Mount Gerizim on his left, and, skirting the base of the mountain, reaches the traditional well of Jacob (John iv. 5, 6; *cf.* Gen. xxxiii. 19), a deep cistern with the ruins of an old church beside it. Here the road divides: the caravan route to Damascus continues northward by the village of 'Asker (Sychar of John iv. 5?), and so to Beisán (Beth-shan) and Tiberias; but the way to Samaria turns westward into a fertile and well-watered side valley between Gerizim (2849 feet) on the south and Ebal (3077 feet) on the north. This is the Vale of Shechem or Nábulus; it is in fact an easy pass between the Mediterranean and Jordan basins, and at the watershed (1870 feet), where the city stands, 1¼ miles from Jacob's Well, is not more than 100 yards wide. Thus Shechem commands both branches of the great north road, and several routes from the coast also converge here and connect with the ancient road from Shechem eastward to Keráwá (Archelais) and Al-Salt, the capital of the Belká. The name of Shechem (shoulder, back) accords with the position of the town on the watershed, and the native name in Josephus's time (Mabortha, *B. J.*, iv. 8. 1; Pliny has Mamortha) means simply "the pass." The situation of Shechem at the crossing of so many great roads must have given it importance at a very early date, and it is still a busy town of 20,000 inhabitants, with soap manufactures and considerable trade. On the other hand, the position is equally favorable for brigandage, to which, under weak governments, the Shechemites were addicted of old (Judges ix. 25; Hosea vi. 9, where "for consent" read "to Shechem"), and the district is still a lawless one.

The ancient inhabitants of Shechem were the Bne Hamor, a Canaanite clan, who were not expelled on the first con-

[1] In the Falkland Isles it is called the "Kelp-Pigeon," and by some of the earlier French navigators the "Pigeon blanc antarctique." The cognate species of Kerguelen Land is named by the sealers "Sore-eyed Pigeon," from its prominent fleshy orbits, as well as "Paddy-bird"—the last doubtless from its white plumage calling to mind that of some of the smaller Egrets, so-called by the English in India and elsewhere.

[2] Lesson (*loc. cit.*) cites a brief but correct indication of this species as observed by Lesquin (*Lycée Armoricain*, x. p. 36) on Crozet Island, and, not suspecting it to be distinct, was at a loss to reconcile the discrepancies of the latter's description with that given of the other species by earlier authors.

[3] A previous announcement of the discovery of its egg (*Ibis*, 1867, p. 458) was premature, the specimen, now in the possession of the present writer, proving to be that of a Gull—a fact unknown to the American writer named above.

[4] In some details their memoir is unfortunately inaccurate.

[5] The little group of very curious birds, having no English name, of the genera *Thinocorys* and *Attagis*, which are peculiar to certain localities in South America and its islands, are by some systematists placed in the Family *Chionididæ* and by others in a distinct Family *Thinocoridæ* (more correctly *Thinocorythidæ*). They are undoubtedly Limicoline, though having much the aspect of Sand-Grouse, but their precise position and rank remain at present uncertain. *Cf.* Garrod (*ut supra*) and Prof. Parker (*Trans. Zool. Soc.*, x. pp. 301 *sq.*).

[6] [Vol. xviii., p. 176, PALESTINE gives 1600 to 1800 as the height of this plain.—AM. ED.]

quest of Canaan but remained in possession till the events recorded in Judges ix. From the narrative of Gen. xxxiv., which has been spoken of in the article LEVI, it would seem that they entered into friendly relations with the invaders, and that an attack made on them by Simeon and Levi was repudiated by Israel and led to the dispersion of these two tribes. In Judges ix. the "freemen of Shechem" (בעלי שכם) appear as a turbulent but cowardly race, who, in spite of their numbers and wealth, had become vassals of Gideon for the sake of protection against the Midianites, and would have continued to serve his sons but for the enterprise of Abimelech, whose mother was of their race. With the aid of mercenaries hired with the treasure of the sanctuary of Baal-Berith or El-Berith, the god of the town, Abimelech destroyed the sons of Gideon, was crowned king of Shechem, and for three years held sway also over the surrounding Israelites. A revolt was led by Gaal, an Israelite who scorned to be subject to the creature of the despised Canaanites,[1] and, the Shechemites having fallen out with Abimelech about their practice of brigandage, Gaal made a dash at the city in the absence of the king, and the fickle inhabitants received him with open arms. Abimelech, however, with his mercenaries proved too strong for his adversaries, and Canaanite Shechem was utterly destroyed. Its place was taken by a Hebrew city, and the Canaanite sanctuary of El-Berith was transformed into a Hebrew holy place of El the God of Israel, of which the foundation was afterwards referred to Jacob (Gen. xxxiii. 20) or even to Abraham (Gen. xii. 7). The great stone under the famous sacred tree at the sanctuary (the "tree of the revealer" or "tree of the soothsayers," E.V. "plain of Moreh" or "of Meonenim;" Gen. xii. 6, xxxv. 4;[2] Deut. xi. 30; Jud. ix. 6, 37) was said to have been set up by Joshua (Josh. xxiv. 26), and Joseph's grave was shown there.[3] All this indicates that Shechem was once the chief sanctuary of Joseph, and so we understand why Rehoboam went to Shechem to be crowned king of Northern Israel and why Jeroboam at first made it his residence (1 Kings xii. 25). Politically Shechem was soon supplanted by Tirzah and Samaria, but it appears to have been still a sanctuary in the time of Hosea. It survived the fall of Ephraim (Jer. xli. 5) and ultimately became the religious centre of the SAMARITANS (*q.v.*). The Greek name Neapolis, known to Josephus, indicates the building of a new town, which, according to Eusebius and Jerome, was a little way from the old Shechem, or at least did not include the traditional holy sites. The coins give the form Flavia Neapolis. Neapolis was the birthplace of Justin Martyr, and became the seat of a bishopric. Five Christian churches destroyed by the Samaritans in the time of Anastasius were rebuilt by Justinian (Procop., *De Ædi.*, v. 7). Remains of one of these seem still to exist in the crusaders' church of the Passion and Resurrection (1167), now the great mosque. Neapolis had much to suffer in the crusades; it was finally lost to the Christians soon after Saladin's great victory at Hittîn.

A map of the Shechem valley, with topographical details, etc., will be found in the *Memoirs* of Pal. Expl. Soc., vol. ii.

SHEE, SIR MARTIN ARCHER (1770–1850), portrait-painter, and president of the Royal Academy, was born in Dublin on the 23d of December, 1770. He was sprung from an old Irish family, and his father, while he exercised the trade of a merchant, regarded the profession of a painter as in no sense a fit occupation for a descendant of the Shees. Young Shee became, nevertheless, a student of art in the Dublin Society, and came early to London, where he was, in 1788, introduced by Burke to Reynolds, by whose advice he studied in the schools of the Royal Academy. In 1789 he exhibited his first two pictures, the Head of an Old Man and Portrait of a Gentleman. During the next ten years he steadily increased in practice, and gradually gained ground among the aristocracy, with whom his suavity and good manners were great recommendations. He was chosen an associate of the Royal Academy in 1798, shortly after the illustrious Flaxman, and in 1800 he was made a Royal Academician. In the former year he had married, removed to Romney's house in Cavendish Square, and set up as the legitimate successor of that artist. Shee continued to paint with great readiness of hand and fertility of invention, although his portraits were eclipsed by more than one of his contemporaries, and especially by Lawrence, Hoppner, Phillips, Jackson, and Raeburn. In addition to his portraits he executed various subjects and historical works, such as Lavinia, Belisarius, his diploma picture Prospero and Miranda, and the daughter of Jephthah. In 1805 he published a poem consisting of *Rhymes on Art*, and it was succeeded by a second part in 1809. Although Byron spoke well of it in his *English Bards and Scotch Reviewers*, and invoked a place for "Shee and genius" in the temple of fame, yet, as nature had not originally conjoined these two, it is to be feared that even a poet's invocation could not materially affect their relations. Shee published another small volume of verses in 1814, entitled *The Commemoration of Sir Joshua Reynolds, and other Poems*, but this effort did not greatly increase his fame. He now produced a tragedy called *Alasco*, of which the scene was laid in Poland. The play was accepted at Covent Garden, and in the fertile fancy of the poet the play had already gained for him a great dramatic fame, when Colman, the licenser, refused it his sanction, on the plea of its containing certain treasonable allusions, and Shee, in great wrath, resolved to make his appeal to the public. This violent threat he carried out in 1824, but unfortunately the public found other business to mind, and *Alasco* is still on the list of unacted dramas. On the death of Lawrence in 1830, Shee was chosen president of the Royal Academy, and shortly afterwards he received the honor of knighthood. He was excellently qualified by his gentlemanly manners, business habits, and fluent speech for the position; and in the dispute regarding the use of rooms to be provided by Government, and in his examination before the parliamentary committee of 1836, he ably defended the rights of the Academy. He continued to paint till 1845, and died on the 13th of August, 1850, in his eightieth year.

The earlier portraits of the artist are carefully finished, easy in action, with good drawing and excellent discrimination of character. They show an undue tendency to redness in the flesh painting,—a defect which is still more apparent in his later works, in which the handling is less "square," crisp, and forcible.

SHEEP. The animals commonly designated by this name constitute the genus *Ovis* of zoologists, a group belonging to the Artiodactyle or paired-toe section of the *Ungulata* or hoofed mammals (see MAMMALIA, vol. xv., p. 435). They are ruminants and belong to the hollow-horned section, *i.e.*, those having persistent horns composed of conical epidermic sheaths, encasing and supported by processes of the frontal bone. This section includes the various species of Oxen, Goats and Antelopes, as well as the Sheep, animals all so closely related structurally that it is by no means easy to define the differences between them.

In nearly all wild sheep the horns are present in both sexes, though smaller in the female. They are trigonal in section, having always three more or less distinctly marked surfaces, divided by edges running longitudinally to the axis of the horn, sometimes sharply prominent, and sometimes rounded off. They are also marked by numerous transverse ridges and constrictions and present a strong more or less spiral curve, which varies in direction in different species. The teeth resemble generally those of the other *Bovidæ*. The upper incisors and canines are entirely wanting, their place being taken by a callous pad against which the lower front teeth bite. These are eight in number, all much alike and in close contact; the outer pair represent

[1] In Judges ix. 28 for עברו read יעבידו (Wellhausen after MSS. of LXX), and translate "Who is Abimelech or who are the Shechemites (his supporters) that we should be his slaves? By all means let the son of Jerubbaal and Zebul his officer enslave the men of Hamor father of Shechem; but why should we (Hebrews) be his slaves?" These words cannot have been spoken after the Shechemites had renounced Abimelech; vv. 29, 30 ought to stand immediately after ver. 22. See W. R. Smith, *Theol. Tijdschrift*, 1886, p. 195 *sq.*

[2] Eusebius gives the tree (terebinthus) of Gen. xxxv. 4 a place in his *Onomasticon*; and from it probably the bishop Terebinthius in Procop., *De Ædi.*, v. 7. had his name.

[3] The Canaanite sanctuary was represented as a mere temporary usurpation by the tradition (in the Elohistic narrative) that Jacob had bought the site of his altar from the Hamorites and bequeathed it to Joseph (Gen. xxxiii. 19, Josh. xxiv. 32; in the latter passage read with LXX. ויתנה for ויהיו).

the canines, the rest the incisors. On each side of the mouth above and below are six teeth close together, three of which are premolars (replacing milk teeth) and three true molars, all markedly selenodont (the grinding surfaces presenting crescent-like patterns) and hypsodont, or with long crowns and small roots. The dental formula is thus—incisors $\frac{0}{8}$, canines $\frac{0}{1}$, premolars $\frac{3}{3}$, molars $\frac{3}{3}$, $= \frac{6}{16}$; total of both sides 32. The vertebral formula is—cervical 7, dorsal 13, lumbar 6 or 7, sacral 4, caudal variable. In the feet the hoofs of the two middle toes (third and fourth) only reach the ground, and are equally developed. The outer toes (second and fifth) are very rudimentary, represented only by small hoofs, without bony phalanges, and by the proximal or upper ends of the slender splint-like metacarpal or metatarsal bones. Between the two middle toes, in most species, is lodged a deep sac, having the form of a retort and with a small external orifice, which secretes an unctuous and odorous substance. This, tainting the herbage or stones over which the animal walks, affords the means by which, through the powerfully developed sense of smell, the neighborhood of other individuals of the species is recognized. The crumen or suborbital gland, which is so largely developed and probably performs the same office in some antelopes

Moufflon (*Ovis musimon*). From a living animal in the London Zoological Gardens.

and deer, is present, but in a comparatively rudimentary form, though varying in different species. The tail, though long in many varieties of domestic sheep, is short in all the wild species, in which also the external covering of the body is in the main hairy,—the fine fleecy coats of wool, or hair so modified as to have the property of "felting" or adhering together under pressure, which give such value to many breeds, having been especially cultivated by selective breeding.

The sheep was a domestic animal in Asia and Europe before the dawn of history, though quite unknown as such in the New World until after the Spanish conquest. It has now been introduced by man into almost all parts of the world where settled agricultural operations are carried on, but flourishes especially in the temperate regions of both hemispheres. Whether our well-known and useful animal is derived from any one of the existing wild species, or from the crossing of several, or from some now extinct species, is quite a matter of conjecture. The variations of external characters seen in the different domestic breeds are very great. They are chiefly manifested in the form and number of the horns, which may be increased from the normal two to four or even eight, or may be altogether absent in the female alone or in both sexes; in the form and length of the ears, which often hang pendent by the side of the head; in the peculiar elevation or arching of the nasal bones in some Eastern races; in the length of the tail, and the development of the great masses of fat at each side of its root or in the tail itself; and in the color and quality of the fleece. See AGRICULTURE.

The distinction of the various permanent modifications under which wild sheep occur is a matter of considerable difficulty. Trivial characters, such as size, slight variations in color, and especially, the form and curvature of the horns, are relied upon by different zoologists who have given attention to the subject in the discrimination of species, but no complete accord has yet been established. The most generally recognized forms are enumerated below.

The geographical distribution of wild sheep is interesting. The immense mountain ranges of Central Asia, the Pamir and Thian Shan of Turkestan, may be looked upon as the centre of their habitat. Here, at an elevation of 16,000 feet above the sea-level, is the home of the magnificent *Ovis poli*, named after the celebrated Venetian traveller, Marco Polo, who met with it in his adventurous travels through this region in the 13th century. It is remarkable for the great size of the horns of the old rams and the wide open sweep of their curve, so that the points stand boldly out on each side, far away from the animal's head, instead of curling round nearly in the same plane, as in most of the allied species. A very similar if not identical species from the same origin, in which the horns retain their more normal development, has received the name of *O. karelini*. Eastward and northward is found the argali (*O. ammon*), with a wide and not very well determined range. Still further north, in the Stanovoi Mountains and Kamchatka, is *O. nivicola*, and away on the other side of Behring's Strait, in the Rocky Mountains and adjacent high lands of western North America, is the "bighorn" or mountain sheep (*O. montana*), the only one of the genus found in that continent and indeed—except the bison, the musk-ox (*Ovibos*), mountain goat (*Aploceras*), and the prongbuck (*Antilocapra*), —the only hollow-horned ruminant, being like the rest obviously a straggler from the cradle of its race. Turning southward from the point from which we started, and still a little to the east, in Nepal and Little Tibet, is *O. hodgsoni*, a species with large and strongly curved horns, and another with smaller and more spreading horns, the burrhel, *O. nahoor*. Passing in a southwesterly direction we find a series of smaller forms, *O. vignei*, of Ladak, *O. cycloceros* of northern India, Persia, and Baluchistan, *O. gmelini* of Asia Minor, *O. ophion*, confined to the elevated pine-clad Troödos Mountains of the island of Cyprus, and said at the time of the British occupation in 1878, to have been reduced to a flock of about twenty-five individuals, and *O. musimon*, the moufflon of Corsica and Sardinia (see figure), believed to have been formerly also a native of Spain. Lastly we have the somewhat aberrant, goat-like aoudad, *O. tragelaphus*, of the great mountain ranges of North Africa.

We thus find that sheep are essentially inhabitants of high mountainous parts of the world, for dwelling among which their wonderful powers of climbing and leaping give them special advantages. No species frequent by choice either level deserts, open plains, dense forests, or swamps. By far the greater number of species are inhabitants of the continent of Asia, one or perhaps two extending into North America, one into Southern Europe, and one into North Africa. No wild sheep occurs in any other part of the world, unless the so-called musk-ox (*Ovibos moschatus*) of the Arctic regions, the nearest existing ally to the true sheep, may be considered as one. Geologically speaking, sheep appear to be very modern animals, or perhaps it would be safer to say that no remains that can be with certainty referred to the genus have been met with in the hitherto explored true Tertiary beds, which have yielded such abundant modifications of antelopes and deer. They are apparently not indigenous in the British Isles, but were probably introduced by man from the East in prehistoric times. (W. H. F.)

SHEEPSHEAD is the name of one of the largest species of the genus *Sargus*, marine fishes known on the coasts of southern Europe as "Sargo" or "saragu." These fishes possess two kinds of teeth:—one, broad and flat, like incisors, occupying in a single series the front of the jaws; the other, semiglobular and molar-

like, arranged in several series on the sides of the jaws. For the systematic position of the genus, see vol. xii. p. 727. The sheepshead, *Sargus ovis*, occurs in abundance on the Atlantic coasts of the United States, from Cape Cod to Florida, and is one of the most valued

Sheepshead.

food-fishes of North America. It is said to attain to a length of 30 inches and a weight of 15 pounds. Its food consists of shellfish, which it detaches with its incisors from the base to which they are fixed, crushing them with its powerful molars. It may be distinguished from some other allied species occurring in the same seas by the presence of seven or eight dark cross-bands traversing the body, by a recumbent spine in front of the dorsal fin, by twelve spines and as many rays of the dorsal and ten rays of the anal fin, and by forty-six scales along the lateral line. The term "sheepshead" is also given in some parts of North America to a very different fish, a freshwater Sciænoid, *Corvina oscula*, which is much less esteemed for the table.

SHEERNESS-ON-SEA, a seaport, watering-place, naval establishment, and garrison town in the Isle of Sheppey, Kent, is situated on the Thames at the mouth of the Medway, on the Sittingbourne branch of the London, Chatham, and Dover Railway, 52 miles east of London, and 17 northeast of Maidstone. The older part of Sheerness, containing the dockyard, is called Blue Town, the later additions being known as Miletown, Bankstown, and Marinetown. Marinetown consists chiefly of houses occupied by summer visitors, but although there is a good beach for bathing the presence of the dockyard with its surroundings has militated against the success of the town as a watering-place. The dockyard, erected by the admiralty about 1830, was seriously damaged by fire in 1881. The naval establishment is only of the second-class, the basins being too small to admit vessels of the largest size. The dockyard is 60 acres in extent, and contains naval barracks with accommodation for 1000 men. A fort was built at Sheerness by Charles II., which on the 10th July, 1667, was taken by the Dutch fleet under De Ruyter. After this mishap it was strengthened and a dockyard was formed. The fortifications are now of great strength, £100,000 [$486,000] having been spent in adapting them to modern necessities. The town is in the parish of Minster, which possesses the most ancient abbey church in England. The population of the urban sanitary district (area 938 acres) in 1871 was 13,956, and in 1881 it was 14,286.

SHEFFIELD, a municipal and parliamentary borough in the West Riding of Yorkshire, next to Leeds the largest town in the county, and the chief seat of the cutlery trade in England, is situated on somewhat hilly ground in the neighborhood of the Pennine range, on several rivers and streams, the principal of which are the Don, the Sheaf, the Porter, the Rivelin, and the Loxley, and on the Midland, Great Northern, and various branch railway lines, 39 miles south of Leeds, 37 southeast of Manchester, 172 north of London by the Midland Railway, and 162 by the Great Northern. The borough of Sheffield is coëxtensive with the parish, and embraces a district 10 miles in length by 3 or 4 miles in breadth. It includes the townships of Sheffield, Brightside Bierlow, Attercliffe-cum-Darnall, Nether Hallam, Heeley, Ecclesall Bierlow, and Upper Hallam, the last two districts being in great part rural, but occupied also by the southern and western suburbs of the borough. The older portions of the town are somewhat irregularly built, and in some districts densely populated, but much has been done of late years to widen and otherwise improve the streets in the central districts by the operation of an Act passed in 1875, the expense amounting in all to about £1,000,000 [$4,860,000]. The suburbs contain a large number of beautiful terraces and mansions, picturesquely situated in the neighborhood of fine natural scenery. A considerable portion of them is occupied by workmen's cottages, many of which are surrounded by well-kept gardens.

Sheffield in 1845 was divided into twenty-five parochial districts, which have been gradually added to in successive years, and in 1855 it was constituted a deanery. The only ecclesiastical building of special interest is the old parish church of St. Peter, chiefly in the Perpendicular style, originally cruciform, but by various additions now rectangular. The old Norman building is supposed to have been burned down during the wars of Edward III. with the barons, and the most ancient part of the present structure is the tower, dating from the 14th century. The church has lately been restored at the cost of about £20,000 [$97,200]. It contains a large number of interesting mural monuments.

The free grammar school was founded in 1603 through a bequest of Thomas Smith, a native of Sheffield, practicing as an attorney at Crowland, Lincolnshire, and it received the sanction of King James I. in 1604, with the title "The Free Grammar School of King James of England." The grammar school building of stone in the Tudor style, erected in 1824, is now (1886) used as a technical school, the grammar school trustees having purchased the collegiate school at Broomhall Park. The other principal educational institutions are the free writing school (1715, rebuilt in 1827), the boys' charity school (founded 1706), the girls' charity school (1786), the Roman Catholic reformatory (1861), the Church of England educational institute, the Firth College, erected by Mark Firth at a cost of £20,000 [$97,200]; for lectures and classes in connection with the extension of university education, the Wesley College, associated with London University, Ranmoor College, for training young men for the ministry in the Methodist New Connection, the mechanics' institute, the school of art, and the St. George's Museum, founded by Mr. Ruskin, and including a picture gallery, a library, and a mineral, a natural history, and a botanical collection, the special purpose of the institution being the training of art students. The school board was first elected in 1870, and carries on its operations with great energy and success.

The principal public buildings are the town-hall, including the police offices and rooms for the quarter sessions and other courts, erected in 1808, enlarged in 1833, and lately extensively remodelled at a cost of over £10,000 [$48,600]; the council hall and municipal buildings, originally used for the mechanics' institute, but purchased by the corporation in 1864; the cutlers' hall, built in 1832 at a cost of £6500 [$31,590], and enlarged in 1857 by the addition of a magnificent ban-

queting hall, erected at a cost of £9000 [$43,740]; the general post office, in the Doric style, opened in 1874; the fine new corn exchange, in the Tudor style, erected at a cost of £60,000 [$291,600]; the Albert Hall, opened in 1873 by a joint-stock company for concerts and public meetings; the music hall, erected in 1823; the freemasons' hall, opened in 1877; the temperance halls, 1856; the Norfolk market hall, opened in 1857 at a cost of £40,000 [$194,400]; the theatre royal, originally erected in 1793, rebuilt in 1880 at a cost of £8000 [$38,880]; the Alexandra theatre, erected 1836–7 at a cost of £8000 [$38,880]; the barracks, having accommodation for a cavalry and an infantry regiment and surrounded by grounds 25 acres in extent; and the volunteer artillery drill hall, erected at a cost of £9000 [$43,740]. The literary and social institutions include the Athenæum, established in 1847, with

Plan of Sheffield.

a newsroom and library; the literary and philosophical society, 1822; the Sheffield club, 1862; the Sheffield library, commenced in 1777, and containing 80,000 volumes; and the free library, founded in 1856, with various branches opened in subsequent years. Among the medical or benevolent institutions may be mentioned the general infirmary, opened in 1797, and successively enlarged and improved as requirements demanded; the public hospital, erected in 1858 (in connection with the Sheffield medical school established in 1792) and extended in 1869; the hospital for women, originally established in 1864, but transferred in 1878 to a new building erected at the expense of Thomas Jessop, and now called the Jessop hospital for women; the hospital for diseases of the skin, 1880; the ear and throat hospital, 1880; the fever hospital, erected by the Town Council at a cost of about £25,000 [$121,500]; the school and manufactory for the blind, 1879; the South Yorkshire lunatic asylum, 1872; the Shrewsbury hospital for twenty men and twenty women, originally founded by the seventh earl of Shrewsbury, who died in 1616, but since greatly enlarged by successive benefactions; the Hollis hospital, established in 1700 for widows of cutlers, etc.; the Firth almshouses, erected and endowed in 1869 by Mark Firth of Oakbrook at a cost of £30,000 [$145,800]; the licensed victuallers' asylum, 1878; the Deakin institution, 1849; Hanby's charity, 1766; and Hadfield's charity, 1860.

The public monuments are neither numerous nor important, the principal being the Montgomery statue, erected to James Montgomery the poet in 1861, chiefly by the Sunday school teachers of the town, the Ebenezer Elliot monument, erected in the market-place in 1854, and removed to Weston Park in 1875, the column to Godfrey Sykes the artist, erected in Weston Park in 1871, the cholera monument 1834–5, and the Crimean monument to the natives of Sheffield who died in the Crimean War.

The town is comparatively well supplied with parks and public gardens. In three of the more populous districts the duke of Norfolk, lord of the manor, presented plots of ground amounting in all to 26 acres, to be used as recreation grounds. In the western suburbs is the Weston Park and Museum, occupying the grounds and mansion house of Weston Hall, which the town council purchased in 1873. The grounds are about 13 acres in extent, and the museum includes—in addition to the Mappin Art Gallery, now (1886) being erected from the bequest of John Newton Mappin—a picture gallery, a natural history collection, and an extensive

collection of British antiquities. The Firth Park, on the northeast of the town, 36 acres in extent, was purchased by Mark Firth, and presented to the town, the opening ceremony by the prince and princess of Wales taking place 16th August, 1875. The Norfolk Park, 60 acres in extent, is granted by the duke of Norfolk for the use of the town, but remains his property. The botanical gardens, 18 acres in extent, situated in the western suburbs, are the property of a company, but on certain days they are open to the public at a small charge. The Bramall Lane cricket ground is the scene of most of the Yorkshire county cricket matches.

The prosperity of Sheffield is chiefly dependent on the manufacture of steel and the application of it to its various uses. The smelting of iron in the district is supposed to date from Roman times, and there is distinct proof carrying it back as far as the Norman Conquest. The town had become famed for its cutlery by the 14th century, as is shown by allusions in Chaucer. There was an important trade carried on in knives in the reign of Elizabeth, and the Cutlers' Company was incorporated in 1624. In early times cutlery was made of blister or bar steel; afterwards shear steel was introduced for the same purpose; but in 1740 Benjamin Huntsman of Handsworth introduced the manufacture of cast steel, and up to the present time Sheffield retains its supremacy in steel manufacture, notwithstanding foreign competition, especially that of Germany and the United States, its trade in heavy steel having kept pace with that in the other branches. It was with the aid of Sheffield capital that Henry Bessemer founded his pioneer works to develop the manufacture of his invention, and a large quantity of Bessemer steel is still made in Sheffield. The heavy branch of the steel manufacture includes armor plates, rails, tires, axles, large castings for engines, steel shot, and steel for rifles. The cutlery trade embraces almost every variety of instrument and tool,—spring and table knives, razors, scissors, surgical instruments, mathematical instruments, edge tools, saws, scythes, sickles, spades, shovels, engineering tools, hammers, vices, etc. The manufacture of engines and machinery is also largely carried on, as well as that of stoves and grates. The art of silver plating was introduced by Thomas Bolsover in 1742, and the manufacture is still of importance. Among the minor industries of the town are tanning, confectionery, cabinetmaking, bicycle making, iron and brass founding, silver refining, and the manufacture of brushes and combs and of optical instruments. On account of various outrages perpetrated by artisans in workshops against persons obnoxious to them, a Government commission was in 1867 appointed to make inquiries, the result being the exposure and suppression of confederacies in connection with various workmen's unions.

The town trust for the administration of property belonging to the town dates from the 14th century, and in 1681 the number and manner of election of the "town trustees" was definitely settled by a decree of the Court of Chancery. Additional powers were conferred on the trustees by an Act passed in 1874. The annual income of the trust property now amounts to about £5000. Sheffield obtained municipal government in 1843, and is divided into nine wards. The number of aldermen is sixteen. Since 1864 the town council have had control of the police, of the maintenance of the streets, and of the drainage and sanitary arrangements, but the supplies of water and gas are in the hands of private companies. The markets belong to the duke of Norfolk, lord of the manor. The town first returned members to parliament in 1832. In 1885 the representation was increased from two to five members, the parliamentary divisions being Attercliffe, Brightside, Central, Ecclesall, and Hallam. The area of the municipal and parliamentary borough is 19,651 acres. From 45,755 in 1801 the population had increased by 1841 to 110,891, by 1871 to 239,947, and by 1881 to 284,508 (141,298 males, 143,210 females).

Sheffield was the capital of Hallamshire from the Norman Conquest, and it is supposed that the "aula" of the Saxon Lord Waltheof mentioned in Domesday was on the Castle Hill. After the execution of Waltheof for a conspiracy against the Conqueror in 1075 the manor for some time remained in the hands of his countess, but in 1080 was possessed by Roger de Busli. Afterwards it passed to the De Lovetots, barons of Huntingdonshire, one of whom had a castle at Sheffield. A number of people, workers in iron, gathered round the castle and formed the nucleus of the town. Through an heiress of the De Lovetots it passed in the reign of Richard I. to the De Furnivals, one of whom, Thomas de Furnival, strengthened and completed the castle, and obtained from Edward I. a charter under the great seal for a market and annual fair. After the extinction of the male line of the Furnivals in 1406, the manor passed to the Talbots, of whom John, referred to in Shakespeare's *Henry VI.*, was created earl of Shrewsbury in 1442. Cardinal Wolsey, during his disgrace, was for some time placed in Sheffield Castle, under the charge of George, fourth earl of Shrewsbury; and Queen Mary remained a prisoner in it under the care of George, sixth earl, from the autumn of 1570 to the autumn of 1584. During the Civil Wars the castle was seized in 1642 by the Parliamentary party, who garrisoned it and threw up entrenchments round the town, but after the capture of Rotherham in April, 1643, they, on the approach of the earl of Newcastle, left it in panic and fled to Derbyshire. It was, however, recaptured by the party in the following year, and was subsequently demolished. In 1654 the estate passed by marriage to the Howards, dukes of Norfolk.

See Hunter's *Hallamshire*, 1819, new ed. by A. SHEFFIELD, JOHN. See BUCKINGHAMSHIRE, DUKE OF.

SHEIL, RICHARD LALOR (1791–1851), Irish political orator, was the eldest son of Edward Sheil, an Irishman who had acquired considerable wealth in Spain, and after the passing of the Act permitting Catholics in Ireland to purchase and transmit property in fee had returned to Ireland, where he purchased the estate of Bellevue, Tipperary. The son was born 17th August, 1791, at Drumdowney, Tipperary. He received instruction in French and Latin from the Abbé de Grimeau, a French refugee, and afterwards at Kensington House school, London, presided over by a French nobleman, the Prince de Broglie. In October, 1804, he was removed to the college at Stoneyhurst, Lancashire, and in November, 1807, entered Trinity College, Dublin, where he specially distinguished himself in the debates of the Historical Society. He graduated B.A. in July, 1811, and on 13th November of the same year entered Lincoln's Inn, preparatory to being called to the Irish bar. He was admitted a member of the Irish bar at the Hilary term 1814, and meanwhile resolved to support himself by writing plays. His play of *Adelaide, or the Emigrants*, was played at the Crow Street theatre, Dublin, 19th February, 1814, with complete success, and on the 23d May, 1816, was performed at Covent Garden. The *Apostate*, produced at the latter theatre on 3d May, 1817, firmly established his reputation, and encouraged him to continue his dramatic efforts till his legal and political duties absorbed the greater part of his leisure. His principal other plays are *Bellamira* (written in 1818), *Evadne* (1819), *Huguenot* (1819), and *Montini* (1820). In 1822 he began, along with W. H. Curran, to contribute to the *New Monthly Magazine* a series of papers entitled *Sketches of the Irish Bar*, which attracted considerable attention by their raciness and graphic vigor. Those written by Sheil were published in 1855 in two volumes, with a sketch of his life. Sheil was one of the principal founders of the Catholic Association in 1823, and drew up the petition for inquiry into the mode of administering the laws in Ireland, which was presented in the same year to both Houses of Parliament. After the defeat of the Catholic Relief Bill in 1825 he suggested the formation of the New Catholic Association, and, along with O'Connell, was the principal leader of the agitation persistently carried on till Catholic emancipation was granted in 1829. In the same year he was returned to parliament for Melbourne Port, and in 1831 for Louth. He took a prominent part in all the debates relating to Ireland, and his brilliant eloquence gradually captivated the admiration of the House. In August, 1839, he became vice-president of the board of trade in Lord Melbourne's ministry. After the accession of Lord John Russell to power in 1846 he was appointed master of the mint. Being desirous, on account of his wife's health, to obtain diplomatic employment abroad, he

was in 1850 appointed minister at the court of Tuscany. He died somewhat suddenly of gout at Florence on May 23, 1851.

See *Memoirs of Richard Lalor Sheil*, by W. Torrens M'Cullagh (2 vols. 1855).

SHEKEL. In the system of Babylonian and Assyrian weights the talent (called in Heb. כִּכָּר, kikkar) consisted of 60 mana (Heb. מָנֶה, maneh), or minas, and the latter again of sixty shekels (Heb. שֶׁקֶל). For the values of these weights see NUMISMATICS, vol. xvii. p. 646, where it is also explained that the Phœnicians and Hebrews modified the system and reckoned only 50 shekels to the maneh, at all events in applying the names to money, *i.e.*, to the precious metals,[1] and that the weight of their silver shekel was also probably modified for convenience of interchange between the gold and silver standard. The silver shekels of the Maccabees (NUMISMATICS, p. 668) have a maximum weight of about 224 grains, and correspond to the Phœnician tetradrachm (four drams). Hence in Matt. xvii. 24 the temple tax of half a shekel is called the didrachm (2 drams). In 2 Sam. xiv. 26 we read of shekels "after the king's weight," *i.e.*, according to the Assyrian standard, which is called "royal" on weights found at Nineveh. The Hebrews divided the shekel into twenty parts, each of which was a gerah (גֵּרָה).

SHELBURNE, EARL OF. See LANSDOWNE, MARQUIS of.

SHELD-DRAKE, or, as commonly spelled in its contracted form, SHELDRAKE, a word whose derivation[2] has been much discussed, one of the most conspicuous birds of the Duck tribe, *Anatidæ*, called, however, in many parts of England the "Burrow-Duck" from its habits presently to be mentioned, and in some districts by the almost obsolete name of "Bergander" (Dutch, *Berg-eende*, Germ. *Berg-ente*), a word used by Turner in 1544.

The Sheldrake is the *Anas tadorna*[3] of Linnæus, and the *Tadorna cornuta* or *T. vulpanser* of modern ornithology, a bird somewhat larger and of more upright stature than an ordinary Duck, having its bill, with a basal fleshy protuberance (whence the specific term *cornuta*), pale red, the head and upper neck very dark glossy green, and beneath that a broad white collar, succeeded by a still broader belt of bright bay extending from the upper back across the upper breast. The outer scapulars, the primaries, a median abdominal stripe, which dilates at the vent, and a bar at the tip of the middle tail-quills are black; the inner secondaries and the lower tail-coverts are gray; and the *speculum* or wing-spot is a rich bronzed-green. The rest of the plumage is pure white, and the legs are flesh-colored. There is little external difference between the sexes, the female being only somewhat smaller and less brightly colored. The Sheldrake frequents the sandy coasts of nearly the whole of Europe and North Africa, extending across Asia to India, China and Japan, generally keeping in pairs and sometimes penetrating to favorable inland localities. The nest is always made under cover, usually in a rabbit-hole among sand hills, and in the Frisian Islands the people supply this bird with artificial burrows, taking large toll of it in eggs and down. Barbary, southeastern Europe, and Central Asia are inhabited by an allied species of more inland range and very different coloration, the *T. casarca* or *Casarca*[4] *rutila* of ornithologists, the Ruddy Sheldrake of English authors—for it has several times strayed to the British Islands,—and the "Brahminy Duck" of Anglo-Indians, who find it resorting in winter, whether by pairs or by thousands, to their inland waters. This species is of an almost uniform bay color all over, except the quill-feathers of the wings and tail, and (in the male) a ring round the neck, which are black, while the wing-coverts are white and the *speculum* shines with green and purple; the bill and legs are dark-colored.[5] A species closely resembling the last, but with a gray head, *T. cana*, inhabits South Africa, while in some of the islands of the Malay Archipelago, and in the northern parts of Australia, there is a fourth species, *T. radjah*, which almost equals the true Sheldrake in its brightly contrasted plumage, but yet wants some of the lively colors the latter displays—its head, for instance, being white instead of dark green. Further to the southward in Australia occurs another species of more sombre colors, the *T. tadornoides;* and New Zealand is the home of a sixth species, *T. variegata*, still less distinguished by bright hues. In the last two the plumage of the sexes differs not inconsiderably, but all are believed to have essentially the same habits as the *T. cornuta*.[6]

It is not without a purpose that these different species are here particularized. Sheldrakes will, if attention be paid to their wants, breed freely in captivity, crossing if opportunity be given them with other species, and an incident therewith connected possesses an importance hardly to be overrated by the philosophical naturalist, though it seems not to have met with the attention it deserves. In the Zoological Society's gardens in the spring of 1859 a male of *T. cornuta* mated with a female of *T. cana*, and, as will have been inferred from what has been before stated, these two species differ greatly in the coloring of their plumage. The young of their union, however, presented an appearance wholly unlike that of either parent, and an appearance which can hardly be said, as has been said (*P. Z. S.*, 1859, p. 442), to be "a curious combination of the colors of the two." Both sexes of this hybrid have been admirably portrayed by Mr. Wolf (*tom. cit.*, Aves, pl. 158); and, strange to say, when these figures are compared with equally faithful portraits by the same master (*op. cit.*, 1864, pls. 18, 19) of the Australian and New Zealand species, *T. tadornoides* and *T. variegata*, it will at once be seen that the hybrids present an appearance almost midway between the two species last named—species which certainly had nothing to do with their production. The only explanation of this astounding fact seems to be that afforded by the principle of "reversion," as set forth by Mr. Darwin, and illustrated by him from examples of certain breeds of Doves, domestic Fowls, and Ducks (*Anim. and Pl. under Domestication*, i. pp. 197–200, ii. p. 40), as well as, in the matter of domestic Fowls, by Mr. Cambridge Phillips (*Zoologist*, 1884, p. 331). It is a perfectly fair hypothesis that the existing animals of New Zealand and Australia retain more of their ancestral character than do those of countries in which we may suppose the struggle for life to have been fiercer and the action of natural selection stronger. Why it is so we cannot say, yet experiment proves that the most widely different breeds of Pigeons and other poultry, when crossed, produce offspring that more resembles the ancestral wild species from which the domesticated forms have sprung than it resembles either of the immediate parents. This mysterious agency is known as the principle of "reversion," and the example just cited proves that the same effect is produced in species as well as in "races,"—indicating the essential identity of both,—the only real difference being that "species" are more differentiated than are "races," or that the distinction between them, instead of being

[1] See Exod. xxxviii. 25, where there are 3000 shekels in the talent.

[2] Ray in 1674 (*Engl. Words*, p. 76) gave it from the local "sheld" (=particolored), which, applied to animals, as a horse or cat, still survives in East Anglia. This opinion is not only suitable but is confirmed by the bird's Old Norsk name *Skjöldungr*, from *Skjöldr*, primarily a patch, and now commonly bestowed on a piebald horse, just as *Skjalda* (Cleasby's *Icel. Dict., sub voce*), from the same source, is a particolored cow. But some scholars interpret *Skjöldungr* by the secondary meaning of *Skjöldr*, a shield, asserting that it refers to "the shield-like band across the breast" of the bird. If they be right the proper spelling of the English word would be "Shield-drake," as some indeed have it. A third suggested meaning, from the Old Norsk *Skjól*, shelter, is philologically to be rejected, but, if true, would refer to the bird's habit, described in the text, of breeding under cover.

[3] This is the Latinfzed form of the French *Tadorne*, first published by Belon (1555), a word on which Littré throws no light except to state that it has a southern variant *Turdome*.

[4] Bonaparte was pleased in 1838 to separate this species from the genus *Tadorna*, but neither he nor any of his successors has shown any good reason for doing so.

[5] Jerdon (*B. India*, iii. p. 793) tells of a Hindu belief that once upon a time two lovers were transformed into birds of this species, and that they or their descendants are condemned to pass the night on the opposite banks of a river, whence they unceasingly call to one another: "Charkwa, shall I come?" "No, Charkwi." "Charkwi, shall I come?" "No, Charkwa." As to how, under these circumstances, the race is perpetuated the legend is silent.

[6] The *Anas scutellata* of the Indo-Malay countries is by several authorities considered to be a *Tadorna*, but this view is denied by others, among them by Mr. Hume (*Stray Feathers*, viii. p. 158).

(as many writers, some of the first repute, have maintained) qualitative, is merely quantitative, or one of degree.[1]

The genus *Tadorna*, as shown by its tracheal characters, seems to be most nearly related to *Chenalopex*, containing the bird so well known as the Egyptian Goose, *C. ægyptiaca*, and an allied species, *C. jubata*, from South America. For the same reason the genus *Plectropterus*, composed of the Spur-winged Geese of Africa, and perhaps the Australian *Anseranas* and the Indian and Ethiopian *Sarcidiornis*, also appear to belong to the same group, which should be reckoned rather to the Anatine than to the Anserine section of the *Anatidæ*. (A. N.)

SHELLEY, Mary Wollstonecraft (1797–1851), the second wife of the poet Shelley (*q.v.*), born in London, August 30, 1797 (see vol. x. p. 639), deserves some notice on her own account, as a writer of romance, chiefly imaginative. When she was in Switzerland with Shelley and Byron in 1816 (see below), a proposal was made that various members of the party should write a romance or tale dealing with the supernatural. The result of this project was that Mrs. Shelley wrote *Frankenstein*, Byron the beginning of a narrative about a vampyre, and Dr. Polidori, Byron's physician, a tale named *The Vampyre*, the authorship of which used frequently in past years to be attributed to Byron himself. *Frankenstein*, published in 1818, when Mrs. Shelley was at the utmost twenty-one years old, is a very remarkable performance for so young and inexperienced a writer; its main idea is that of the formation and vitalization, by a deep student of the secrets of nature, of an adult man, who, entering the world thus under unnatural conditions, becomes the terror of his species, a half-involuntary criminal, and finally an outcast whose sole resource is self-immolation. This romance was followed by others: *Valperga, or the Life and Adventures of Castruccio, Prince of Lucca* (1823), an historical tale written with a good deal of spirit, and readable enough even now; *The Last Man* (1826), a fiction of the final agonies of human society owing to the universal spread of a pestilence,—this is written in a very stilted style, but bears some traces of the imagination which fashioned *Frankenstein*; *The Fortunes of Perkin Warbeck* (1830); *Lodore* (1835); and *Falkner* (1837). Besides these novels there was the *Journal of a Six Weeks' Tour* (the tour of 1814 mentioned below), which is published in conjunction with Shelley's prose-writings; also *Rambles in Germany and Italy* in 1840–42–43 (which shows an observant spirit, capable of making some true forecasts of the future), and various miscellaneous writings. After the death of Shelley, for whom she had a deep and even enthusiastic affection, marred at times by defects of temper, Mrs. Shelley in the autumn of 1823 returned to London. At first the earnings of her pen were her only sustenance; but after a while Sir Timothy Shelley made her an allowance, which would have been withdrawn if she had persisted in a project of writing a full biography of her husband. She was a loving and careful mother, and shared the prosperous fortunes of her son, when, upon the death of Sir Timothy in 1844, he succeeded to the baronetcy. She died in February, 1851.

SHELLEY, Percy Bysshe (1792–1822), was born on 4th August, 1792, at Field Place, near Horsham, Sussex. He was the eldest child of Timothy Shelley, M.P. for Shoreham, by his wife Elizabeth, daughter of Charles Pilfold, of Effingham, Surrey. Mr. Timothy Shelley became in 1815 Sir Timothy Shelley, Bart., upon the decease of his father Bysshe, who was created a baronet in 1806. This Bysshe Shelley was born in Christ Church, Newark, North America, and married two heiresses, the former, the mother of Timothy, being Mary Catherine, heiress of the Rev. Theobald Michell, of Horsham. He was a handsome man of enterprising and remarkable character, accumulated a vast fortune, built Castle Goring, and lived in sullen and penurious retirement in his closing years. None of his talent seems to have descended to Timothy, who, except for being of a rather oddly self-assertive character, was undistinguishable from the ordinary run of commonplace country squires. The mother of the poet is described as beautiful, and a woman of good abilities, but not with any literary turn; she was an agreeable letter-writer. The branch of the Shelley family to which the poet Percy Bysshe belonged traces its pedigree to Henry Shelley, of Worminghurst, Sussex, who died in 1623. Beyond that point the genealogical record is not clear; yet no substantial doubt exists that these Worminghurst or Castle Goring Shelleys are of the same stock as the Michelgrove Shelleys, who trace up to Sir William Shelley, judge of the common pleas under Henry VII., thence to a member of parliament in 1415, and to the reign of Edward I., or even to the epoch of the Norman Conquest. The Worminghurst branch was a family of credit, but not of distinction, until its fortunes culminated under the above-named Sir Bysshe.

In the character of Percy Bysshe Shelley three qualities become early manifest, and may be regarded as innate: impressionableness or extreme susceptibility to external and internal impulses of feeling; a lively imagination or erratic fancy, blurring a sound estimate of solid facts; and a resolute repudiation of outer authority or the despotism of custom. These qualities were highly developed in his earliest manhood, were active in his boyhood, and no doubt made some show even on the borderland between childhood and infancy. At the age of six he was sent to a day school at Warnham, kept by the Rev. Mr. Edwards; at ten to Sion House School, Brentford, of which the principal was Dr. Greenlaw, while the pupils were mostly sons of local tradesmen; at twelve (or immediately before that age, 29th July, 1804) to Eton. The headmaster of Eton, up to nearly the close of Shelley's sojourn in the school, was Dr. Goodall, a mild disciplinarian; it is therefore a mistake to suppose that Percy (unless during his very brief stay in the lower school) was frequently flagellated by the formidable Dr. Keate, who only became headmaster after Goodall. Shelley was a shy, sensitive, mopish sort of boy from one point of view,—from another a very unruly one, having his own notions of justice, independence, and mental freedom; by nature gentle, kindly, and retiring,—under provocation dangerously violent. He resisted the odious fagging system, exerted himself little in the routine of school-learning, and was known both as "Mad Shelley" and as "Shelley the Atheist." Some writers try to show that an Eton boy would be termed atheist without exhibiting any propensity to atheism, but solely on the ground of his being mutinous. However, as Shelley was a declared atheist a good while before attaining his majority, a shrewd suspicion arises that, if Etonians dubbed him atheist, they had some relevant reason for doing so.

Shelley entered University College, Oxford, in April, 1810, returned thence to Eton, and finally quitted the school at midsummer, and commenced residence in Oxford in October. Here he met a young Durham man, Thomas Jefferson Hogg, who had preceded him in the university by a couple of months; the two youths at once struck up a warm and intimate friendship. Shelley had at this time a love for chemical experiment, as well as for poetry, philosophy, and classical study, and was in all his tastes and bearing an enthusiast. Hogg was not in the least an enthusiast, rather a cynic, but he also was a steady and well-read classical student. In religious matters both were skeptics, or indeed decided anti-Christians; whether Hogg, as the senior and more informed disputant, pioneered Shelley into strict atheism, or whether Shelley,

[1] It is further worthy of remark that the young of *T. variegata* when first hatched closely resemble those of *T. casarca*, and when the former assume their first plumage they resemble their father more than their mother (*P. Z. S.*, 1866, p. 150).

as the more impassioned and unflinching speculator, outran the easy-going jeering Hogg, is a moot point; we incline to the latter opinion. Certain it is that each egged on the other by perpetual disquisition on abstruse subjects, conducted partly for the sake of truth and partly for that of mental excitation, without on either side any disposition to bow to authority or stop short of extreme conclusions. The upshot of this habit was that Shelley and Hogg, at the close of some five months of happy and uneventful academic life, got expelled from the university. Shelley—for he alone figures as the writer of the "little syllabus," although there can be no doubt that Hogg was his confidant and coadjutor throughout—published anonymously a pamphlet or flysheet entitled *The Necessity of Atheism*, which he sent round, or intended to send round, to all sorts of people as an invitation or challenge to discussion. It amounted to saying that neither reason nor testimony is adequate to establish the existence of a deity, and that nothing short of a personal individual self-revelation of the deity would be sufficient. The college authorities heard of the pamphlet, somehow identified Shelley as its author, and summoned him before them—"our master, and two or three of the fellows." The pamphlet was produced, and Shelley was required to say whether he had written it or not. The youth declined to answer the question, and was expelled by a written sentence, ready drawn up. Hogg was next summoned, with a result practically the same. The precise details of this transaction have been much controverted; the best evidence is that which appears on the college records, showing that both Hogg and Shelley (Hogg is there named first) were expelled for "contumaciously refusing to answer questions," and for "repeatedly declining to disavow" the authorship. Thus they were dismissed as being mutineers against academic authority, in a case pregnant with the suspicion—not the proof—of atheism; but how the authorities could know beforehand that the two undergraduates would be contumacious and stiff against disavowal, so as to give warrant for written sentences ready drawn up, is nowhere explained. Possibly the sentences were worded without ground assigned, and would only have been produced *in terrorem* had the young men proved more malleable. The date of this incident was 25th March, 1811.

Shelley and Hogg came up to London, where Shelley was soon left alone, as his friend went to York to study conveyancing. Percy and his incensed father did not at once come to terms, and for a while he had no resource beyond pocket-money saved up by his sisters (four in number altogether) and sent round to him, sometimes by the hand of a singularly pretty school-fellow, Miss Harriet Westbrook, daughter of a retired and moderately opulent hotel-keeper. Shelley, especially in early youth, had a somewhat "priggish" turn for moralizing and argumentation, and a decided mania for proselytizing; his school-girl sisters, and their little Methodist friend Miss Westbrook, aged between fifteen and sixteen, must all be enlightened and converted to anti-Christianity. He, therefore, cultivated the society of Harriet, calling at the house of her father, and being encouraged in his assiduity by her much older sister Eliza. Harriet not unnaturally fell in love with him; and he, though not it would seem at any time ardently in love with her, dallied along the flowery pathway which leads to sentiment and a definite courtship. This was not his first love-affair; for he had but a very few months before been courting his cousin Miss Harriet Grove, who, alarmed at his heterodoxies, finally broke off with him—to his no small grief and perturbation at the time. It is averred, and seemingly with truth, that Shelley never indulged in any sensual or dissipated amour; and, as he advances in life, it becomes apparent, that though capable of the passion of love, and unusually prone to regard with much effusion of sentiment women who interested his mind and heart, the mere attraction of a pretty face or an alluring figure left him unenthralled. After a while Percy was reconciled to his father, revisited his family in Sussex, and then stayed with a cousin in Wales. Hence he was recalled to London by Miss Harriet Westbrook, who wrote complaining of her father's resolve to send her back to her school, in which she was now regarded with repulsion as having become too apt a pupil of the atheist Shelley. He replied counselling resistance. "She wrote to say" (these are the words of Shelley in a letter to Hogg, dating towards the end of July, 1811) "that resistance was useless, but that she would fly with me, and threw herself upon my protection." Shelley, therefore, returned to London, where he found Harriet agitated and wavering; finally they agreed to elope, travelled in haste to Edinburgh, and there, according to the law of Scotland, became husband and wife on 28th August. Shelley, it should be understood, had by this time openly broken, not only with the dogmas and conventions of Christian religion, but with many of the institutions of Christian polity, and in especial with such as enforce and regulate marriage; he held—with William Godwin and some other theorists—that marriage ought to be simply a voluntary relation between a man and a woman, to be assumed at joint option and terminated at the after-option of either party. If, therefore, he had acted upon his personal conviction of the right, he would never have wedded Harriet, whether by Scotch, English, or any other law; but he waived his own theory in favor of the consideration that in such an experiment the woman's stake, and the disadvantages accruing to her, are out of all comparison with the man's. His conduct, therefore, was so far entirely honorable; and, if it derogated from a principle of his own (a principle which, however contrary to the morality of other people, was and always remained matter of genuine conviction on his individual part), this was only in deference to a higher and more imperious standard of right.

Harriet Shelley was not only beautiful; she was amiable, accommodating, adequately well educated and well bred. She liked reading, and her reading was not strictly frivolous. But she could not (as Shelley said at a later date) "feel poetry and understand philosophy." Her attractions were all on the surface; there was (to use a common phrase) "nothing particular in her." For nearly three years Shelley and she led a shifting sort of life upon an income of £400 [$1944] a year, one-half of which was allowed (after his first severe indignation at the *mésalliance* was past) by Mr. Timothy Shelley, and the other half by Mr. Westbrook. The spouses left Edinburgh for York and the society of Hogg; broke with him upon a charge made by Harriet, and evidently fully believed by Shelley at the time, that, during a temporary absence of his upon business in Sussex, Hogg had tried to seduce her (this quarrel was entirely made up at the end of about a year); moved off to Keswick in Cumberland, coupled with the company of Southey, and some hospitality from the duke of Norfolk, who, as chief magnate in the Shoreham region of Sussex, was at pains to reconcile the father and his too unfilial heir; sailed thence to Dublin, where Shelley was eager, and in some degree prominent, in the good cause of Catholic emancipation, conjoined with repeal of the union: crossed to Wales, and lived at Nant-Gwillt, near Rhayader, then at Lynmouth in Devonshire, then at Tanyrallt in Carnarvonshire. All this was between September, 1811, and February, 1813. At Lynmouth an Irish servant of Shelley's was sentenced to six months' imprisonment for distributing and posting up printed papers, bearing no printer's name, of an inflammatory or seditious tendency—being a *Declaration of Rights* composed by the youthful reformer, and some verses of his named *The Devil's Walk*. At Tanyrallt Shelley was (to trust his own and Harriet's account, confirmed by the evidence of Miss Westbrook, the elder sister, who continued an inmate in most of their homes) attacked on the night of 26th February by an assassin who fired

three pistol-shots. The motive of the attack was undefined; the fact of its occurrence was generally disbelieved, both at the time and by subsequent inquirers. To analyze the possibilities and probabilities of the case would lead us too far; we can only say that we rank with the decided skeptics. Shelley was full of wild unpractical notions; he dosed himself with laudanum as a palliative to spasmodic pains; he was given to strange assertions and romancing narratives (several of which might properly be specified here but for want of space), and was not incapable of conscious fibbing. His mind no doubt oscillated at times along the line which divides sanity from insane delusion. It is difficult to suppose that he simply invented such a monstrous story to serve a purpose. The very enormity of the story tends to dissuade us from thinking so, and the purpose alleged seems disproportionately small—that of decamping from Tanyrallt ere creditors should become too pressing. Indeed, we decisively reject this supposed motive. On the other hand, nothing could be traced to corroborate Shelley's assertion. This was at any rate the break-up of the residence at Tanyrallt; the Shelleys revisited Ireland, and then settled for a while in London. Here, in June, 1813, Harriet gave birth to her daughter Ianthe Eliza (she married a Mr. Esdaile, and died in 1876). Here also Shelley brought out his first poem of any importance, *Queen Mab;* it was privately printed, as its exceedingly aggressive tone in matters of religion and morals would not allow of publication.

The speculative sage whom Shelley especially reverenced was William Godwin, the author of *Political Justice* and of the romance *Caleb Williams;* in 1796 he had married Mary Wollstonecraft, authoress of *The Rights of Woman*, who died shortly after giving birth, on 30th August, 1797, to a daughter Mary. With Godwin Shelley had opened a volunteered correspondence late in 1811, and he had known him personally since the winter which closed 1812. Godwin was then a bookseller, living with his second wife, who had been a Mrs. Clairmont; there were four other inmates of the household, two of whom call for some mention here—Fanny Wollstonecraft, the daughter of the authoress and Mr. Imlay, and Claire, the daughter of Mrs. Clairmont. Fanny committed suicide in October, 1816, being, according to some accounts which remain unverified, hopelessly in love with Shelley; Claire was closely associated with all his subsequent career. It was towards May, 1814, that Shelley first saw Mary Wollstonecraft Godwin as a grown-up girl (she was well on towards seventeen); he instantly fell in love with her, and she with him. Just before this, 24th March, Shelley had remarried Harriet in London, though with no obviously cogent motive for doing so; but, on becoming enamored of Mary, he seems to have rapidly made up his mind that Harriet should not stand in the way. She was at Bath while he was in London, and for awhile she heard nothing of him. They had, however, met again in London and come to some sort of understanding before the final crisis arrived,—Harriet remonstrating and indignant, but incapable of effective resistance,—Shelley sick of her companionship, and bent upon gratifying his own wishes, which as we have already seen were not at odds with his avowed principles of conduct. For some months past there had been bickerings and misunderstandings between him and Harriet, aggravated by the now detested presence of Miss Westbrook in the house; more than this cannot be said, for no more is at present known. It is certain, however, that evidence exists which, while not plainly proving any grave wrongdoing on Harriet's part, exculpates Shelley from the charge of having separated from her without what appeared to himself sufficient cause. The upshot came on 28th July, when Shelley aided Mary to elope from her father's house, Claire Clairmont deciding to accompany them. They crossed to Calais, and proceeded across France into Switzerland. Godwin and his wife were greatly incensed. Though he and Mary Wollstonecraft had entertained and avowed bold opinions regarding the marriage-bond, similar to Shelley's own, and had in their time acted upon these opinions, it is not clearly made out that Mary Godwin had ever been encouraged by paternal influence to think or do the like. Shelley and she chose to act upon their own likings and responsibility,—he disregarding any claim which Harriet had upon him, and Mary setting at nought her father's authority. Both were prepared to ignore the law of the land and the rules of society.

The three young people returned to London in September. In the following January Sir Bysshe Shelley died, and Percy became the immediate heir to the entailed property inherited by his father Sir Timothy. This entailed property seems to have been worth £6000 [$29,160] per annum, or little less. There was another very much larger property which Percy might shortly before have secured to himself, contingently upon his father's death, if he would have consented to put it upon the same footing of entail; but this he resolutely refused to do, on the professed ground of his being opposed upon principle to the system of entail; therefore, on his grandfather's death the larger property passed wholly away from any interest which Percy might have had in it, in use or in expectancy. He now came to an understanding with his father as to the remaining entailed property; and, giving up certain future advantages, he received henceforth a regular income of £1000 [$4860] a year. Out of this he assigned £200 [$972] a year to Harriet, who had given birth in November to a son, Charles Bysshe (he died in 1826). Shelley, and Mary as well, were on moderately good terms with Harriet, seeing her from time to time. His peculiar views as to the relations of the sexes appear markedly again in his having (so it is alleged) invited Harriet to return to his and Mary's house as a domicile; of course this curious arrangement did not take effect. Shelley and Mary (who was naturally always called Mrs. Shelley) now settled at Bishopgate, near Windsor Forest: here he produced his first excellent poem, *Alastor, or the Spirit of Solitude*, which was published soon afterwards along with a few others. In May, 1816, the pair left England for Switzerland, together with Miss Clairmont, and their own infant son William. They went straight to Sécheron, near Geneva; Lord Byron, whose separation from his wife had just then taken place, arrived there immediately afterwards. A great deal of controversy has lately arisen as to the motives and incidents of this foreign sojourn. The clear fact is that Miss Clairmont, who had a fine voice and some inclination for the stage, had seen Byron, as connected with the management of Drury Lane theatre, early in the year, and an amorous intrigue had begun between them in London. *Prima facie* it seems quite reasonable to suppose that she had explained the facts to Shelley or to Mary, or to both, and had induced them to convoy her to the society of Byron abroad; were this finally established as the fact, it would show no inconsistency of conduct, or breach of his own code of sexual morals, on Shelley's part. On the other hand it is asserted that documentary evidence of an irrefragable kind exists showing that Shelley and Mary were totally ignorant of the amour shortly before they went abroad. Whether or not they knew of it while they and Claire were in daily intercourse with Byron, and housed close by him on the shore of the Lake of Geneva, may be left unargued. The three returned to London in September, 1816, Byron remaining abroad; and in January, 1817, Miss Clairmont gave birth to his daughter named Allegra. The return of the Shelleys was closely followed by two suicides,—first that of Fanny Wollstonecraft (already referred to), and second that of Harriet Shelley, who on 9th November drowned herself in the Serpentine. The latest stages of the lovely and ill-starred Harriet's career have never been very explicitly recorded. It seems that she formed

a connection with some gentleman from whom circumstances or desertion separated her, that her habits became intemperate, and that she was treated with contumelious harshness by her sister during an illness of their father. She had always had a propensity (often laughed at in earlier and happier days) to the idea of suicide, and she now carried it out in act—possibly without anything which could be regarded as an extremely cogent predisposing motive, although the total weight of her distresses, accumulating within the past two years and a half, was beyond question heavy to bear. Shelley, then at Bath, hurried up to London when he heard of Harriet's death, giving manifest signs of the shock which so terrible a catastrophe had produced on him. Some self-reproach must no doubt have mingled with his affliction and dismay; yet he does not appear to have considered himself gravely in the wrong at any stage in the transaction, and it is established that in the train of quite recent events which immediately led up to Harriet's suicide he had borne no part.

This was the time when Shelley began to see a great deal of Leigh Hunt, the poet and essayist, editor of *The Examiner;* they were close friends, and Hunt did something (hardly perhaps so much as might have been anticipated) to uphold the reputation of Shelley as a poet—which, we may here say once for all, scarcely obtained any public acceptance or solidity during his brief lifetime. The death of Harriet having removed the only obstacle to a marriage with Mary Godwin, the wedding ensued on 30th December, 1816, and the married couple settled down at Great Marlow in Buckinghamshire. Their tranquillity was shortly disturbed by a Chancery suit set in motion by Mr. Westbrook, who asked for the custody of his two grandchildren, on the ground that Shelley had deserted his wife and intended to bring up his offspring in his own atheistic and anti-social opinions. Lord Chancellor Eldon delivered judgment towards 26th March, 1817. He held that Shelley, having avowed condemnable principles of conduct, and having fashioned his own conduct to correspond, and being likely to inculcate the same principles upon his children, was unfit to have the charge of them. He therefore assigned this charge to Mr. and Miss Westbrook, and appointed as their immediate curator Dr. Hume, an orthodox army physician, who was Shelley's own nominee. The poet had to pay for the maintenance of the children a sum which stood eventually at £120 [$583.20] per annum; if it was at first (as generally stated) £200 [$972] that was no more than what he had previously allowed to Harriet. This is the last incident of marked importance in the perturbed career of Shelley; the rest relates to the history of his mind, the poems which he produced and published, and his changes of locality in travelling. In March, 1818, after an illness which he regarded (rightly or wrongly) as a dangerous pulmonary attack, Shelley, with his wife, their two infants William and Clara, and Miss Clairmont and her baby Allegra, went off to Italy, in which country the whole short remainder of his life was passed. Allegra was soon sent on to Venice, to her father Byron, who, ever since parting from Miss Clairmont in Switzerland, showed a callous and unfeeling determination to see and know no more about her. In 1818 the Shelleys—mostly, not always, with Miss Clairmont in their company—were in Milan, Leghorn, the Bagni di Lucca, Venice and its neighborhood, Rome, and Naples; in 1819 in Rome, the vicinity of Leghorn, and Florence (both their infants were now dead, but a third was born late in 1819, the present baronet, Sir Percy Florence Shelley); in 1820 in Pisa, the Bagni di Pisa (or di San Giuliano), and Leghorn; in 1821 in Pisa and with Byron in Ravenna; in 1822 in Pisa and on the Bay of Spezia, between Lerici and San Terenzio. The incidents of this period are but few, and of no great importance apart from their bearing upon the poet's writings. In Leghorn he knew Mr. and Mrs. Gisborne, the latter a once intimate friend of Godwin; she taught Shelley Spanish, and he was eager to promote a project for a steamer to be built by her son by a former marriage, the young engineer Henry Reveley; it would have been the first steamer to navigate the Gulf of Lyons. In Pisa he formed a sentimental intimacy with the Contessina Emilia Viviani, a girl who was pining in a convent pending her father's choice of a husband for her; this impassioned but vague and fanciful attachment—which soon came to an end, as Emilia's character developed less favorably in the eyes of her Platonic adorer—produced the transcendental love-poem of *Epipsychidion* in 1821. In Ravenna the scheme of the quarterly magazine *The Liberal* was concerted by Byron and Shelley, the latter being principally interested in it with a view to benefiting Leigh Hunt by such an association with Byron. In Pisa Byron and Shelley were very constantly together, having in their company at one time or another Captain Medwin (cousin and schoolfellow of Shelley, and one of his biographers), Lieutenant and Mrs. Williams, to both of whom our poet was very warmly attached, and Captain Trelawny, the adventurous and romantic-natured seaman who has left important and interesting reminiscences of this period. Byron admired very highly the generous, unworldly, and enthusiastic character of Shelley, and set some value on his writings; Shelley half-worshipped Byron as a poet, and was anxious, but in some conjunctures by no means able, to respect him as a man. In Pisa he knew also Prince Alexander Mavrocordato, one of the pioneers of Grecian insurrection and freedom; the glorious cause fired Shelley, and he wrote the drama of *Hellas* (1821).

The last residence of Shelley was the Casa Magni, a bare and exposed dwelling on the Gulf of Spezia. He and his wife, with the Williamses, went there at the end of April, 1822, to spend the summer, which proved an arid and scorching one. Shelley and Williams, both of them insatiably fond of boating, had a small schooner named the "Don Juan" built at Genoa after a design which Williams had procured from a navel friend, and which was the reverse of safe. They received her on 12th May, found her rapid and alert, and on 1st July started in her to Leghorn, to meet Leigh Hunt, whose arrival in Italy had just been notified. After doing his best to set things going comfortably between Byron and Hunt, Shelley returned on board with Williams on 8th July. It was a day of dark, lowering, stifling heat. Trelawny took leave of his two friends, and about half-past six in the evening found himself startled from a doze by a frightful turmoil of storm. The "Don Juan" had by this time made Via Reggio; she was not to be seen, though other vessels which had sailed about the same time were still discernible. Shelley, Williams, and their only companion, a sailor-boy, perished in the squall. The exact nature of the catastrophe was from the first regarded as somewhat disputable, but it is only of late years (1875) that it has been keenly debated. The condition of the "Don Juan" when recovered did not favor any assumption that she had capsized in a heavy sea—rather that she had been run down by some other vessel, a felucca or fishing-smack. In the absence of any counter-evidence this would be supposed to have occurred by accident; but a rumor, not strictly verified and certainly not refuted, exists that an aged Italian seaman on his deathbed confessed that he had been one of the crew of the fatal felucca, and that the collision was intentional, as the men had plotted to steal a sum of money supposed to be on the "Don Juan," in charge of Lord Byron. In fact there was a moderate sum there, but Byron had neither embarked nor intended to embark. This may perhaps be the true account of the tragedy; at any rate Trelawny, the best possible authority on the subject, accepted it as true. He it was who laboriously tracked out the shore-washed corpses of Shelley and Williams, and who undertook the burning of them, after the ancient

Greek fashion, on the shore near Via Reggio, on the 15th and 16th of August. The great poet's ashes were then collected, and buried in the new Protestant cemetery in Rome. He was, at the time of his untimely death, within a month of completing the thirtieth year of his age—a surprising example of rich poetic achievement for so young a man.

The character of Shelley can be considered according to two different standards of estimation. We can estimate the original motive forces in his character; or we can form an opinion of his actions, and thence put a certain construction upon his personal qualities. We will first try the latter method. It cannot be denied by his admirers and eulogists, and is abundantly clear to his censors, that his actions were in some considerable degree abnormal, dangerous to the settled basis of society, and marked by headstrong and undutiful presumption. But it is remarkable that, even among the censors of his conduct, many persons are none the less impressed by the beauty of his character: and this leads us back to our first point—the original motive forces in that. Here we find enthusiasm, fervor, courage (moral and physical), an unbounded readiness to act upon what he considered right principle, however inconvenient or disastrous the consequences to himself, sweetness and indulgence towards others, extreme generosity, and the principle of love for humankind in abundance and superabundance. He respected the truth, such as he conceived it to be, in spiritual or speculative matters, and respected no construction of the truth which came to him recommended by human authority. No man had more hatred or contempt of custom and prescription; no one had a more authentic or vivid sense of universal charity. The same radiant enthusiasm which appeared in his poetry as idealism stamped his speculation with the conception of perfectibility and his character with loving emotion.

In person Shelley was attractive, winning, and almost beautiful, but not to be called handsome. His height was nearly 5 feet 11; he was slim, agile, and strong, with something of a stoop; his complexion brilliant, his hair abundant and wavy, dark-brown but early beginning to grizzle; the eyes, deep-blue in tint, have been termed "stag-eyes"—large, fixed, and beaming. His voice was wanting in richness and suavity—high-pitched, and tending to the screechy; his general aspect, though extremely variable according as his mood of mind and his expression shifted, was on the whole uncommonly juvenile.

From this necessarily very slight account of the life of Shelley we pass to a consideration—and this too must be equally slender—of his works in poetry. If we except Goethe (and for convenience sake leaving out of count any living writers, whose ultimate value cannot at present be assessed), we consider Shelley to be the supreme poet of the new era which, beginning with the French Revolution, remains continuous into our own day. Lord Byron and Victor Hugo come the nearest to Shelley in poetic stature, and each of them might for certain reasons be even preferred to him; Wordsworth also has his numerous champions. The grounds on which we set Shelley highest of all are mainly three. He excels all his competitors in ideality, he excels them in music, and he excels them in importance. By importance we here mean the direct import of the work performed, its controlling power over the reader's thought and feeling, the contagious fire of its white-hot intellectual passion, and the long reverberation of its appeal. Shelley is emphatically the poet of the future. In his own day an alien in the world of mind and invention, and in our day scarcely yet a denizen of it, he appears destined to become, in the long vista of years, an informing presence in the innermost shrine of human thought. Shelley appeared at the time when the sublime frenzies of the French revolutionary movement had exhausted the elasticity of men's thought—at least in England—and had left them flaccid and stolid; but that movement prepared another in which revolution was to assume the milder guise of reform, conquering and to conquer. Shelley was its prophet. As an iconoclast and an idealist he took the only position in which a poet could advantageously work as a reformer. To outrage his contemporaries was the condition of leading his successors to triumph and of personally triumphing in their victories. Shelley had the temper of an innovator and a martyr; and in an intellect wondrously poetical he united speculative keenness and humanitarian zeal in a degree for which we might vainly seek his precursor. We have already named ideality as one of his leading excellences. This Shelleian quality combines, as its constituents, sublimity, beauty, and the abstract passion for good. It should be acknowledged that, while this great quality forms the chief and most admirable factor in Shelley's poetry, the defects which go along with it mar his work too often—producing at times vagueness, unreality, and a pomp of glittering indistinctness, in which excess of sentiment welters amid excess of words. This blemish affects the long poems much more than the pure lyrics; in the latter the rapture, the music, and the emotion are in exquisite balance, and the work has often as much of delicate simplicity as of fragile and flower-like perfection.

In the course of our biographical narrative we have mentioned a few, but only a few, of Shelley's writings; we must now give some curt account of others. Of his early work prior to *Queen Mab*—such romances as *Zastrozzi* and *St. Irvyne*, such verse as the *Fragments of Margaret Nicholson*—we can only here say that they are rubbish. *Alastor* was succeeded (1817) by *The Revolt of Islam*, a poem of no common length in the Spenserian stanza, preaching bloodless revolution; it is amazingly fine in parts, but as a whole somewhat long-drawn and exhausting. This transcendental epic (for such it may be termed) was at first named *Laon and Cythna, or the Revolution of the Golden City*, and the lovers of the story were then brother and sister as well as lovers—an experiment upon British endurance which the publishers would not connive at. The year 1818 produced *Rosalind and Helen*, a comparatively weak poem, and *Julian and Maddalo*, a very strong one—demonstrating in Shelley a singular power of seeing ordinary things with directness, and at once figuring them as reality and transfiguring them into poetry. The next year, 1819, was his culmination, producing as it did the grand tragedy of *The Cenci* and the sublime ideal drama *Prometheus Unbound*, which we have no hesitation in calling his masterpiece. It embodies, in forms of surpassing imagination and beauty, Shelley's deepest and most daring conceptions. Prometheus, the human mind, has invested with the powers proper to himself Jupiter the god of heaven, who thereupon chains and torments Prometheus and oppresses mankind; in other words, the anthropomorphic god of religion is a creation of the human mind, and both the mind of man and man himself are enslaved as long as this god exercises his delegated but now absolute power. Prometheus, who is from of old wedded to Asia, or Nature, protests against and anathematizes the usurper enthroned by himself. At last the anathema takes effect. Eternity, Demogorgon, dismisses Jupiter to unending nothingness. Prometheus is at once unbound, the human mind is free; he is reunited to his spouse Nature, and the world of man passes from thraldom and its degradation into limitless progression, or (as the phrase goes) perfectibility, moral and material. This we regard as in brief the argument of *Prometheus Unbound*. It is closely analogous to the argument of the juvenile poem *Queen Mab*, but so raised in form and creative touch that, whereas to write *Queen Mab* was only to be an ambitious and ebullient tyro, to invent *Prometheus Unbound* was to be the poet of the future. *The Witch of Atlas* (1820) appears to us the most perfect work among all Shelley's longer poems, though it is neither the deepest nor the most interesting. It may be rated as a pure exercise of roving imagination—guided, however, by an intense sense of beauty, and by its author's exceeding fineness of nature. The poem has often been decried as practically unmeaning; we do not subscribe to this opinion. The "witch" of this subtle and magical invention seems to represent that faculty which we term "the fancy"; using this assumption as a clue, we find plenty of meaning in the poem, but necessarily it is fanciful or volatile meaning. The elegy on Keats, *Adonais*, followed in 1821; the *Triumph of Life*, a mystical and most impressive allegory, constructed upon lines marked out by Dante and by Petrarch, was occupying the poet up to the time of his death. The stately fragment which remains is probably but a small portion of the projected whole. The translations—chiefly from Homer, Euripides, Calderon, and Goethe—date from 1819 to 1822, and testify to the poetic endowment of Shelley not less absolutely than his own original compositions. From this list it will be readily seen that Shelley was not only a prolific but also a versatile poet. Works so various in faculty and in form as *The Revolt of Islam*, *Julian and Maddalo*, *The Cenci*, *Prometheus Unbound*, *Epipsychidion*, and the grotesque effusions of which *Peter Bell the Third* is the prime example, added to the consummate array of lyrics, have seldom to be credited to a single writer—one, moreover, who died before he was thirty years of age. In prose Shelley could be as admirable as in poetry: of late years it has even been pretended—but we regard this proposition as worthy of summary rejection—that his best and most enduring work is in the prose form. His letters to Thomas Love Peacock and others, and his uncompleted *Defence of Poetry*, are the chief monuments of his mastery in prose; and certainly no more beautiful prose—having much of the spirit and the aroma of poetry, yet without being distorted out of its proper essence—is to be found in the English language.

The chief original authorities for the life of Shelley (apart from his own writings, which contain a good deal of autobiography, if heedfully sifted and collated) are—(1) the notices by Mrs. Shelley interspersed in her edition of the *Poems;* (2) Hogg's amusing, discerning, and authentic, although in some respects exaggerated, book; (3) Trelawny's *Records;* (4) the *Life* by Medwin; and (5) the articles written by Peacock. Some other writers, especially Leigh Hunt, might be mentioned, but they come less close to the facts. Among biographical works produced since Shelley's death, by authors who did not know him personally, much the largest is *The Real Shelley*, by J. C. Jeafferson (1885); it is controversial in method and decidedly hostile in tendency, and tries a man of genius by tests far from well adapted (in our opinion) to bring out a right result; it contains, however, an ample share of solid information and sharp disquisition. The memoir by W. M. Rossetti, prefixed to an edition of Shelley's *Poems* in two forms of publication, 1870 and 1878, was an endeavor to formulate in brief space, out of the then confused and conflicting records, an accurate account of Shelley—admiring, but not uncandidly one-sided. There is valuable material in Lady Shelley's *Shelley Memorials*, and in Dr. Garnett's *Relics of Shelley;* and the memoir written by Mr. Symonds, in the series *English Men of Letters*, is very agreeably and skilfully done. While we write (November, 1885) Prof. Dowden is engaged upon a life of Shelley, which may be expected to distance all its predecessors in authority and completeness.[1] (W. M. R.)

SHELOMOH IBN GEBIROL. See AVICEBRON.

SHEM. See NOAH. Compare SEMITIC LANGUAGES.

SHEMAHA, a formerly important but now insignificant town in Transcaucasia, in 40° 38′ N. lat. and 66° 19′ E. long., on the Zagolovai, an affluent of the Peerssagat, which falls into the Caspian. It is situated in a mountainous, very picturesque country, covered with luxuriant vegetation, at about 2230 feet above the level of the Black Sea. In 1873 it had 25,087 inhabitants, of whom 18,680 were Tartars and Shachsevans, 5177 Armenians, and 1230 Russians. Some 300 Armenian families now profess Lutheranism—the result of a mission first established at Shemaha about twenty years ago. Shemaha was the capital of the khanate of Shirván, and was known to Ptolemy as Kamachia. Situated as it was on the high road from Europe to India, this old town must at one time have possessed very considerable importance, and evidence of the fact is found in the numerous ruins of large caravansarais, churches, and public buildings. About the middle of the 16th century it was the seat of an English commercial factory, under the well-known traveller Jenkinson (compare RUSSIA, vol. xxi. p. 101), afterwards envoy extraordinary of the khan of Shirván to Ivan the Terrible. In 1742 Shemaha was taken and destroyed by Nadir Shah, who, to punish the inhabitants for their Sunnite creed, built a new town under the same name about 16 miles to the west, at the foot of the main chain of the Caucasus. The new Shemaha was at different times a residence of the khan of Shirván, but it was finally abandoned, and in its place there stands now only a village called Akhsu, whilst the old town was rebuilt, and under the Russians became capital of the government of Shemaha. In recent times Shemaha has suffered greatly from earthquakes: in 1859 it was shaken to its foundations, and in consequence the seat of the governor was removed to Baku; in 1872 (16th January) there occurred a still more terrible shock, from which the town has never recovered. Silk manufacture is the principal industry in Shemaha. In 1873 there were one hundred and thirty silk-winding establishments, owned mostly by Armenians. The industry has, however, since 1864 considerably declined.

The district of Shemaha (4426 square miles), corresponding to the ancient khanate of Shirván, lies along the southern slope of the main chain of the Eastern Caucasus. It contains a population of 97,801 inhabitants (1873), of whom 8493 are Russians, 14,838 Armenians, 73,124 Tartars, 638 Jats (old Persian tribe), and 708 Jews. As everywhere in Transcaucasia, the number of males is considerably in excess over the females (100 to 81). The district occupies a sparsely-wooden mountainous region, completely shut up on the north, and open to the dry, large, and mostly desolate valley of Kura on the south. The climate is generally healthy, rather dry and moderately warm; in the lower parts the people suffer from malarious fever. The annual rain-fall in Shemaha is 14.52 inches, the mean summer temperature 73° Fahr., winter 37°. The soil, mostly of the Tertiary formation, is very rich and of considerable variety. This district occupies in Transcaucasia a foremost place in vine-growing and in the silk industry. The vine region, in the southwest of the district, is a long strip of land of breadth varying from 4 to 20 miles. The highest level of the vine is about 2500 feet above the sea. The plant is left unprotected in winter, and owing to the abundance of water occasioned by the melting snows and the heavy rains in spring, there is no need of irrigation. According to a general survey made in 1875 there are in the district 3098 vineyards, occupying a total of 1754 acres. The other products are principally wheat, cotton and rice. In 1875 the annual vintage at Shemaha was calculated at about 62,160 gallons. The best wine is that of Matrassy. The province of Shirván, now the district of Shemaha, has been frequently the theatre of terrible struggles and bloodshed. It was conquered by the Persians in 1501 under Shah Ismail I., and it continued with brief interruptions to be a part of the Persian dominions until the fall of the Safawí dynasty.

Shemaha, the capital of Shirván, was sacked in 1712 by the Lesghians; eight years later the town and the whole province were devastated by a certain Deghestani, Ala ud-Daulah, who was later recognized by Persia as the khan of Shirván. In 1724 the khanate was taken by Turkey, but ten years later Nadir Shah of Persia reconquered it after terrible ravages. On the departure of Nadir Shah soon afterwards Shirván enjoyed independence under the rule of Mahmud Seyyid, who rebuilt Shemaha. The Russians entered Shirván first in 1723, but soon retired. In 1795 they captured Shemaha as well as Baku; but the conquest was once more abandoned, and Shirván was not finally annexed to Russia until November, 1805, after the voluntary submission of its last khan Mustapha.

SHENANDOAH, a borough of the United States, in Schuylkill county, Pennsylvania, 12 miles north of Pottsville, is the centre of a great coal district, more than half the total yield of the Schuylkill region being produced within 3 miles of the town. Among its buildings are fifteen churches, a theatre, and two public halls. It was founded in 1863, and its population (partly Welsh and German), which increased from 2951 in 1870 to 10,148 in 1880, is estimated at over 15,000 in 1886.

Shenandoah is also the name of a well-known tributary of the Potomac.

SHENDY, a town on the right bank of the Nile, about 130 miles south of Berber and 100 north of Khartúm, which, while its present population does not exceed 2500, was previous to its destruction by the Egyptians in 1822 a place of some 50,000 inhabitants and a station on the great caravan route between Sennâr and Egypt and Mecca. The terrible massacre perpetrated by the Egyptians was in revenge for the treacherous assassination by the native chiefs at Shendy of Ismail Pasha and his suite, who were first drugged and then burned to ashes with their huts. Shendy was the capital of a considerable district, and lies only 20 miles south of the ruins of Meroe.

SHENSTONE, WILLIAM (1714–1763), is one of the best-known minor poets of the 18th century. He owes such distinction as he has at least as much to his choice of subjects and to the peculiarity of his life as to the felicity of his verse. Coming after a generation whose leading poets wrote for fashionable society, he shut himself up in the country, tried to follow the life Arcadian, and wrote in the spirit of a recluse. He inherited the small estate of Leasowes, in the parish of Hales-Owen, Worcestershire. He was born at Leasowes in 1714, and after passing through Pembroke College, Oxford, retired there to realize Pope's ideal in the *Ode to Solitude*, turned his paternal estate into an elaborate landscape garden, and lived there till his death in 1763. From the time that the management of the estate fell into his own hands, "he began," Johnson says, "to point his prospects, to diversify his surface, to entangle his walks, and to wind his waters,—which he did with such judgment and such fancy as to make his little domain the envy of the great and the admiration of the skilful." From this it will be seen that he did not anticipate late sentiment in his love of natural scenery; he was a true child of the Queen Anne

[1] [This work is now published in two volumes.—AM. ED.]

time in his liking for "Nature to advantage dressed." And it would appear from his letters that he was not a contented recluse, but was weakly desirous of the notice of the world in his Arcadian retreat. Still there is a certain air of sincerity in his references to natural beauty and grandeur. Burns wrote of him in the preface to his first issue of poems as a poet "whose divine elegies do honor to our language." Shenstone practiced the elegiac form assiduously, and some of his elegies are not without a certain imposing pomp and dignity of language, but we may safely suppose that it was the sentiments rather than the expression that captivated the peasant poet. His *Pastoral Ballads in Four Parts*, one of his earliest compositions, is also one of his best, and from its use in selections of poetry for the young is much more generally known. The triple rhythm and the simplicity of the language are happily suited to the pastoral fancy, and there is not too much of the artificial diction and imagery of such poetry. Such lines as—

> Yet time may diminish the pain;
> The flower, and the shrub, and the tree
> Which I rear'd for her pleasure in vain
> In time may have comfort for me—

come nearer Wordsworth's ideal of poetic diction than was common in the serious poetry of Shenstone's time. But his *Schoolmistress*, in the Spenserian stanza (published in 1742, and so relieved from any suspicion of being an imitation of Thomson), is the poem by which he keeps a place in literature.

SHEPTON MALLET, a market-town of Somersetshire, England, is situated at the eastern extremity of the Mendip Hills, on the Somerset and Devon and the East Somerset Railways, 5 miles east of Wells and 20 south of Bristol. The church of Sts. Peter and Paul, consisting of chancel, clerestoried nave, and aisles, is specially worthy of notice for its richly carved wooden roof and the ancient monuments of the Mallets and Gournays, formerly possessors of the manor. The grammar school was founded in 1677, and there are also a science and art school in connection with South Kensington, a literary institute, and a mechanics' institute. The principal public buildings are the courthouse (1857), the masonic hall (1861), the prison, and the district hospital (1880). The market cross, one of the finest in the county, 51 feet in height, erected by Agnes and Thomas Buckland in 1500, was restored in 1841. About the end of last century Shepton Mallet had important cloth manufactures, and stocking-knitting was also largely carried on. The brewing of ale and porter is now one of its principal industries, and it has also rope-works and brick and tile works. In the vicinity there are granite quarries and marble, asphalt, and lime works. The population of the urban sanitary district (area, 3572 acres) in 1871 was 5149, and in 1881 it was 5322.

Shepton, previous to the Conquest called Sepeton, was in the possession of the abbots of Glastonbury for four hundred years before it passed to Roger de Courcelle. Afterwards it came into the possession of the barons Malet or Mallet, one of whom was fined for rebellion in the reign of King John. From the Mallets it went to the Gournays, but in 1536 it reverted to the crown, and it is now included in the duchy of Cornwall. The town received the grant of a market from Edward II.

SHERBORNE, an ancient market-town of Dorsetshire, England, on the borders of Somersetshire, is situated on the southern slope of a hill overlooking the river Yeo, on the Southwestern Railway, 6 miles east from Yeovil and 118 southwest from London by rail. In 705 Sherborne was made by Ina, king of the West Saxons, the seat of a bishopric, which in 1078 was removed to Old Sarum (Salisbury). Previous to its removal a great Benedictine abbey had been founded by Bishop Roger. The minster or abbey church of St. Mary possesses a Norman tower, much altered by later additions, and transepts also originally Norman, but the greater part of the building is Perpendicular. It was restored in 1848–58 at an expense of over £32,000 [$155,520], chiefly contributed by Mr. W. Digby and Lord Digby. Ethelbald and Ethelbert, elder brothers of Alfred, were buried behind the high altar of the church, which contains a number of interesting tombs and monuments. Near the minster are the ruins of the castle, originally the palace of the bishops. It was besieged during the wars between Stephen and Maud, and also during those of the Commonwealth, when it was held for the king in 1642 by the marquis of Hertford, and resisted a five days' siege by the earl of Bedford, but was in 1645 taken by Fairfax, when it was dismantled and reduced to ruins. The older portion of the modern mansion was built by Sir Walter Raleigh. Sherborne grammar school, occupying the site of the abbey, was founded by Edward VI. in 1550, and holds a high rank among the public schools of England. Near the abbey close is the hospital of St. John, dating from the 15th century. A literary institution, now called the Macready Institution, was established in 1850. The manor of Sherborne went with the bishop's see, till in the reign of Elizabeth it was conferred on Sir Walter Raleigh. After his attainder it was bestowed by James I. on his favorite, Carr, after which it passed to the Digbys, the present owners. The population of the urban sanitary district (area 411 acres) in 1871 was 5545, and in 1881 it was 5053.

SHERIDAN, the name of an Anglo-Irish family, made illustrious by the dramatist Richard Brinsley, but prominently connected with literature in more than one generation before and after his. We take the family in chronological order.

1. Thomas Sheridan, D.D. (1684–1738), grandfather of the dramatist, was the first to connect the family with literature. He is chiefly known as the favorite companion and confidant of Swift during his later residence in Ireland. But enough is left of his writing to enable us to understand the secret of his attraction for a man not easily pleased. His correspondence with Swift and his whimsical treatise on the *Art of Punning*[1] make perfectly clear from whom his grandson derived his high spirits and delight in practical joking. The *Art of Punning* might have been written by the author of *The Critic*. Swift had a high opinion of his scholarship, and that it was not contemptible is attested by an edition of the *Satires* of Persius, printed at Dublin in 1728. When Swift came to Dublin as dean of St. Patrick's, Sheridan was established there as a schoolmaster of very high repute,—a fashionable schoolmaster, with a small landed patrimony in Cavan, and a bishop in the family two generations back. He so won upon the dean with his mirthfulness, wit, scholarship, good-nature, and honesty that in a short time no party made for the dean's entertainment was considered complete without Sheridan. Sheridan was his confidant in the affair of *Drapier's Letters;* it was at Quilca,[2] Sheridan's country cottage in Cavan, that *Gulliver's Travels* was prepared for the press; and this favored friend was from an early period in their acquaintance one of his most confidential correspondents when at a distance. Through Swift's influence he obtained a living near Cork, but damaged his prospects of further preferment by a feat of unlucky absence of mind. Having to preach at Cork on the anniversary of Queen Anne's death he hurriedly chose a sermon with the text, "Sufficient unto the day is the evil thereof," and was at once struck off the list of chaplains to the lord-lieutenant and forbidden the castle. In spite of this mishap, for which the archdeacon of Cork made amends by the present of a lease worth £250 [$1215] per annum, he "still remained," according to Lord Orrery, "a punster, a quibbler, a fiddler, and a wit," the only person in whose genial presence Swift relaxed his habitual gloom. His latter days

Thomas Sheridan, D.D.

[2] Spelt Quilca, it may be noted, in the second T. Sheridan's *Life of Swift*.

were not prosperous, probably owing to his having "a better knowledge of books than of men or of the value of money," and he died in poverty and ill-health in 1738. The biographers of Brinsley Sheridan are disposed to dwell chiefly on the eccentricities of his ancestors, but both his grandfather and his father gave ample proof of more solid qualities than improvidence and wit. The original source of information about the schoolmaster grandfather is the father's *Life of Swift* (pp. 369–395), where his scholarship is dwelt upon as much as his improvident conviviality and simple kindliness of nature.

Thomas Sheridan.

2. Thomas Sheridan (1721–1788), son of the above, born at Quilca in 1721, had a more conspicuous career than his father. This ambitious father sent him to an English school, Westminster; but he was forced by stress of circumstances to return to Dublin and complete his education at Trinity College. Then he went on the stage and at once made a local reputation. There is a tradition that on his first appearance in London he was set up as a rival to Garrick, and Moore countenances the idea that Garrick remained jealous of him to the end. For this tradition there is little foundation. Sheridan's first appearance in London was at Covent Garden in March, 1744, when, heralded in advance as the brilliant Irish comedian, he acted for three weeks in a succession of leading parts, *Hamlet* being the first. He did not appear in London again till ten years afterwards, when he was the leading actor for a season at the same theatre. In the interval he had been manager of a theatre in Dublin, had married a highly accomplished and well-born lady (see next notice), and had been driven from Dublin as a result of taking the unpopular side in politics. After his season in London he tried Dublin again, but after two years more of unremunerative management he left for England finally in 1758. By this time he had conceived his scheme of British education, and it was to push this rather than his connection with the stage that he crossed St. George's Channel. He lectured at Oxford and Cambridge, and received honorary degrees from both universities in 1758 and 1759. But the scheme did not make way, and we find him in 1760 acting under Garrick at Drury Lane. His merits as an actor may be judged from the description of him in the *Rosciad* (i. 987) at this period. He is placed in the second rank, next to Garrick, but there is no hint of possible rivalry. Churchill describes him as an actor whose conceptions were superior to his powers of execution, whose action was always forcible but too mechanically calculated, and who in spite of all his defects rose to greatness in occasional scenes. Churchill never erred on the side of praising too much, and his description may be accepted as correct, supported as it is by the fact that the actor eked out his income by giving lessons in elocution. Boswell has some amusing remarks on his success with a distinguished Scotch pupil who used his influence to get a pension for him from Lord Bute. Sheridan, however, attracted attention chiefly by his enthusiastic advocacy, in public lectures and books, of his scheme of education, in which oratory was to play a principal part. It is generally said that he traced all the evils and perils of the Commonwealth to the neglect of oratory. But this is a caricature. There was more serious substance in his indictment of the established system of education. His main count was that it did not fit the higher classes for their duties in life, that it was uniform for all and profitable for none; and he urged as a matter of vital national concern that special training should be given for the various professions. Oratory came in as part of the special training of men intended for public affairs, but his main contention was one very familiar now,—that more time should be given in schools to the study of the English language. He rode his hobby with great enthusiasm, published an elaborate and eloquent treatise on education, and lectured on the subject in London, Oxford, Cambridge, Edinburgh, and other towns. In 1769, after a residence of some years in France, partly for economy, partly for his wife's health, partly to study the system of education there, he published a matured *Plan of Education*, with a letter to the king, in which he offered to devote the rest of his life to the execution of his theories on condition of receiving a pension equivalent to the sacrifice of his professional income. His offer was not accepted; but Sheridan, still enthusiastic, retired to Bath, and prepared a pronouncing *Dictionary of the English Language*, with a prosodial grammar. After his son's brilliant success he assisted in the management of Drury Lane, and occasionally acted. His *Life of Swift*, a very entertaining book in spite of its incompleteness as a biography, was published in 1784. He died at Margate in 1788. The year before his death he had a prospect of realizing his scheme of education in Ireland, but the high official who had sought his advice died just as the old man eagerly reached Dublin, and his hopes were disappointed.

Mrs. Frances Sheridan.

3. Frances Sheridan (1724–1766), wife of the above and mother of the dramatist, wrote two novels of high repute in their day, *Sidney Biddulph* and *Nourjahad*, and two plays, *The Discovery* and *The Dupe*. We have it on the authority of Moore that, when *The Rivals* and *The Duenna* were running at Covent Garden, Garrick revived *The Discovery* at Drury Lane, as a counter-attraction, "to play the mother off against the son, taking on himself to act the principal part in it." But the statement, intrinsically absurd, is inaccurate. *The Discovery* was not an old play at the time, but one of Garrick's stock pieces, and Anthony Bromville was one of his favorite characters. It was first produced in 1763. So far from being jealous of the elder Sheridan, Garrick seems to have been a most useful friend to the family, accepting his wife's play—which he declared to be "one of the best comedies he ever read"—and giving the husband several engagements. Mrs. Sheridan's novels and plays were all written in the last six years of her life. She died at Blois in 1766. Her maiden name was Chamberlaine. Her father was a dignitary in the Irish Church, her grandfather an English baronet. Her marriage with the actor was the result of romantic circumstances, fully detailed in the *Memoirs of Mrs. Frances Sheridan*, mentioned below.

Richard Brinsley Sheridan.

4. Richard Brinsley Butler Sheridan (1751–1816), second son of Thomas and Frances Sheridan, was born in Dublin in September, 1751. Moore records for the encouragement of slow boys that the future dramatist was "by common consent of parent and preceptor pronounced an impenetrable dunce." The plain fact is that the expression occurs in a smart letter about him and his sister, written by his mother to a schoolmaster. Mrs. Sheridan wrote that she had been the only instructor of her children hitherto, and that they would exercise the schoolmaster in the quality of patience, "for two such impenetrable dunces she had never met with." One of the children thus humorously described was Richard Brinsley, and the age of the "impenetrable dunce" at the time was seven. At the age of eleven he was sent to Harrow. There, to please orthodox biographers, he gave no such sign of future eminence as is implied in taking a high place in school. Dr. Parr, who was one of his masters, "saw in him vestiges of a superior intellect," but, though he "did not fail to probe and tease him," by no harrassing or tormenting process could he incite the indolent boy to greater industry than was "just sufficient to save him from disgrace." But these facts about young Sheridan's determined indolence in the study of Latin and Greek should be taken in connection with his father's peculiar theories on the subject of English education. The father's theories possibly did not encourage the son to learn Latin and Greek. Why, with his views on the unprofitableness of those

studies, he sent his younger son to Harrow, is not obvious; but it was probably as much for social as for educational reasons. If so, the purpose was answered, for Sheridan was extremely popular at school, winning somehow, Dr. Parr confesses, "the esteem and even admiration of all his schoolfellows," and giving a foretaste of his mysterious powers of getting things done for him by making the younger boys steal apples for his own private store and good-humoredly defying the masters to trace the theft home to him.

Sheridan left Harrow at the age of seventeen, having impressed his schoolfellows at least, who are sometimes better judges than their masters, with a vivid sense of his powers. It was probably his father's design to send him afterwards to Oxford, but the family circumstances were too straitened to permit of it, and the educationist, who had just then returned from France, and was about to launch his appeal to the king on behalf of his new plan of education, took his son home and himself directed and superintended his studies. What his plans were for his brilliant son's future we have no means of knowing, but the probability is that, if the projected academy had become an accomplished fact, he would have tried to make Richard Brinsley an upper master in some one of its numerous departments. There are traces of method in the superficially harum-scarum Irishman's courses, and it looks as if he had intended both of his sons to help him in the magnificent project from which his sanguine temperament expected such great things,—the elder, who had been with him in France, in what would now be called the modern side, and the classically educated younger in the ancient side. Meantime, pending His Majesty's resolution on the projector's offer, Brinsley, besides being trained by his father daily in elocution, and put through a course of English reading in accordance with the system, received the accomplishments of a young man of fashion, had fencing and riding lessons at Angelo's, and began to eat terms at the Middle Temple. His destination apparently was the bar, if fortune should deny him the more glorious career of lieutenant in the new academy through which young England was to be regenerated.

As to how young Sheridan, with a cooler head to regulate his hot Irish blood, looked at his father's grand schemes, we have no record. But it is of importance to remember those schemes, and the exact stage they had now reached, in connection with the accepted view of Sheridan's behavior at this time, which represents him as a mere idler, hanging on at home like an ordinary ne'er-do-well, too indolent to work for any profession, simply enjoying himself and trusting recklessly to chance for some means of livelihood. The fact would seem to be that over and above whatever he did in the way of qualifying himself for a regular career—which possibly was little enough—he began from this time with fundamentally steady purpose to follow the bent of his genius. After leaving Harrow he kept up a correspondence with a school friend who had gone to Oxford. With this youth, whose name was Halhed, he had not competed for school honors; but both had dreams of higher things; and now they concocted together various literary plans, and between them actually executed and published metrical translations of Aristænetus—an obscure Greek or pseudo-Greek author brought to light or invented at the Renaissance, a writer of imaginary amorous epistles. The two literary partners translated his prose into verse which has the qualities of lightness, neatness, and wit, and is in no respect unworthy of being the apprentice-work of Sheridan.

In conjunction with the same young friend he began a farce entitled *Jupiter*. It was not completed, but the fragment is of interest as containing the same device of a rehearsal which was afterwards worked out with such brilliant effect in *The Critic*. Some of the dialogue is very much in Sheridan's mature manner. It would seem, indeed, that at this time, idle as he appeared, Sheridan was deliberately exercising his powers and preparing himself for future triumphs. Moore's theory is that his seeming indolence was but a mask; and extracts given from papers written in the seven years between his leaving Harrow and the appearance of *The Rivals*—sketches of unfinished plays, poems, political letters and pamphlets—show that he was far from idle. He was never much of a reader; he preferred, as he said, to sit and think—a process more favorable to originality than always having a book in his hand; but we may well believe that he kept his eyes open, and his father's connection with fashionable society gave him abundant opportunities. The removal of the family to Bath in 1771[1] extended his field of observation. Anstey's *New Bath Guide* had just been published and had greatly stimulated interest in the comedy of life at this fashionable watering-place.

Presently, too, already a favorite in Bath society from his charming manners and his skill as a writer of graceful and witty verses, the youth played a part in the living comedy which at once made him a marked man. There was in Bath a celebrated musical family —"a nest of nightingales,"—the daughters of the composer Linley, the head of his profession in the fashionable town. The eldest daughter, a girl of sixteen, the prima donna of her father's concerts, was exceeding beautiful, and very much run after by suitors, young and old, honorable and dishonorable. In the latter class was a Captain Mathews, a married man; in the former, young Sheridan. Mathews had artfully won the girl's affections, and persecuted her with his importunities, threatening to destroy himself if she refused him. To protect her from this scoundrel's designs the younger lover, who seems to have acted at first only as a confidential friend, conceived the romantic plan of escorting Miss Linley to a nunnery in France.[2] After performing this chivalrous duty he returned and fought two duels with Mathews, which made a considerable sensation at the time. The youthful pair had gone through the ceremony of marriage in the course of their flight, but Sheridan chivalrously did not claim his wife, but kept the marriage secret, and was sternly denied access to Miss Linley by her father, who did not consider the professionless young man an eligible suitor. Ultimately, after a courtship romantic enough to have satisfied Lydia Languish, they were openly married in April, 1773.

Sheridan's daring start in life after this happy marriage showed a confidence in his genius which was justified by its success. Although he had no income, and no capital beyond a few thousand pounds brought by his wife, he took a house in Orchard Street, Portman Square, furnished it "in the most costly style," and proceeded to return on something like an equal footing the hospitalities of the fashionable world. His wife—"the celebrated Miss Linley"—was a most popular singer, but he would not allow her to appear in public. She was to be heard only at private concerts in their own house, and her beauty and accomplishments combined with her husband's wit to draw crowds of fashionable people to their entertainments. Sheridan's conduct may have been youthful pride and recklessness, the thoughtless magnificence of a strong and confident nature; all the same, it answered the purpose of deep-laid and daring policy. When remonstrated with by a friend, and asked how he found the means of supporting such a costly establishment, he is said to have answered—"My dear friend, it is my means." And so it proved, for his social standing and popularity helped to get a favorable start for his first comedy, *The Rivals*, produced at Covent Garden on the 17th January, 1775.

[1] Miss Lefanu corrects Moore's date of 1770, considering the difference important as bearing on Sheridan's education (*Memoirs*, p. 348).

[2] The letter from Miss Linley to a female friend, giving a minute account of her persecution by Mathews and deliverance by Sheridan, is declared by Mrs. Norton to be a "foolish forgery."—*Macmillan's Magazine*, iii, 178.

The Rivals is said to have been not so favorably received on its first night, owing to its length and to the bad playing of the part of Sir Lucius O'Trigger. But the defects were remedied before the second performance, and the piece at once took that place on the stage which it has never lost. It was the last season but one of Garrick's long career, and the current story preserved by Moore is that the run upon Covent Garden was such as to alarm the veteran of Drury Lane and drive him to extraordinary exertions to counterbalance the attractions of the new play. This seems to be a myth, natural enough in the circumstances, but unfounded in fact, for we have contemporary testimony[1] that Drury Lane was never more crowded than during the last years of Garrick's management, when it was known that he intended to retire from the stage. There were crowded houses at both theatres. Sheridan, though bearing his brilliant success lightly, proceeded at once to take the tide at the flood. *St. Patrick's Day, or the Scheming Lieutenant*, a lively farce, written it is said at the request of Clinch, in gratitude for his coming to the rescue of Sir Lucius, was produced in May. In the course of the year, with the assistance of his musical father-in-law, he wrote the comic opera of *The Duenna;* and by the end of the year, with an eye to the profits of theatrical management, he was in negotiation with Garrick for the purchase of his share of Drury Lane. *The Duenna* was the great theatrical success of the winter of 1775–76 ; it ran even longer than *The Beggar's Opera* had done —up to that time the longest run on record. The bargain with Garrick was completed in June, 1776. The sum paid for the half-share was £35,000 [$170,100] ; of this Sheridan contributed £10,000 [$48,600]. None of his letters show where the money came from, and much wonder has been expressed on the subject; but after all it is not so very mysterious that the most brilliant dramatist of his time, in all the credit of unparalleled success, should have been able to borrow such a sum as this with the best theatrical property to offer as security. There is a tradition that Garrick advanced the money or let it lie at interest ; anyhow, the loan could not have appeared at the time a very risky speculation. Two years afterwards Sheridan and his friends bought the other half of the property for £45,000 [$218,700].

From the first the direction of the theatre would seem to have been mainly in Sheridan's hands. It was opened under the new management in February, 1777, with a purified version of Vanbrugh's *Relapse.* under the title of *A Trip to Scarborough.* This is printed among Sheridan's works, but he has no more title to the authorship than Colley Cibber to that of *Richard III.* His chief task was to remove indecencies; he added very little to the dialogue. Astonishment has been expressed that he should have fallen back on an old play instead of writing a new one. The fact is quoted among the proofs of his indolence. But the new manager, apart from the engagements of a popular man of fashion, probably found work and worry in his novel task of organization sufficient to leave him little leisure for composition. Vanbrugh's play was probably chosen for the simple reason that it suited his company. Possibly also he wished to make trial of their powers before entrusting them with a play of his own. *The School for Scandal* was produced little more than two months afterwards. Mrs. Abington, who had played Miss Hoyden in the *Trip*, played Lady Teazle, who may be regarded as a Miss Hoyden developed by six months' experience of marriage and town life. The actors who played the brothers Surface had been tried in the *Trip* in opposite characters, Charles playing Townly, while Joseph played Tom Fashion. It looks as if shrewd managerial caution was responsible for the delay quite as much as indolence. The former may at least have been in Sheridan's mind the plausible excuse for the latter. There are tales of the haste with which the conclusion of *The School for Scandal* was written, of a stratagem by which the last act was got out of him by the anxious company, and of the fervent "Amen" written on the last page of the copy by the prompter, in response to the author's "Finished at last, thank God!" But, although the conception was thus hurriedly completed, we know from Sheridan's sister that the idea of a "scandalous college" had occurred to him five years before in connection with his own experiences at Bath. His difficulty was to find a story sufficiently dramatic in its incidents to form a subject for the machinations of the character-slayers. He seems to have tried more than one plot, and in the end to have desperately forced two separate conceptions together. The dialogue is so brilliant throughout, and the auction scene and the screen scene so effective, that nobody cares to examine the construction of the comedy except as a matter of critical duty. But a study of the construction brings to light the difficulties that must have worried the author in writing the play, and explains why he was so thankful to have it finished and done with at last. After all, he worried himself in vain, for *The School for Scandal*, though it has not the unity of *The Rivals*, nor the same wealth of broadly humorous incident, is universally regarded as Sheridan's masterpiece. He might have settled the doubts and worries of authorship with Puff's reflection "What is the use of a good plot except to bring in good things?" The vitality of a play depends mainly on its good things in the way of character, incident, and happy saying, and to a very limited extent on their relevance to any central plan.

The third and last of Sheridan's great comedies, *The Critic*, was produced in 1779, the *The School for Scandal* meantime continuing to draw larger houses than any other play every time it was put on the stage. *The Critic* is perhaps the highest proof of Sheridan's skill as a dramatist, for in it he has worked out, with perfect success for all time, a theme which, often as it has been attempted, no other dramatist has ever succeeded in redeeming from tedious circumstantiality and ephemeral personalities. The laughable infirmities of all classes connected with the stage,—authors, actors, patrons, and audience,—are touched off with the lightest of hands; the fun is directed, not at individuals, but at absurdities that grow out of the circumstances of the stage as naturally and inevitably as weeds in a garden. It seems that he had accumulated notes, as his habit was, for another comedy to be called *Affectation.* But apparently he failed to hit upon any story that would enable him to present his various types of affectation in dramatic interaction. The similar difficulty in his satire against scandal, of finding sufficiently interesting materials for the scandalmongers, he had surmounted with a violent effort. This other difficulty he might have surmounted too, if he had had leisure to "sit and think" till the happy thought came. But his energies were now called off in a different direction. His only dramatic composition during the remaining thirty-six years of his life was *Pizarro*, produced in 1799—a tragedy in which he made liberal use of some of the arts ridiculed in the person of Mr. Puff. He is said also to have written more of *The Stranger* than he was willing to acknowledge.

He entered parliament for Stafford in 1780. It was not a sudden ambition to shine on a wider stage after having gained the highest honors of the theatre. Ever since leaving Harrow he had dabbled a little in politics, had sketched letters in the manner of Junius, and began an answer to Johnson's *Taxation no Tyranny.* But he had not made any public appearance as a politician until his acquaintance with Fox led to his appearing on a Westminster platform with the great leader of opposition. Apparently he owed his election for Stafford to more substantial persuasives than the

[1] See *Blackwood's Magazine*, vol. xx., p. 26.

charms of his eloquence. He paid the burgesses five guineas [$25.51] each for the honor of representing them. It was the custom of the time. His first speech in parliament, like the first speech of a great parliamentarian of this century, between whose career and Sheridan's there are many striking points of resemblance and contrast, was a failure. But he persevered, spoke little for a time and chiefly on financial questions, soon took a place among the best speakers in the House, and under the wing of Fox filled subordinate offices in the short-lived ministries of 1782 and 1783. He was under secretary for foreign affairs in the Rockingham ministry, and a secretary of the treasury in the Coalition ministry. This was rapid promotion for a man who owed everything to his own talents, and yet not an excessive recognition of the services of such a speaker as he is described as having proved himself at this exciting period, In debate he had the keenest of eyes for the weak places in an opponent's argument, and the happy art of putting them in an irresistibly ludicrous light without losing his good temper or his presence of mind. In those heated days of parliamentary strife he was almost the only man of mark that was never called out, and yet he had not his match in the weapon of ridicule.

The occasion that gave Sheridan a chance of rising above the reputation of an extremely effective and brilliant debater into the ranks of great parliamentary orators was the impeachment of Warren Hastings. His speeches in that proceeding were by the unanimous acknowledgment of his contemporaries among the greatest delivered in that generation of great orators. The first was in 1787, on Burke's proposal that Hastings should be impeached. Sheridan spoke for three hours, and the effect of his oratory was such that it was unanimously agreed to adjourn and postpone the final decision till the House should be in a calmer mood. Of this, and of his last great speech on the subject in 1794, only brief abstracts have been preserved; but with the second, the four day's speech in Westminster Hall, on the occasion so brilliantly described by Macaulay, posterity has been more fortunate. The reader should, however be cautioned against accepting the version given in a collection of Sheridan's speeches published by a friend after his death. This long passed current as a genuine specimen of Sheridan's eloquence at its best, in spite of Moore's protest that he had in his possession a copy of a shorthand writer's report, and that the two did not correspond. But Gurney's verbatim reports of the speeches on both sides at the trial were published at Sir G. Cornewall Lewis's instigation in 1859, and from them we are able to form an idea of Sheridan's power as an orator. There are passages here and there of gaudily figurative rhetoric, loose ornament, and declamatory hyperbole such as form the bulk of the incorrect version; but the strong common sense, close argumentative force, and masterly presentation of telling facts enable us to understand the impression produced by the speech at the time.[1]

Sheridan's long parliamentary career terminated in 1812. He could not help being to the last a conspicuous figure both in society and in parliament, but from the time of the break up of the Whig party on the secession of Burke he was more or less an "independent member," and his isolation was complete after the death of Fox. The Begum speech remained his highest oratorical achievement. By it he is fixed in the tradition of the House as one of its greatest names. But his opinions on other great questions were given with a force and eloquence worthy of his position. When Burke denounced the French Revolution, Sheridan joined with Fox in vindicating the principle of non-intervention. He maintained that the French people should be allowed to settle their constitution and manage their affairs in their own way. But when the republic was succeeded by the empire, and it became apparent that France under Napoleon would interfere with the affairs of its neighbors, he employed his eloquence in denouncing Napoleon and urging the prosecution of the war. One of his most celebrated speeches was delivered in support of strong measures against the mutineers at the Nore. When the Whigs came into power in 1806 Sheridan was appointed treasurer of the navy, but was denied the honor of admission to the cabinet. After Fox's death he succeeded his chief in the representation of Westminster, and aspired to succeed him as leader of the party, but this claim was not allowed, and thenceforward Sheridan fought for his own hand. When the prince became regent in 1811 Sheridan's private influence with him helped to exclude the Whigs from power. For his interference on this occasion between the regent and his constitutional advisers Sheridan was severely blamed. To judge fairly as to how far he was justified in his conduct as a matter of private ethics, we must take into account his previous relations with the leaders of his party, a point on which Moore, one of the disappointed placemen, is somewhat reticent. Throughout his parliamentary career Sheridan was one of the boon companions of the prince, and his champion in parliament in some dubious matters of payment of debts. But he always resented any imputation that he was the prince's confidential adviser or mouthpiece. A certain proud and sensitive independence was one of the most marked features in Sheridan's parliamentary career. After a coolness arose between him and his Whig allies he refused a place for his son from the Government, lest there should be any suspicion in the public mind that his support had been bought.

His last years were harrassed by debt and disappointment. At the general election of 1812 he stood for Westminster and was defeated, and turned in vain to his old constituency of Stafford. He could not raise money enough to win back their confidence. As a member of parliament he had been safe against arrest for debt, but now that this protection was lost his creditors closed in upon him, and from this time till his death in 1816 the life of Sheridan, broken in health and fortune, discredited in reputation, slighted by old associates, so enfeebled and low-spirited as to burst into tears at a compliment, yet at times vindicating his reputation as the wittiest of boon companions, is one of the most painful passages in the biography of great men. Doubtless, in any attempt to judge of Sheridan as he was apart from his works, we must make considerable deductions from the mass of floating anecdotes that have gathered round his name. It was not without reason that his granddaughter Mrs. Norton denounced the unfairness of judging of the real man from unauthenticated stories about his indolent procrastination, his recklessness in money matters, his drunken feats and sallies, his wild gambling, his ingenious but discreditable shifts in evading and duping creditors. The real Sheridan was not a pattern of decorous respectability, but we may fairly believe that he was very far from being as disreputable as the Sheridan of vulgar legend. Against the stories about his reckless management of his affairs we must set the broad facts that he had no source of income but Drury Lane theatre, that he bore from it for thirty years all the expenses of a fashionable life, and that the theatre was twice burnt to the ground during his proprietorship. Enough was lost in those fires to account ten times over for all his debts. His biographers always speak of his means of living as a mystery. Seeing that he started with borrowed capital, it is possible that the mystery is that he applied much more of his powers to plain matters of business than he affected or got credit for. The records of his wild bets in the betting book of Brook's Club date in the years after the loss of his first wife, to whom he was devotedly attached. The reminiscences of his

[1] For a comparison of the two versions of the speech, and an able exposition of the qualities of Sheridan's oratory see Mr. W. Fraser Rae's *Wilkes, Sheridan, and Fox*, 1874.

son's tutor, Mr. Smyth, show anxious and fidgetty family habits, curiously at variance with the accepted tradition of his imperturbable recklessness. Many of the tricks which are made to appear as the unscrupulous devices of a hunted and reckless debtor get a softer light upon them if we ascribe them to a whimsical, boyish, ungovernable love of fun, which is a well-attested feature of his character. But the real Sheridan, as he was in private life, is irrecoverably gone. Even Moore, writing so soon after his death, had to lament that he could "find out nothing about him." Moore seems to have made an imperfect use of the family papers, and it is on record that Lord Melbourne, who had undertaken to write Sheridan's life, always regretted having handed over his materials to the professional biographer. He died on the 7th of July, 1816, and was buried with great pomp in Westminster Abbey.

There is, unfortunately, no complete authoritative biography of Sheridan. Mrs. Norton, his granddaughter, questioned the accuracy of Moore's *Life* in many particulars, and announced her intention of writing a history of the Sheridans from the family papers, of which Moore had made very partial use. But she never carried out the project. The current statements about the father and grandfather of the dramatist are inaccurate and misleading in several important respects. The best account of them—making allowance for a slight bias of family pride—is to be found in the *Memoirs of Mrs. Frances Sheridan*, by her granddaughter, the dramatist's niece, Miss Lefanu. There is an excellent sketch of Sheridan's political career in Mr. W. Fraser Rae's *Wilkes, Sheridan, and Fox*, and Mrs. Oliphant's *Sheridan*, in the "English Men of Letters" series, interprets his character with the luminous breadth and sympathy always to be expected from her. (W. M.)

SHERÍF, or SHEREEF. See MECCA, vol. xv. p. 678–9.

SHERIFF. For the office of sheriff in England, see COUNTY. For his jurisdiction in the revision of voters, see REGISTRATION. The position of the sheriff as an executive officer in the United States is very similar to that of the English sheriff. He is usually appointed by popular election. The marshals of the United States and their deputies have in each State the same powers in executing the laws of the United States as the sheriffs and their deputies have in executing the laws of the State.

So far as is known the sheriff, notwithstanding the Saxon etymology of his name (shire grieve or reeve), did not exist in Scotland before the beginning of the Norman period. In the feudal system he became the centre of the local administration of justice, the representative of the crown in executive as well as judicial business, and was always a royal officer appointed by and directly responsible to the king. The earliest sheriffs on record belong to the reigns of Alexander I. and David I., and the office was common before the death of Alexander III. In many cases it had become hereditary, the most remarkable instance being that of Selkirk, where a De Sinton held it from 1265 to 1305. The ordinance of Edward I. in 1305 recognized most of the existing officers, but rejected the hereditary character of the office by a declaration that the sheriffs were to be appointed and removable at the discretion of the king's lieutenant and the chamberlain. The inveterate tendency of feudalism reasserted itself, however, notwithstanding various attempts to check it, and an Act of James II. shows that the office had again become hereditary.

One of the consequences was that sheriffs ignorant of law required deputes to discharge their judicial duties. In the course of succeeding reigns, down to that of James VI., the jurisdiction of the sheriffs came to be much limited by grants of baronies and regalities which gave the grantees the right to hold both civil and criminal courts of less or greater jurisdiction to the exclusion of the sheriff.

The civil jurisdiction of the sheriff was originally of very wide extent, and was deemed specially applicable to questions relating to the land within the shire, but after the institution of the court of session in 1532 it became restricted, and all causes relating to property in land, as well as those requiring the action called declarator for establishing ultimate right, and most of those requiring equitable remedies, were withdrawn from it. Nor did it possess any consistorial jurisdiction, as its subjects (marriage, legitimacy, and wills) belonged to the officials of the bishop after the Reformation, when it was transferred to the commissary courts, and at a later period to the court of session. Practically, therefore, the civil jurisdiction of the sheriff fell under the head of actions concluding for payment of money and actions to regulate the possession of land. The criminal jurisdiction of the sheriff was in like manner in its origin of almost universal extent. But this was first limited to cases where the offenders were caught in or shortly after the act, afterwards to cases in which the trial could be held within forty days, and subsequently further restricted as the business of the justiciary court became more organized. The punishment of death, having by long disuse come to be held beyond the power of the sheriff, and the statutory punishments of transportation or penal servitude never having been entrusted to him, his jurisdiction as regards crimes was usually said to be limited to those punishable arbitrarily, that is, by imprisonment, fine, or admonition.

As a consequence of the suppression of the Jacobite rising of 1745, after 1st March, 1748, all heritable sheriffships were extinguished, and no sheriffship was to be thereafter granted either heritably or for life, or for any certain term exceeding one year, but this provision was not taken advantage of, and the office of sheriff-principal practically ceased, though that name is sometimes given to the sheriff-depute, 20 Geo. II. c. 43. The Act declared that there should be but one sheriff-depute or stewart-depute in every shire or stewartry, who was to be an advocate of three years' standing, appointed by the crown, with such continuance as His Majesty should think fit for the next seven years, and after that period *ad vitam aut culpam*. This period was extended by 28 Geo. II. c. 7 for fifteen years, and thereafter (since 1769) the sheriff-depute has held his office *ad vitam aut culpam*. Power was given to him by 20 Geo. II. c. 43 to appoint one or more persons as substitutes during his pleasure, for whom he should be answerable. At first no legal qualification was necessary and no salary paid, but gradually the sheriff-depute delegated more legal business to the substitute, and before 1761 it had become customary for the sheriff-depute to give him some allowance. In 1787 he was placed on the civil establishment and paid by the crown; in 1825 a qualification of three years' standing (now five years by 40 and 41 Vict. c. 50) as an advocate or procurator before a sheriff court was required (6 Geo. IV. c. 23); in 1838 he was made removable by the sheriff-depute, only with the consent of the lord president and lord justice clerk, and it was made compulsory that he should reside in the sheriffdom, the provision of 20 Geo. II. c. 43, which required the sheriff-depute so to reside for four months of each year, being repealed (1 and 2 Vict. c. 119); and in 1877 the right of appointment of the substitutes was transferred from the sheriff-depute to the crown (40 and 41 Vict. c. 50).

While the sheriff-depute has still power to hear cases in the first instance, and is required to hold a certain number of sittings in each place where the sheriff-substitute holds courts, and also once a year a small-debt court in every place where a circuit small-debt court is appointed to be held, the ordinary course of civil procedure is that the sheriff-substitute acts as judge of first instance, with an appeal under certain restrictions from his decision to the sheriff-depute, and from him to the court of session in all causes exceeding £25 [$121.50] in value. An appeal direct from the sheriff-substitute to the court of session is competent, but is not often resorted to.

As regards criminal proceedings, summary trials are usually conducted by the sheriff-substitute; trials with a jury either by him or, in important cases, by the sheriff-depute. The sheriff-substitute also has charge of the preliminary investigation into crime, the evidence in which, called a precognition, is laid before him, and if necessary taken before him on oath at the instance of his procurator-fiscal, the local crown prosecutor.

The duties of the sheriff-depute are now divided into ministerial or administrative and judicial. The ministerial are the supervision of the accounts of the inferior officers of the sheriffdom; the superintendence of parliamentary elections; the holding by himself or his substitutes of the courts for registration of electors; the preparation of the list of persons liable to serve both on criminal and civil juries; the appointment of sheriff officers and supervision of the execution of judicial writs by them; and the striking of the "fiars." He has also to attend the judges of judiciary at the circuit courts for the county or counties over which his jurisdiction extends. He is generally responsible for the peace of the county, and supervises the police establishment. He is *ex-officio* a justice of the peace and commissioner of supply. In addition to those general duties of sheriffs-depute, particular sheriffs are attached to the Board of Supervision for the Relief of the Poor, the Prison Board of Scotland, the Board of Northern Lighthouse Commissioners, and the Scottish Fishery Board.

The judicial duties of the sheriff-depute are, as regards crimes, the trial of all causes remitted by the counsel of the crown for the trial by sheriff and jury, as well as summary trials if he chooses to take them. This now means most crimes for which a maximum of two years' imprisonment (in practice eighteen months is the longest sentence imposed) is deemed sufficient, and which are not by statute reserved for the justiciary court. His civil jurisdiction is regulated by several statutes too technical for detail, but may be said generally to extend to all suits which conclude for payment of money, whatever may be the cause of action, with the exception of a few where the payment depends on status, all actions with reference to the possession of land or right in land, and actions relative to the right of succession to movable property. In bankruptcy he has a cumulative and alternative jurisdiction with the court of session, and in the service of heirs with the sheriff of chancery. Formerly the jurisdiction of the sheriff was absolutely excluded after the institution of the court of session in four important classes of action—(1) relative to property in lands or rights in lands; (2) requiring the use of peculiar forms of action, *e.g.*, declarator, reduction, and suspension; (3) involving the exercise of the *nobile officium*, a supreme equitable jurisdiction of the court of session; and (4) for the determination of rights of status, as well as in many cases in which the proceedings rest on special statutes which gave an exclusive jurisdiction to the court of session. But large exceptions have been made by recent legislation from this exclusion. By another series of statutes, for the most part connected with local administration, as the Road, Burial Grounds, Lunacy, Public-houses, and General Police and Education Acts, the jurisdiction of the court of session is excluded either as an original court or a court of review, and the sheriff court has exclusive jurisdiction.

The courts which the sheriff holds are (1) the criminal court; (2) the ordinary civil court; (3) the small-debt court for cases under £12 [$58.32] in value (6 Geo. IV. c. 48); (4) the debts recovery court for cases above £12 [$58.32] and under £50 [$243] in value (30 and 31 Vict. c. 96); and (5) the registration court. His judgment in the criminal court is subject to review by the court of justiciary, and in the ordinary civil court and the debts recovery court by the court of session. In the small debt court it is final, except in certain cases where an appeal lies to the next circuit court of justiciary. The sheriff-substitute may competently exercise all the judicial jurisdiction of the sheriff, subject to appeal in civil cases other than small-debt cases. As regards his administrative functions he assists the sheriff generally, and may act for him in the registration and fiars court, and he superintends the preliminary stage of criminal inquiries consulting with the sheriff if necessary; but the other administrative duties of the office are conducted by the sheriff-depute in person. The salaries of the sheriffs-depute vary from £2000 [$9720] to £500 [$2430] a year, those of sheriffs-substitute from £1400 [$6804] to £500 [$2430].

There is a principal sheriff-clerk appointed by the crown for each county, who has depute clerks under him in the principal towns, and a procurator-fiscal for the conduct of criminal prosecutions for each county and district of a county, who is appointed by the sheriff with the sanction of the home secretary.

Besides the sheriffs of counties, there is a sheriff of chancery appointed by the crown, whose duties are confined to the service of heirs, with a salary of £500 [$2430].

(Æ. M.)

SHERLOCK, THOMAS (1678–1761), bishop of London, the son of Dr. William Sherlock, noticed below, was born at London in 1678. He was educated at Catherine Hall, Cambridge, and in 1704 succeeded his father as master of the Temple. He took a prominent part in the Bangorian controversy against Hoadly, whom he succeeded as bishop of Bangor in 1728; he was afterwards translated to Salisbury in 1734, and to London in 1738. He published against Collins's *Grounds and Reasons of the Christian Religion* a volume of sermons entitled *The Use and Intent of Prophecy in the Several Ages of the World* (1725); and in reply to Woolston's *Discourses on the Miracles* he wrote a volume entitled *The Trial of the Witnesses of the Resurrection of Jesus* (1729), which in a very short time ran through fourteen editions. His *Pastoral Letter* (1750) on "the late earthquakes" had a circulation of many thousands, and four volumes of *Sermons* which he published in his later years (1754–58) were also at one time highly esteemed. He died in 1761. A collected edition of his works in 5 vols. 8vo, by Hughes, appeared in 1830.

SHERLOCK, WILLIAM (1641–1707), dean of St. Paul's, was born at Southwark in 1641, and was educated at Eton and Cambridge (Peterhouse). In 1669 he became rector of St. George, Botolph Lane, London, and in 1681 he was appointed a prebendary of St. Paul's. In 1684 he published *The Case of Resistance to the Supreme Powers stated and resolved according to the Doctrine of the Holy Scriptures*, an ably written treatise, in which he drew the distinction between active and passive obedience which was at that time generally accepted by the high church clergy; in the same year he was made master of the Temple. In 1686 he was reproved for preaching against popery and his pension stopped. After the Revolution he was suspended for refusing the oaths to William and Mary, but before his final deprivation he yielded, justifying his change of attitude in *The Case of the Allegiance due to Sovereign Powers stated and resolved according to Scripture and Reason and the Principles of the Church of England* (1691). During the period of his suspension he wrote a *Practical Discourse concerning Death*, which became very popular and has passed through many editions. In 1690 and 1693 he published volumes on the doctrine of the Trinity which involved him in a warm controversy with South and others. He became dean of St. Paul's in 1691, and died at Hampstead in 1707.

SHERMAN, a city of the United States, in Grayson county, Texas, 73 miles north of Dallas, is a substantially built and flourishing place, with a court-house and a college. Its population, only 1439 in 1870, was 6093 in 1880 and has since increased to about 8000. The surrounding country is a cotton and grain district.

SHERWIN, JOHN KEYSE (1751–1790), engraver and history-painter, was born in 1751 at East Dean in Sussex. His father was a wood-cutter employed in shaping bolts for shipbuilders, and the son followed the same occupation till his seventeenth year, when, having shown an aptitude for art by copying some miniatures with exceptional accuracy, he was befriended by Mr. William Mitford, upon whose estate the elder Sherwin worked, and was sent to study in London, first under John Astley, and then for three years under Bartolozzi—for whom he is believed to have executed a large portion of the plate of Clytie, after Annibal Caracci, published as the work of his master. He was entered as a student of the Royal Academy, and gained a silver medal, and in 1772 a gold medal for his painting of Coriolanus Taking Leave of his Family. From 1774 till 1780 he was an exhibitor of chalk drawing and of engravings in the Royal Academy. Establishing himself in St. James Street as a painter,

designer, and engraver, he speedily attained popularity and began to mix in fashionable society. His drawing of the Finding of Moses, a work of but slight artistic merit, which introduced portraits of the princess royal of England and other leading ladies of the aristocracy, hit the public taste, and, as reproduced by his burin, sold largely. In 1785 he succeeded Woollett as engraver to the king, and he also held the appointment of engraver to the prince of Wales. His professional income rose to about £12,000 [$58,320] a year; but he was constantly in pecuniary difficulties, for he was shiftless, indolent, and without method, open-handed and even prodigal in his benefactions,—and prodigal, too, in less reputable directions, for he became a reckless gambler, and habits of intemperance grew upon him. He died in extreme penury on the 24th of September, 1790,—according to Steevens, the editor of Shakespeare, at "The Hog in the Pound," an obscure alehouse in Swallow Street, or, as stated by his pupil J. T. Smith, in the house of Robert Wilkinson, a printseller in Cornhill.

It is as an engraver that Sherwin is most esteemed; and it may be noted that he was ambidexterous, working indifferently with either hand upon his plates. His drawing is correct, his line excellent, and his textures are varied and intelligent in expression. Such of his plates as the Holy Family after Nicholas Poussin, Christ Bearing the Cross after Murillo, the portrait of the Marquis of Buckingham after Gainsborough, and that of Pitt occupy a high place among the productions of the English school of line-engravers. He also worked after Pine, Dance, and Kauffman.

SHETLAND ISLANDS. See ORKNEY AND SHETLAND.

SHIELD. See ARMS AND ARMOR, and HERALDRY.

SHIELD, WILLIAM (1748–1829), composer of English operas, was born at Swalwell, near Newcastle, in 1748. His father began to teach him singing before he had completed his sixth year, but died three years later, leaving him in charge of guardians who made no provision whatever for continuing his musical education, for which he was thenceforward dependent entirely upon his own aptitude for learning, aided by a few lessons in thoroughbass which he received from Charles Avison. Notwithstanding the difficulties inseparable from this imperfect training, he obtained admission into the opera band in 1772, at first as a second violin, and afterwards as principal viola; and this engagement he retained for eighteen years. In the meantime he turned his serious attention to composition, and in 1778 produced his first comic opera, *The Flitch of Bacon*, at the Little Theatre in the Haymarket, with so great success, that he was immediately engaged as composer to Covent Garden theatre, for which he continued to produce English operas, and other dramatic pieces, in quick succession, until 1797, when he resigned his office, and devoted himself to composition of a different class, producing a great number of very beautiful glees, some instrumental chamber music, and other miscellaneous compositions. He died in London, January 25, 1829, and was buried in the south cloister at Westminster Abbey.

Shield's most successful dramatic compositions were *Rosina*, *The Mysteries of the Castle*, *The Lock and Key*, and *The Castle of Andalusia*. As a composer of songs he was in no degree inferior to his great contemporary Charles Dibdin. Indeed *The Arethusa*, *The Heaving of the Lead*, and *The Post Captain* are as little likely to be forgotten as Dibdin's *Tom Bowling* or *Saturday Night at Sea*. His vein of melody was inexhaustible, thoroughly English in character, and always conceived in the purest and most delicate taste; and hence it is that many of his airs are still sung at concerts, though the operas for which they were written have long been banished from the stage. His *Introduction to Harmony* (1794 and 1800) contains a great deal of valuable information; and he also published a useful treatise, *The Rudiments of Thoroughbass*.

SHIELDS, NORTH. See TYNEMOUTH, within which borough the port is included.

SHIELDS, SOUTH, a seaport, market-town, and municipal and parliamentary borough of Durham, is situated on the south bank of the Tyne, at its mouth, immediately opposite North Shields and Tynemouth, and on the North-Eastern Railway, 18 miles north-east of Newcastle-on-Tyne. It is connected with North Shields and Tynemouth by steam ferries. The town possesses a spacious market-place, and some of the newest streets are wide and handsome, but the old street running along the shore is narrow and mean. Formerly salt was largely manufactured, but the principal industries now are the manufacture of glass and chemicals, and shipbuilding and ship refitting and repairing, for which there are docks capable of receiving the largest vessels. The North-Eastern Railway Company posseses extensive docks, and the port has a large trade in coal; but, owing to the fact that in the shipping returns of the United Kingdom it is included under the general title "Tyne Ports," it is impossible to give an accurate statement regarding the number and tonnage of vessels. The number of fishing vessels connected with the port in 1884 was 15, of 204 tons and employing 98 men. At the mouth of the Tyne there is a pier about a mile in length. A townsman of South Shields, William Wouldhave, was the inventor of the lifeboat, and the first lifeboat was built there by Henry Greathead, and first used in a storm in 1789.[1] The principal public buildings are the church of St. Hilda, with a picturesque old tower; the town-hall in the market-place; the exchange; the custom-house; the mercantile marine offices; the public library and museum, which includes a large hall for public meetings and a school of science and art in connection with South Kensington; the high school, the grammar school, the marine school, the master-mariners' asylum, the Ingham infirmary, and the union workhouse. There is a pleasant marine park near the pier. On elevated ground near the harbor are the remains of a Roman station, where numerous coins, portions of an altar, and several sculptured memorial stones have been dug up. The site of the old station was afterwards occupied by a fort of considerable strength, which was captured by the Scots under Colonel Stewart, 20th March, 1644. The town was founded by the convent of Durham about the middle of the 13th century, but on account of the complaints of the burgesses of Newcastle an order was made in the 43d year of Henry III., stipulating that no ships should be laden or unladen at Shields, and that no "shoars" or quays should be built there. This early check seems to have been long injurious to its prosperity, for until the present century it was little more than a fishing station. It received a charter of incorporation in 1850, and is divided into three wards, governed by a mayor, eight aldermen, and twenty-four councillors. In 1832 it received the privilege of returning a member to parliament. The corporation act as the urban sanitary authority, and the town has a specially good water supply from reservoirs at Cleadon. The population of the municipal and parliamentary borough (area 1839 acres) was 45,336 in 1871, and in 1881 it was 56,875.

SHI'ITES. See SUNNITES AND SHI'ITES.

SHIKÁRPUR, a British district in the province of Sind, Bombay presidency, India, with an area of 10,000 square miles, lying between 27° and 29° N. lat. and between 67° and 70° E. long. It is bounded on the N. by Khelat, Upper Sind Frontier district, and the river Indus;[2] on the E. by the native states of Bahawalpur and Jaisalmir; on the S. by Khairpur state; and on the W. by the Khirthar Mountains. Shikárpur is a vast alluvial plain, broken only at Sukkur and Rohri by limestone hills. The Kirthar range attains an elevation of 7000 feet, and forms a natural boundary between the district and Baluchistan. Ex-

[1] [Lionel Lukin is credited with the invention and construction of the first lifeboat; for details see vol. xiv. p. 575.—AM. ED.]

[2] [The Indus river traverses the district here described in a southwest direction.—AM. ED.]

tensive patches of salt land, known as *kalar*, are frequently met with, especially in the upper portion of Shikárpur, and towards the Jacobabad frontier barren tracts of clay land and ridges of sand-hills, covered with caper and thorn jungle, form a poor but distinctive feature in the landscape. The desert portion of Rohri subdivision, known as the Registhán, is very extensive. The forests (207 square miles) are situated on the banks of the Indus, mostly in the Rohri and Shikárpur subdivisions. The Indus Valley State Railway runs through the district, and the Kandahar railway also goes through a part of it.

In 1881 the population numbered 852,986 (males 461,033, females 391,953), of whom 93,341 were Hindus, 684,275 Mohammedans, and 736 Christians. The chief towns are Shikárpur, Sukkur (population 27,389), Larkhana (13,188), and Rohri (10,224). The cultivated land in 1882–83 amounted to 764,488 acres, of which 108,636 were twice cropped. Cereals—chiefly rice, joár (millet), and wheat—form the principal crops; but a considerable area is also under pulses and oil-seeds. The chief manufactures are carpets and coarse cotton cloths. The total revenue raised in 1882–83 amounted to £234,792 [$1,141,089.12], of which the land contributed £189,869 [$922,763.34]. Passing from the dominion of the caliphs, Shikárpur was overrun by Mahmud of Ghazni in 1025, and a little later was governed by the Sumras, the Sammas, and the Arghuns in succession. The Kalhora dynasty came into prominence in the 18th century, and was followed by the Tálpur mirs, who annexed a part of the Durani territory and incorporated it in the district. In 1843 Shikárpur passed to the British, and in 1852 the greater part of the Rohri subdivision was resumed from the mir of Khairpur, who had acquired it by fraud.

SHIKÁRPUR, the chief town of the above district, is situated 18 miles west of the Indus, in a tract of low-lying country annually flooded by the canals from that river. It is a great entrepôt for transit trade between the Bolan Pass and Karachi. The population in 1881 numbered 42,496 (males 22,889, females 19,607).

SHILOH, a town of Ephraim, where the sanctuary of the ark was, under the priesthood of the house of Eli. According to 1 Sam. iii. 3, 15, this sanctuary was not a tabernacle but a temple, with doors. But the priestly narrator of Josh. xviii. 1 has it that the tabernacle was set up there by Joshua after the conquest. In Judges xxi. 19 *sq.* the yearly feast at Shiloh appears as of merely local character. Shiloh seems to have been destroyed by the Philistines after the disastrous battle of Ebenezer; *cf.* Jeremiah vii. 12 *sq.* The position described in Judges, *loc. cit.* (*cf. Onomastica*, ed. Lagarde, p. 152), gives certainty to the identification with the modern Seilûn lying some 2 miles east-southeast of Lubbán (Lebonah), on the road from Bethel to Shechem. Here there is a ruined village, with a flat double-topped hill behind it, offering a strong position, which suggests that the place was a stronghold as well as a sanctuary. A smiling and fertile landscape surrounds the hill. The name Seilûn corresponds to Σιλοῦν in Josephus. LXX. has Σηλώ, Σηλώμ. The forms given in the Hebrew Bible (שילה, שילו) have dropped the final consonant, which reappears in the adjective שילוני. On Shiloh in Gen xlix. 10 see JUDAH.

SHIMOGA, or SHEEMOGA, a district in the northwest of the native state of Mysore, Southern India. It forms a part of the Nagar division, and is situated between 13° 30′ and 14° 38′ N. lat. and between 74° 44′ and 76° 5′ E. long. It has an area of 3797 square miles, and is bounded on the N. and W. by the Bombay districts of Dhárwár and N. Kánara, and E. and S. by the districts of Chitaldroog and Kadur. Its river system is twofold; in the east the Tungra, Bhadra, and Varada unite to form the Tungabhadra, which ultimately falls into the Kistna and so into the Bay of Bengal, while in the west a few minor streams flow to the Shirávati, which near the northwestern frontier bursts through the Western Ghâts by the celebrated Falls of Gersoppa, said to be the grandest cataract in India. Flowing over a rocky bed 250 yards wide, the river here throws itself in four distinct falls down a tremendous chasm 960 feet deep.

The western half of the district is very mountainous and covered with magnificent forest, and is known as the Malnád or hill country, some of the peaks being 4000 feet above sea-level. The general elevation of Shimoga is about 2000 feet; and towards the east it opens out into the Maidán or plain country, which forms part of the general plateau of Mysore. The Malnád region is very picturesque, its scenery abounding with every charm of tropical forests and mountain wilds; on the other hand the features of the Maidán country are for the most part comparatively tame. The mineral products of the district include iron-ore and laterite. On the summits of the Ghâts stones possessing magnetic qualities are occasionally found. The soil is loose and sandy in the valleys of the Malnád, and in the northeast the black cotton soil prevails. Bison are common in the *talúk* of Sagar, where also wild elephants are occasionally seen; while tigers, leopards, bears, wild hogs, *sámbhar* and *chitál* deer, and jungle sheep are numerous in the wooded tracts of the west. Shimoga presents much variety of climate. The southwest monsoon is felt in full force for about 25 miles from the Ghâts, bringing an annual rainfall of more than 150 inches, but the rainfall gradually diminishes to 31 inches at Shimoga station and to 25 inches or less at Chennagiri. There is no railroad in the district, but it contains 225 miles of roads.

The population in 1881 was 499,728 (males 259,296, females 240,432); Hindus numbered 470,678, Mohammedans 27,574, and Christians 1476. The only place with more than 10,000 inhabitants is Shimoga town, the capital and headquarters, which is situated on the Tunga river, with a population of 12,040. Rice is the staple food-crop of the district; the next in importance is sugar-cane; areca-nuts are also extensively grown; and miscellaneous crops include oil-seeds, vegetables, fruits, pepper, and cardamoms. Of the total area of 3797 square miles only 699 are returned as cultivated and 702 as cultivable. The chief manufactures are coarse cotton cloths, rough country blankets or *kamblis*, iron implements, brass and copper wares, pottery, and jaggery. The district is also noted for its beautiful sandal-wood carving.

During the Mohammedan usurpation of Mysore from 1761 to 1799, unceasing warfare kept the whole country in constant turmoil. After the restoration of the Hindu dynasty Shimoga district repeatedly became the scene of disturbances caused by the maladministration of the Deshasta Bráhmans, who had seized upon every office and made themselves thoroughly obnoxious. These disturbances culminated in the insurrection of 1830, which led to the direct assumption of the entire state by the British.

SHINTO. See JAPAN, vol. xiii. p. 590.

SHIP. The generic name (A. S. *scip*, Ger. *Schiff*, Gr. σκάφος, from the root *skap*, *cf.* "scoop") for the invention by which man has contrived to convey himself and his goods upon water points in its derivation to the fundamental conception by which, when realized, a means of flotation was obtained superior to the raft, which we may consider the earliest and most elementary form of vessel. The trunk of a tree hollowed out, whether by fire or by such primitive tools as are fashioned and used with singular patience and dexterity by savage races, represents the first effort to obtain flotation depending on something other than the mere buoyancy of the material. The poets, with characteristic insight, have fastened upon these points. Homer's hero Ulysses is instructed to make a raft with a raised platform upon it, and selects trees "withered of old, exceeding dry, that might float lightly for him" (*Od.*, v. 240). Virgil, glorifying the dawn and early progress of the arts, tells us, "Rivers then first the hollowed alders felt" (*Georg.*, i. 136, ii. 451). Alder is a heavy wood and not fit for rafts. But to make for the first time a dug-out canoe of alder, and so to secure its flotation, would be a triumph of primitive art, and thus the poet's expression represents a great step in the history of the invention of the ship.

Primitive efforts in this direction may be classified in the following order: (1) rafts—floating logs, or bundles of brushwood or reeds or rushes tied together; (2) dug-outs—hollowed trees; (3) canoes of bark, or of skin stretched on framework or inflated skins (balsas); (4) canoes or boats of pieces of wood stitched or

fastened together with sinews or thongs or fibres of vegetable growth; (5) vessels of planks, stitched or bolted together with inserted ribs and decks or half decks; (6) vessels of which the framework is first set up, and the planking of the hull nailed on to them subsequently. All these in their primitive forms have survived, in various parts of the world, with different modifications marking progress in civilization. Climatic influences and racial peculiarities have imparted to them their specific characteristics, and, combined with the available choice of materials, have determined the particular type in use in each locality. Thus on the northwest coast of Australia is found the single log of buoyant wood, not hollowed out but pointed at the ends. Rafts of reeds are also found on the Australian coast. In New Guinea catamarans of three or more logs lashed together with rattan are the commonest vessel, and similar forms appear on the Madras coast and throughout the Asiatic islands. On the coast of Peru rafts made of a very buoyant wood are in use, some of them as much as 70 feet long and 20 feet broad; these are navigated with a sail, and, by an ingenious system of centre boards, let down either fore or aft between the lines of the timbers, can be made to tack. The sea-going raft is often fitted with a platform so as to protect the goods and persons carried from the wash of the sea. Upright timbers fixed upon the logs forming the raft support a kind of deck, which in turn is itself fenced in and covered over.[1] Thus the idea of a deck, and that of side planking to raise the freight above the level of the water and to save it from getting wet, are among the earliest typical expedients which have found their development in the progress of the art of shipbuilding.

Whether the observation of shells floating on the water, or of split reeds, or, as some have fancied, the nautilus, first suggested the idea of hollowing out the trunk of a tree, the practice ascends to a very remote antiquity in the history of man. Dug-out canoes of a single tree have been found associated with objects of the Stone Age among the ancient Swiss lake dwellings; nor are specimens of the same class wanting from the bogs of Ireland and the estuaries of England and Scotland, some obtained from the depth of 25 feet below the surface of the soil. The hollowed trunk itself may have suggested the use of the bark as a means of flotation. But, whatever may have been the origin of the bark canoe, its construction is a step onwards in the art of shipbuilding. For the lightness and pliability of the material necessitated the invention of some internal framework, so as to keep the sides apart, and to give the stiffness required both for purposes of propulsion and the carrying of its freight. Similarly, in countries where suitable timber was not to be found, the use of skins or other water-tight material, such as felt or canvas, covered with pitch, giving flotation, demanded also a framework to keep them distended and to bear the weight they had to carry. In the frame-work we have the rudimentary ship, with longitudinal bottom timbers, and ribs, and cross-pieces, imparting the requisite stiffness to the covering material. Bark canoes are found in Australia, but the American continent is their true home. In northern regions skin or woven material made water-tight supplies the place of bark.

The next step in the construction of vessels was the building up of canoes or boats by fastening pieces of wood together in a suitable form. Some of these canoes, and probably the earliest in type, are tied or stitched together with thongs or cords. The Madras surf boats are perhaps the most familiar example of this type, which, however, is found in the Straits of Magellan and in Central Africa (on the Victoria Nyanza), in the Malay Archipelago and in many islands of the Pacific. Some of these canoes show a great advance in the art of construction, being built up of pieces fitted together with ridges on their inner sides, through which the fastenings are passed.[2] These canoes have the advantage of elasticity, which gives them ease in a seaway, and a comparative immunity where ordinary boats would not hold together. In these cases the body of the canoe is constructed first and built to the shape intended, the ribs being inserted afterwards, and attached to the sides, and having for their main function the uniting of the deck and cross-pieces with the body of the canoe. Vessels thus stitched together, and with an inserted framework, have from a very early time been constructed in the Eastern seas far exceeding in size anything that would be called a canoe, and in some cases attaining to 200 tons burden.

From the stitched form the next step onwards is to fasten the materials out of which the hull is built up by pegs or treenails; and of this system early types appear among the Polynesian islands and in the Nile boats described by Herodotus (ii. 96), the prototype of the modern "nuggur." The raft of Ulysses described by Homer presents the same detail of construction. It is remarkable that some of the early types of boats belonging to the North Sea present an intermediate method, in which the planks are fastened together with pins or treenails, but are attached to the ribs by cords passing through holes in the ribs and corresponding holes bored through ledges cut on the inner side of each plank.

We thus arrive, in tracing primitive efforts in the art of ship construction, at a stage from which the transition to the practice of setting up the framework of ribs fastened to a timber keel laid lengthwise, and subsequently attaching the planking of the hull, was comparatively simple. The keel of the modern vessel may be said to have its prototype in the single log which was the parent of the dug-out. The side planking of the vessel, which has an earlier parentage than the ribs, may be traced to the attempt to fence in the platforms upon the sea-going rafts, and to the planks fastened on to the sides of dug-out canoes so as to give them a raised gunwale.[3] The ribs of the modern vessel are the development of the framework originally inserted after the completion of the hull of the canoe or built-up boat, but with the difference that they are now prior in the order of fabrication. In a word, the skeleton of the hull is now first built up, and the skin, etc., adjusted to it; whereas in the earlier types of wooden vessels the outside hull was first constructed, and the ribs, etc., added afterwards. It is noticeable that the invention of the outrigger and weather platform, the use of which is at the present time distributed from the Andaman Islands eastward throughout the whole of the South Pacific, has never made its way into the Western seas. It is strange that Egyptian enterprise, which seems at a very early period to have penetrated eastward down the Red Sea and round the coasts of Arabia towards India, should not have brought it to the Nile, and that the Phœnicians, who, if the legend of their migration from the shores of the Persian Gulf to the coast of Canaan be accepted, would in all probability, in their maritime expeditions, have had opportunities of seeing it, did not introduce it to the Mediterranean. That they did not do so, if they saw it at all, would tend to prove that even in that remote antiquity both nations possessed the art of constructing vessels of a type superior to the outrigger canoes, both in speed and in carrying power.

The earliest representations that we have as yet of Egyptian vessels carry us back, according to the best authorities, to a period little short of 3000 years before Christ. Some of these are of considerable size, as is shown by the number of rowers, and by the cargo consisting in many cases of cattle. The earliest of all presents us with the peculiar mast of two pieces, stepped

[1] The raft of Ulysses described in Homer (*Od.*, v.) must have been of this class.

[2] See Capt. Cook's account of the Friendly Islands, La Pérouse on Easter Island, and Williams on the Fiji Islands.

[3] Compare the planks upon the Egyptian war galleys, added so as to protect the rowers from the missiles of the enemy.

apart but joined at the top. In some the masts are shown lowered and laid along a high spar-deck. The larger vessels show on one side as many as twenty-one or twenty-two and in one case twenty-six oars, besides four or five steering. They show considerable camber, the two ends rising in a curved line which in some instances ends in a point, and in others is curved back and over at the stern and terminates in an ornamentation, very frequently of the familiar lotus pattern. At the bow the stem is sometimes seen to rise perpendicularly, forming a kind of forecastle, sometimes to curve backward and then forward again like a neck, which is often finished into a figure-head representing some bird or beast or Egyptian god. On the war galleys there is frequently shown a projecting bow with a metal head attached, but well above the water. This, though no doubt used as a ram, is not identical with the beak *à fleur d'eau*, which we shall meet with in Phœnician and Greek galleys. It is more on a level with the proembolion of the latter.

The impression as regards the build created by the drawings of the larger galleys is that of a long and somewhat wall-sided vessel with the stem and stern highly raised. The tendencies of the vessel to "hog," or rise amidships, owing to the great weight fore and aft unsupported by the water, is corrected by a strong truss passing from stem to stern over crutches. The double mast of the earlier period seems in time to have given place to the single mast furnished with bars or rollers at the upper part, for the purpose apparently of raising or lowering the yard according to the amount of sail required. The sail in some of the galleys is shown with a bottom as well as a top yard. In the war galleys during action it is shown rolled up like a curtain with loops to the upper yard. The steering was effected by paddles, sometimes four or five in number, but generally one or two fastened either at the end of the stern or at the side, and above attached to an upright post in such a way as to allow the paddle to be worked by a tiller.

There are many remarkable details to be observed in the Egyptian vessels figured in Duemichen's *Fleet of an Egyptian Queen*, and in Lepsius's *Denkmäler*. The Egyptian ship, as represented from time to time in the period between 3000 and 1000 B.C., presents to us a ship proper as distinct from a large canoe or boat. It is the earliest ship of which we have cognizance. But there is a noticeable fact in connection with Egypt which we gather from the tomb paintings to which we owe our knowledge of the Egyptian ship. It is evident from these records that there were at that same early period, inhabiting the littoral of the Mediterranean, nations who were possessed of sea-going vessels which visited the coasts of Egypt for plunder as well as for commerce, and that sea-fights were even then not uncommon. Occasionally the combination of these peoples for the purpose of attack assumed serious proportions, and we find the Pharaohs recording naval victories over combined Dardanians, Teucrians, and Mysians, and, if we accept the explanations of Egyptologists, over Pelasgians, Daunians, Oscans, and Sicilians. The Greeks, as they became familiar with the sea, followed in the same track. The legend of Helen in Egypt, as well as the numerous references in the *Odyssey*, point not only to the attraction that Egypt had for the maritime peoples, but also to long-established habits of navigation and the possession of an art of shipbuilding equal to the construction of sea-going craft capable of carrying a large number of men and a considerable cargo besides.

But the development of the ship and of the art of navigation clearly belongs to the Phœnicians. It is tantalizing to find that the earliest and almost the only evidence that we have of this development is to be gathered from Assyrian representations. The Assyrians were an inland people, and the navigation with which they were familiar was that of the two great rivers, Tigris and Euphrates. After the conquest of Phœnicia they had knowledge of Phœnician naval enterprise, and accordingly we find the war galley of the Phœnicians represented on the walls of the palaces unearthed by Layard and his followers in Assyrian discovery. But the date does not carry us to an earlier period than 900–800 B.C. The vessel represented is a bireme war galley which is "aphract," that is to say, has the upper tier of rowers unprotected and exposed to view. The apertures for the lower oars are of the same character as those which appear in Egyptian ships of a much earlier date, but without oars. The artist has shown the characteristic details, though somewhat conventionally. The fish-like snout of the beak, the line of the parodus or outside gangway, the wickerwork cancelli,[1] the shields ranged in order along the side of the bulwark, and the heads of a typical crew on deck (the *πρωρεύς* looking out in front in the forecastle, an *ἐπιβάτης*, two chiefs by the mast, and, aft, the *κελευστής* and *κυβερνητής*). The supporting timbers of the deck are just indicated. The mast and yard and fore and back stay, with the double steering paddle, complete the picture.

But, although there can be little doubt that the Phœnicians, after the Egyptians, led the way in the development of the shipwright's art, yet the information that we can gather concerning them is so meagre that we must go to other sources for the description of the ancient ship. The Phœnicians at an early date constructed merchant vessels capable of carrying large cargoes, and of traversing the length and breadth of the Mediterranean, perhaps even of trading to the far Cassiterides and of circumnavigating Africa. They in all probability (if not the Egyptians) invented the bireme and trireme, solving the problem by which increased oarpower and consequently speed could be obtained without any great increase in the length of the vessel.

It is, however, to the Greeks that we must turn for any detailed account of these inventions. The Homeric vessels were aphract and not even decked throughout their entire length. They carried crews averaging from fifty to a hundred and twenty men, who, we are expressly told by Thucydides, all took part in the labor of rowing, except perhaps the chiefs. The galleys do not appear to have been armed as yet with the beak, though later poets attribute this feature to the Homeric vessel. But they had great poles used in fighting, and the term employed to describe these (*ναίμαχα*) implies a knowledge of naval warfare. The general characteristics are indicated by the epithets in use throughout the *Iliad* and the *Odyssey*. The Homeric ship is sharp (*θοή*) and swift (*ὠκεῖα*); it is hollow (*κοιλή, γλαφυρή, μεγακήτης*), black, vermillion-cheeked (*μιλτοπάρῃος*), dark-prowed (*κυανόπρῳρος*), curved (*κορωνίς, ἀμφιέλισσα*), well-timbered (*ἐὐσσελμος*), with many thwarts (*πολύζυγος, ἑκατόζυγος*). The stems and sterns are high, upraised, and resemble the horns of oxen (*ὀρθοκραίραι*). They present a type parallel in the history of the shipping of the Mediterranean with that of the vikings' vessels of the North Sea.

On the vases, the earliest of which may date between 700 and 600 B.C., we find the bireme with the bows finished off into a beak shaped as the head of some sea monster, and an elevated forecastle with a bulwark evidently as a means of defence. The craft portrayed in some instances are evidently pirate vessels, and exhibit a striking contrast to the trader, the broad ship of burden (*φορτὶς εὐρεῖα*), which they are overhauling. The trireme, which was developed from the bireme and became the Greek ship of war (the long ship, *ναῦς μακρά, navis longa, par excellence*), dates, so far as Greek use is concerned, from about 700 B.C. according to Thucydides, having been first built at Corinth by Aminocles. The earliest sea-fight that the same author knew of he places at a somewhat later date,—664 B.C., more than ten centuries later than some of those portrayed in the Egyptian tomb paintings.

[1] See Rawlinson, *Ancient Monarchies*, vol. ii. p. 176.

The trireme was the war ship of Athens during her prime, and, though succeeded and in a measure superseded by the larger rates,—quadrireme, quinquereme, and so on, up to vessels of sixteen banks of oars (*inhabilis prope magnitudinis*),—yet, as containing in itself the principle of which the larger rates merely exhibited an expansion, a difference in degree and not in kind, has, ever since the of revival letters, concentrated upon itself the attention of the learned who were interested in such matters. The literature connected with the question of ancient ships, if collected, would fill a small library, and the greater part of it turns upon the construction of the trireme and the disposition of the rowers therein.

During the present century much light has been thrown upon the disputed points by the discovery (1834) at the Piræus of some records of the Athenian dockyard superintendents, which have been published and admirably elucidated by Boeckh. Further researches carried out by his pupil Dr. Graser, who united a practical knowledge of ships and shipbuilding with all the scholarship and industry and acumen necessary for such a task, have cleared up most of the difficulties which beset the problem, and enable us to describe with tolerable certainty the details of construction and the disposition of the rowers in the ancient ship of war.

One point it is necessary to insist on at the outset, because upon it depends the right understanding of the problem to be solved. The ancients did not employ more than one man to an oar. The method employed in mediæval galleys is entirely alien to the ancient system. M. Jal, Admiral Fincati, Admiral Jurien de la Gravière, and a host of other authorities have all been led to erroneous views by neglect of the ancient texts, which overwhelmingly establish this as an axiom of the ancient marine—"one oar one man."

The distinction between "aphract" and "cataphract" vessels must not be overlooked in a description of the ancient vessels. The words, meaning "unfenced" and "fenced," refer to the bulwarks which covered the upper tier of rowers from attack. In the aphract vessels these side plankings were absent and the upper tier of rowers was exposed to view from the side. Both classes of vessels had upper and lower decks, but the aphract class carried their decks on a lower level than the cataphract. The system of side planking with a view to the protection of the rowers dates from a very early period, as may be seen in some of the Egyptian representations, but among the Greeks it does not seem to have been adopted till long after the Homeric period. The Thasians are credited with the introduction of the improvement.

In describing the trireme it will be convenient to deal first with the disposition of the rowers and subsequently with the construction of the vessel itself. The object of arranging the oars in banks was to economize horizontal space and to obtain an increase in the number of oars without having to lengthen the vessel. We know from Vitruvius that the "interscalmium," or space horizontally measured from oar to oar, was 2 cubits. This is exactly borne out by the proportion of an Attic aphract trireme, as shown on a fragment of a bas-relief found in the Acropolis. The rowers in all classes of banked vessels sat in the same vertical plane, the seats ascending in a line obliquely towards the stern of the vessel. Thus in the trireme the thranite, or oarsman of the highest bank, was nearest the stern of the set of three to which he belonged. Next behind him and somewhat below him sat his zygite, or oarsman of the second bank; and next below and behind the zygite sat the thalamite, or oarsman of the lowest bank. The vertical distance between these seats was 2 feet, the horizontal distance about 1 foot. The horizontal distance, it is well to repeat, between each seat in the same bank was 3 feet (the seat itself about 9 inches broad). Each man had a resting place for his feet, somewhat wide apart, fixed to the bench of the man on the row next below and in front of him. In rowing, the upper hand, as is shown in most of the representations which remain, was held with the palm turned inwards towards the body. This is accounted for by the angle at which the oar was worked. The lowest rank used the shortest oars, and the difference of the length of the oars on board was caused by the curvature of the ship's side. Thus, looked at from within, the rowers amidship seemed to be using the longest oars, but outside the vessel, as we are expressly told, all the oar-blades of the same bank took the water in the same longitudinal line. The lowest or thalamite oar-ports were 3 feet, the zygite 4½ feet, the thranite 5½ feet above the water. Each oar-port was protected by an *ascoma* or leather bag, which fitted over the oar, closing the aperture against the wash of the sea without impeding the action of the oar. The oar was tied by a thong, against which it was probably rowed, which itself was attached to a thowl (σκαλμός). The port-hole was probably oval in shape (the Egyptian and Assyrian pictures show an oblong). We know that it was large enough for a man's head to be thrust through it.

The benches on which the rowers sat ran from the vessel's side to timbers which, inclined at an angle of about 64° towards the ship's stern, reached from the lower to the upper deck. These timbers were, according to Graser, called the diaphragmata. In the trireme each diaphragma supported three, in the quinquereme five, in the octireme eight, and in the famous tesseraconteres forty seats of rowers, who all belonged to the same "complexus," though each to a different bank. In effect, when once the principle of construction had been established in the trireme, the increase to larger rates was effected, so far as the motive power was concerned, by lengthening the diaphragmata upwards, while the increase in the length of the vessel gave a greater number of rowers to each bank. The upper tiers of oarsmen exceeded in number those below, as the contraction of the sides of the vessel left less available space towards the bows.

Of the length of the oars in the trireme we have an indication in the fact that the length of supernumerary oars (περίνεω) rowed from the gangway above the thranites, and therefore probably slightly exceeding the thranitic oars in length, is given in the Attic tables as 14 feet 3 inches. The thranites were probably about 14 feet. The zygite, in proportion to the measurement must have been 10½, the thalamite 7½ feet long. Comparing modern oars with these, we find that the longest oars used in the British navy are 18 feet. The university race is rowed with oars 12 feet 9 inches. The proportion of the loom inboard was about one-third, but the oars of the rowers amidships must have been somewhat longer inboard. The size of the loom inboard preserved the necessary equilibrium. The long oars of the larger rates were weighted inboard with lead. Thus the topmost oars of the tesseraconteres, of which the length was 53 feet, were exactly balanced at the rowlock.

Let us now consider the construction of the vessel itself. In the cataphract class the lower deck was 1 foot above the water line. Below this deck was the hold, which contained a certain amount of ballast, and through an aperture in this deck the buckets for baling were worked, entailing a labor which was constant and severe on board an ancient ship at sea. The keel (τρόπις) appears to have had considerable camber. Under it was a strong false keel (χέλυσμα), very necessary for vessels that were constantly drawn up on the shore. Above the keel was the kelson (δρύοχον), under which the ribs were fastened. These were so arranged as to give the necessary intervals for the oar-ports above. Above the kelson lay the upper false keel, into which the mast was stepped. The stem (στεῖρα) rose from the keel at an angle of about 70° to the water. Within was an apron (φάλκις), which was a strong piece of timber curved and fitting to the end of the keel and beginning of the stern-post and firmly bolted into both, thus giving solidity to the bows, which had to bear the beak and sustain the shock of ramming. The stem was carried upwards and curved generally backwards towards the forecastle and rising above it, and then curving forwards again terminated in an ornament which was called the acrostolion. The stern post was carried up at a similar angle to the bow, and, rising high over the poop, was curved round into an ornament which was called "aplustre" (ἄφλαστον). But, inasmuch as the steering was effected by means of two rudders (πηδάλια), one on either side, there was no need to carry out the stern into a rudder post as with modern ships, and the stern was left therefore much more free, an advantage in respect of the manœuvring of the ancient Greek man-of-war, the weapon being the beak or rostrum, and the power of turning quickly being of the highest importance.

Behind the "aplustre," and curving backwards, was the "cheniscus" (χηνίσκος), or goose head, symbolizing the floating powers of the vessel.[1] After the ribs had been set up and covered in on both sides with planking, the sides of the vessel were further strengthened by waling-pieces carried from stern to stem and meeting in front of the stern-post. These were further strengthened with additional balks of timber, the lower waling-pieces meeting about the water-level and prolonged into a sharp three-toothed spur, of which

[1] [The "cheniscus" sometimes terminated the stern, but usually the stern-post. The rostrum or beak with its subsidiary parts, was attached to the prow as a weapon of offence. Hence, in this paragraph stern should be read instead of stern-post.—Am. Ed.]

the middle tooth was the longest. This was covered with hard metal (generally bronze) and formed the beak. The whole structure of the beak projected about 10 feet beyond the stern-post. Above it, but projecting much less beyond the stern-post, was the "proembolion" (προεμβόλιον), or second beak, in which the prolongation of the upper set of waling-pieces met. This was generally fashioned into the figure of a ram's head, also covered with metal; and sometimes again between this and the beak the second line of waling-pieces met in another metal boss called the προεμβολίς. These bosses, when a vessel was rammed, completed the work of destruction begun by the sharp beak at the water level, giving a raking blow which caused it to heel over and so eased it off the beak, and releasing the latter before the weight of the sinking vessel could come upon it. At the point where the prolongation of the second and third waling-pieces began to converge inwards towards the stem on either side of the vessel stout catheads (ἐπωτίδες) projected, which were of use, not only as supports for the anchors, but also as a means of inflicting damage on the upper part of an enemy's vessel, while protecting the side gangways of its own and the banks of oars that worked under them. The catheads were strengthened by strong balks of timber, which were firmly bolted to them under either extremity and both within and without, and ran to the ship's side. Above the curvature of the upper waling pieces into the προεμβόλιον were the cheeks of the vessel, generally painted red, and in the upper part of these the eyes (ὀφθαλμοί), answering to our hawse holes, through which ran the cables for the anchors. On either side the trireme, at about the level of the thranitic benches, projected a gangway (πάροδος) supported by brackets (βίαχα) springing from the upper waling-piece, and resting against the ribs of the vessel. This projection was of about 18 to 24 inches, which gave a space, increased to about 3 feet by the inward curve of the prolongation of the ribs to form supports for the deck, for a passage on either side of the vessel. This gangway was planked in along its outer side so as to afford protection to the seamen and marines, who could pass along its whole length without impeding the rowers. Here, in action, the sailors were posted as light-armed troops, and when needed could use the long supernumerary oars (περίνεως) mentioned above. The ribs, prolonged upwards upon an inward curve, supported on their upper ends the cross beams (στρωτῆρες) which tied the two sides of the vessel together and carried the deck. In the cataphract class these took the place of the thwarts (ζύγα), which in the earlier vessels, at a lower level, yoked together the sides of the vessel, and formed also benches for the rowers to sit on, from which the latter had their name (ζυγῖται), having been the uppermost tier of oarsmen in the bireme; while those who sat behind and below them in the hold of the vessel were called θαλαμῖται or θαλάμακες (from θάλαμος). In the trireme the additional upper tier was named from the elevated bench (θρᾶνος) on which they were placed (θρανῖται). On the deck were stationed the marines (ἐπιβάται), fighting men in heavy armor, few in number in the Attic trireme in its palmy days, but many in the Roman quinquereme, when the ramming tactics were antiquated, and wherever, as in the great battles in the harbor at Syracuse, land tactics took the place of the maritime skill which gave victory to the ram in the open sea. The space occupied by the rowers was termed ἔγκωπον. Beyond this, fore and aft, were the παρεξειρόσιαι, or parts outside the rowers. These occupied 11 feet of the bows and 14 feet in the stern. In the fore part was the forecastle, with its raised deck, on which was stationed the πρωρεύς with his men. In the stern the decks (ἴκρια) rose in two or three gradations, upon which was a kind of deck-house for the captain and a seat for the steerer (κυβερνήτης), who steered by means of ropes attached to the tillers fixed in the upper part of the paddles, which in later times, at least, ran over wheels (τροχιλίαι), giving him the power of changing his vessel's course with great rapidity. Behind the deck-house rose the flagstaff, on which was hoisted the pennant, and from which probably signals were given in the case of an admiral's ship. On either side of the deck ran a balustrade (*cancelli*), which was covered for protection during action with felt (*cilicium*, παραρρύμματα τριχινά) or canvas (π. λευκά). Above was stretched a strong awning of hide (καπάβλημα), as a protection against grappling irons and missiles of all kinds. In Roman vessels towers were carried up fore and aft from which darts could be showered on the enemy's deck; the heavy corvus or boarding bridge swung suspended by a chain near the bows; and the ponderous δέλφις hung at the ends of the yards ready to fall on a vessel that came near enough alongside. But these were later inventions and for larger ships. The Attic trireme was built light for speed and for ramming purposes. Her dimensions, so far as we can gather them from the scattered notices of antiquity, were probably approximately as follows: length of rowing space (ἔγκωπον) 93 feet; bows 11 feet; stern 14 feet; total 118 feet; add 10 feet for the beak. The breadth at the water-line is calculated at 14 feet, and above at the broadest part 18 feet, exclusive of the gangways; the space between the diaphragmata mentioned above was 7 feet. The deck was 11 feet above the water-line and the draught about 8 to 9 feet. All the Attic triremes appear to have been built upon the same model, and their gear was interchangeable. The Athenians had a peculiar system of girding the ships with long cables (ὑποζώματα), each trireme having two or more, which, passing through eyeholes in front of the stern-post, ran all round the vessel lengthwise immediately under the waling-pieces. They were fastened at the stern and tightened up with levers. These cables, by shrinking as soon as they were wet, tightened the whole fabric of the vessel, and in action, in all probability, relieved the hull from part of the shock of ramming, the strain of which would be sustained by the waling-pieces convergent in the beaks. These rope-girdles are not to be confused with the process of undergirding or frapping, such as is narrated of the vessel in which St. Paul was being carried to Italy. The trireme appears to have had three masts. The mainmast carried square sails, probably two in number. The foremast and the mizzen carried lateen sails. In action the Greeks did not use sails, and everything that could be lowered was stowed below. The mainmasts and larger sails were often left ashore if a conflict was expected.

The crew of the Attic trireme consisted of from 200 to 225 men in all. Of these 174 were rowers,—54 on the lower bank (thalamites), 58 on the middle bank (zygites), and 62 on the upper bank (thranites),—the upper oars being more numerous because of the contraction of the space available for the lower tiers near the bow and stern. Besides the rowers were about 10 marines (ἐπιβάται) and 20 seamen. The officers were the trierarch and next to him the helmsman (κυβερνήτης), who was the navigating officer of the trireme. Each tier of rowers had its captain (στοιχαρχός). There were also the captain of the forecastle (πρωρεύς), the "keleustes" who gave the time to the rowers, and the shipspiper (τριηραυλής). The rowers descended into the seven-foot space between the diaphragmata and took their places in regular order, beginning with the thalamites. The economy of space was such that, as Cicero remarks, there was not room for one man more.

The improvement made in the build of their vessels by the Corinthian and Syracusan shipwrights, by which the bows were so much strengthened that they were able to meet the Athenian attack stem on (πρόσβολή), caused a change of tactics, and gave an impetus to the building of larger vessels—quadriremes and quinqueremes—in which increased oar-power was available for the propulsion of the heavier weights.

In principle these vessels were only expansions of the trireme, so far as the disposition of the rowers was concerned, but the speed could not have increased in proportion to the weight, and hence arose the variety of contrivances which superseded the ramming tactics of the days of Phormio. In the century that succeeded the close of the Peloponnesian War the fashion of building big vessels became prevalent. We hear of various numbers of banks of oars up to sixteen (ἑκκαιδεκήρης)—the big vessel of Demetrius Poliorcetes. The famous tesseraconteres or forty-banked vessel of Ptolemy Philopator was in reality nothing more than a costly and ingenious toy, and never of any practical use. The fact, however, of its construction shows the extent to which the shipwright's art had been developed among the ancients.

The Romans, who developed their naval power during the First Punic War, were deficient in naval construction till they learnt the art from their enemies the Carthaginians. They copied a quinquereme which had drifted on to the coast, and, with crews taught to row on frames set up on dry land, manned a fleet which we are told was built in sixty days from the time the trees were cut down. After the Punic War, in which the use of boarding tactics gave the Romans command of the sea, the larger rates—quinqueremes, hexiremes, octiremes—continued in use until at Actium the fate of the big vessels was sealed by the victory of the light Liburnian galleys. The larger classes, though still employed as guardships for some time, fell into disuse,

and the art of building them and the knowledge of their interior arrangements were lost.

Table of Measurements, etc., after Graser.

	Trireme.	Quinquereme.	Tesseraconteres.
Length, exclusive of beak...	(?) 149 ft.[1]	168 ft.	420 ft.
Beam, greatest.....	18 "	26 "	76 "
Passage between *διαφράγματα*	7 "	11 "	49 "

Number of rowers.....	174	310	4,054 "
Crew, total complement.....	225	375	7,500 "

Mediæval Ships.—It is not at present possible to trace in its successive stages the transition from the ancient ship of war to the mediæval galley. The sailing vessels of the time of the early Roman empire, such as that in which St. Paul suffered shipwreck or the great merchantman described by Lucian, were the direct precursors, not only of the mediæval merchant vessels, but also of the large sailing vessels which, after the invention of gunpowder, and the consequent necessity of carrying marine artillery, superseded the long low galleys propelled by oars. The battle of Actium gave the death-blow to the ancient type of vessel with its many banks of oars. The light Liburnian galleys which, though fully decked, were aphract, and, according to Lucan's testimony (bk. iii.),

Ordine contentæ gemino crevisse Liburnæ,

had only two banks of oars, were biremes. This apparently became the type of Roman war galleys; and, though the old name trireme survived, its meaning became simply "man of war," and did not any longer imply three banks of oars. Light vessels were in vogue, and galleys with single banks of oars are common in the representations on coins and in such frescos as survive, but trireme and quinquereme, etc., have vanished.

A cloud of obscurity rests on these, the dark ages of naval history. We know nothing of the character and composition of the fleet in which Ricimer defeated the Vandals in the 5th century of our era. Nor have we any details of the fleets of the Byzantine empire until the end of the 9th century, when a light is thrown upon the subject by the *Tactica* of the emperor Leo. This emperor, in giving his directions as to the constitution of his fleet, prescribes that dromones (*δρομώνες*) that is, trirenes—are to be got ready in the dockyards with a view to a naval engagement. The vessels are not to be too light or too heavy. They are to be armed with siphons for the projection of Greek fire. They are to have two banks of oars, with twenty-five rowers a-piece, on each side. Some of the vessels are to be large enough to carry two hundred men; others are to be smaller, like those called galleys or one-banked vessels, swift and light (*ἐλάττους δρομικωτάτους οἱόνει γαλαίας ἢ μονήρεις λεγομένους ταχινοὺς καὶ ἐλαφρούς*). Here we have the name galleys distinctively attached to vessels with one bank of oars. This passage should have saved much of the labor that has been thrown away in attempting to prove that the distribution of rowers in the mediæval galleys was upon the same principle as that observed in the ancient biremes or triremes.

The light thrown by the philosophic Byzantine on the naval construction and equipment of his time is but a passing flash. After the 9th century there is darkness again until the 11th and 12th centuries, when the features of the mediæval galley first begin to be visible. And here perhaps it is not out of place to say that it is necessary to distinguish between those imaginary representations of the antique in which painters, such as Tintoret, give fanciful arrangement to the oars of their galleys, so as to meet their ideas of bireme or trireme, from those that are historically faithful and figure, perhaps in an ungainly and inartistic manner, the galleys of Venice and Genoa as they appeared in the Middle Ages. It would exceed the space at our disposal here to enter into details which can be gathered from Jal's *Archéologie Navale* and the *Glossaire Nautique* of the same author, or the later works of Admiral Jurien de la Gravière and Admiral Fincati. It must suffice to indicate here a few of the main characteristics in which the mediæval galley differs from the ancient, and exhibits the last development of manpower as applied to motion in vessels larger than the boats of the present day.

These characteristics may be sketched briefly. Upon the mediæval galley, which was essentially a one-banked galley (*μονόκροτον*), the use of the longer oar or sweep took the place of the small paddling oars of the ancient vessel. The increased length of the oar requiring for its efficiency greater power than one man could employ led to the use of more than one man to an oar. The necessity therefore arose of placing the weight (or point at which the oar, used as a lever, worked against the thowl, and so pressed against the water, which is the fulcrum) at a greater distance from the force or man who moved the lever. This was gained by the invention of the apostis. Upon the hull of the mediæval galley was laid a frame-work which stood out on either side from it, giving on either side a strong external timber, running parallel to the axis of the vessel, in which the thowls were fixed against which the oars were rowed. It will be readily understood how this arrangement gave a greater length inboard for the oar as compared with that of the ancient vessels, where the thowl stood in the aperture of the vessel's side or port-hole. On the inner side, rising inwards towards the centre line of the decks and inclining upwards, were the banks or benches for the rowers, arranged *à la scaloccio*, who could each grasp the handle of the oar, moving forward as they depressed it for the feather, and backward for the stroke as they raised their hands for the immersion of the blade. The stroke no doubt was slower than that of the ancient galleys, but much more powerful. For the rest we must refer to the works above mentioned, where the reader will find minute descriptions of the build and the equipment of mediæval vessels, such as those which fought at Lepanto or carried the proud ensign of the Genoese republic.

SHIPBUILDING.

WITHIN the memory of the present generation shipbuilding, like many other arts, has lost dignity by the extended use of machinery and by the subdivision of labor. Forty years ago it was still a "mystery" and a "craft." The well-instructed shipbuilder had a store of experience on which he based his successful practice. He gained such advantages in the form and trim and rig of his vessels by small improvements, suggested by his own observation or by the traditions

The art of shipbuilding.

[1] Taking the interscalmium at 4 feet; but this does not agree with Vitruvius, who gives 2 cubits.

of his teachers, that men endeavored to imitate him, neither he nor they knowing the natural laws on which success depended. He had also a good eye for form, and knew how to put his materials together so as to avoid all irregularity of shape on the outer surfaces, and how to form the outlines and bounding curves of the ship so that the eye might be compelled to rest lovingly upon them. He was skilled also in the qualities of timber. He knew what was likely to be free from "rends" and "shakes" and "cups" which would cause leakage, and which would be liable to split when the bolts and treenails were driven through it. He knew what timber would bear the heat of tropical suns without undue shrinking, and how to improve its qualities by seasoning. He could foretell where and under what circumstances premature decay might be expected, and he could choose the material and adjust the surroundings so as to prevent it. He knew what wood was best able to endure rubbing and tearing on hard ground, and how it ought to be formed so that the ship might have a chance of getting off securely when she accidentally took the ground or got on shore. Such men were to be found on all the seacoasts of Europe and on the shores of the Atlantic in America.

A great change came over the art when steam was introduced. The old proportions and forms so well suited for the speeds of the ships and for the forces impressed upon them were ill adapted for propulsion by the paddle, and still less so for propulsion by the screw. Experience had to be slowly gained afresh, for the lamp of science burned dimly. It needed to be fed by results, by long records of successes and failures, before it was able to direct advancing feet. The further change from wood to iron and then to steel almost displaced the shipwright. Ships for commercial purposes may be said to be built now, so far as their external hulls are concerned, by draftsmen and boilermakers. The centres of the shipbuilding industry have changed. The ports where oaks (Italian, English, and Dantzic), pines from America and the north of Europe, teak from Moulmein, and elm from Canada were most accessible,—these marked the suitable places for shipbuilding. The Thames was alive with the industry from Northfleet to the Pool. It still lingers, but is slowly dying out. Travellers along the Mediterranean shores from Nice to Genoa mark the completeness of the change which a few years have made. The Tyne and the Clyde and the Mersey have become the principal centres of the trade. It has been drawn there because the iron and coal are near.

The science of naval construction.

But, while the art of shipbuilding has lost dignity, the science of naval construction has increased in importance. English art is of an eminently practical character. It is shy of experiment, as being costly in itself and likely to lead to delays and changes of system and of plant. It loves large orders and rapid production. It practices great subdivision of the details in order to cheapen production, and it stereotypes modes of work. There is no lack of boldness and enterprise; but the patient continuous inquiry and the slow but sure building up of theory upon research,—this is the exception. Naval construction in England has had the good fortune during the last quarter of a century to have not only a thriving industry but a home for research. Twenty-five years ago, when the high-pressure condensing engine was in its infancy, when shipbuilding steel was not, and armor-plated ships had not yet displaced the wooden line-of-battle ship, this home was founded. The Institution of Naval Architects may be fairly called the home for research in naval construction. It owes its establishment mainly to four well-known men—John Scott Russell, Dr. Joseph Woolley, Lord Hampton, for many years its honored president, and Sir Edward Reed, its first secretary. It has published every year a volume of *Transactions* recording the experience of all the shipbuilders and marine engineers in England. These *Transactions* contain also valuable contributions from French, Italian, German, and other eminent constructors and engineers.

Admiralty experiments on fluid resistance, etc.

Shortly after the foundation of the Institution one of its members, Mr. William Froude, set up an experimental establishment at Torquay, under the auspices and with the assistance of the Admiralty. The object was to submit to experiment various proportions and forms of ships in model in order to compare the relative resistances in the same model at various speeds, and in different forms and proportions at equal speeds. There was some reason to doubt the possibility of inferring from a model on a scale of $\frac{3}{4}$ of an inch to a foot what would happen in a ship of corresponding form and proportions. In order to establish satisfactorily the relations between the real and the model ship a series of experiments was desirable upon a real ship in which the resistances could be measured by a dynamometer at various speeds and compared with those indicated by the model. Up to the date of this trial the "scale of comparison" which had been employed by Mr. Froude was based upon *prima facie* theoretical truth, and it had some experimental justification. It may be stated as follows, as given by Mr. Froude in the volume for 1874 of the *Transactions* of the Institution of Naval Architects:

If a ship be D times the "dimension," as it is termed, of the model, and if at the speeds V_1, V_2, V_3 . . . the measured resistances of the model are R_1, R_2, R_3 . . . ., then for speeds $D^{\frac{1}{2}}V_1$, $D^{\frac{1}{2}}V_2 D^{\frac{1}{2}}V_3$, . . . of the ship, the resistances will be D^3R_1, D^3R_2 D^3R_3 . . . To the speeds of model and ship thus related it is convenient to apply the term "corresponding speeds." For example, suppose two similar ships, the length, breadth, depth, etc., of which were double one of the other. Then, if at a given speed (say 10 knots) the resistance of the smaller ship were ascertained, we may infer that at a speed of $\sqrt{2}\times 10 = 14.14$ knots in the larger ship there would be a resistance 8 times as great as in the smaller vessel.

This law is in accordance with the old rule that the resistance varies as the square of the velocity, and also as the area of the surface exposed to resistance. It takes into account both the resistance due to surface friction (subject to some correction) and the formation of deadwater eddies. The passage of the ship through the water creates waves which are dependent for their character upon the proportions and form of the ship. These constitute also an element of resistance. They are due to differences of hydrodynamic pressure inherent in the system of stream-lines which the passage of the ship creates. These wave-configurations should be precisely similar when the originating forms are similar and are travelling at speeds proportional to the square roots of their respective dimensions, because the resulting forces will be in that case as the square of the speeds. For example, if the surface of the water surrounding a ship 160 feet long, travelling at 10 knots an hour, were modelled together with the ship, on any scale, the model would equally represent, on half that scale the water surface surrounding a ship of similar form 320 feet long, travelling at 14.14 knots an hour; or again, on 16 times that scale, the water surface surrounding a model of the ship 10 feet long, travelling at $2\frac{1}{2}$ knots. Experiment has abundantly confirmed this proportion as to the similarity of waves caused by similar forms travelling at corresponding speeds. The resistance caused to these forms respectively by the development of the waves would, therefore, also be proportionate to the cubes of the dimensions of the forms and would follow the law of comparison stated above. It is necessary, however, to observe that, in dealing with surfaces having so great a disparity in length and speed as those of a model and of a ship, a very tangible correction is necessary in regard to surface friction.

The vessel tried by Mr. Froude for confirming the law of comparison was H.M.S. "Greyhound," of 1157 tons. She was towed by H.M.S. "Active," of 3078 tons, from the end of a boom 45 feet long, so as to avoid interferences of "wake." It was found to be possible to tow up to a speed of nearly 13 knots. The actual amount of towing strain for the "Greyhound" was approximately as follows: at 4 knots, 0.6 ton; at 6, 1.4 tons; at 8, 2.5 tons; at 10, 4.7 tons; and at 12 9.0 tons.

Comparing the indicated horse-power of the "Greyhound" when on her steam trials and the resistance of the ship as determined by the dynamometer, it appears that, making allowance for the slip of the screw, which is a legitimate expenditure of power, only about 45 per cent. of the power exerted by the steam is usefully employed in propelling the ship, and that the remainder is wasted in friction of engines and screw and in the detrimental reaction of the propeller on the stream lines of the water closing in around the stern of the vessel.

We may describe in Mr. Froude's own words the system of experiment now regularly carried out for the Admiralty, a system which has been successfully copied in other countries and also by a private shipbuilding firm, Messrs. Denny of Dumbarton:

"That system of experiments involves the construction of models of various forms (they are really fair-sized boats of from 10 to 25 feet in length), and the testing by a dynamometer of the resistances they experienced when running at various assigned appropriate speeds. The system may be described as that of determining the scale of resistance of a model of any given form, and from that the resistance of a ship of any given form, rather than as that of searching for the best form, and this method was preferred as the more general, and because the form which is best adapted to any given circumstances comes out incidentally from a comparison of the various results. We drive each model through the water at the successive assigned appropriate speeds by an extremely sensitive dynamometrical apparatus, which gives us in every case an accurate automatic record of the model's resistance, as well as a record of the speed. We thus obtain for each model a series of speeds and the corresponding resistances; and to render these results as intelligible as possible, we represent them graphically in each case in a form which we call the 'curve of the resistance' for the particular model. On a straight base line, which represents speed to scale we mark off the series of points denoting the several speeds employed in the experiments, and at each of these points we plant an ordinate which represents to scale the corresponding resistance. Through the points defined by these ordinates we draw a fair curved line, and this curve constitutes what I have called the curve of resistance. This curve, whatever be its features, expresses for the model of that particular form what is in fact and apart from all theory the law of its resistance in terms of its speed; and what we have to do is if possible to find a rational interpretation of the law. Now we can at once carry the interpretation a considerable way; for we know that the model has so many square feet of skin in its surface, and we know by independent experiments how much force it takes to draw a square foot of such skin through the water at each individual speed. The law is very nearly—and for present convenience we may speak as if it were exactly—that skin resistance is as the area simply, and as the square of the speed. Now, we have so many square feet of immersed skin in the model, and the total skin resistance is a certain known multiple of the product of that number of square feet and the square of the speed. Now, when we lay off on the curve of resistance a second curve which represents that essential and primary portion of the resistance, then we find this to be the result: the curve of skin resistance when drawn is found to be almost identical with the curve of total resistance at the lower speeds; but as the speed is increased the curve of total resistance is found to ascend more or less, and in some cases to ascend very much above the curve of skin resistance. The identity of the two curves at the lower speeds is the practical representation of a proposition which the highest mathematicians have long been aware of, and which I have lately endeavored to draw the public attention to, and to render popularly intelligible, namely, that when a ship of tolerably fine lines is moving at a moderate speed the whole resistance consists of surface friction. The old idea that the resistance of a ship consists essentially of the force employed in driving the water out of her way and closing it up behind her, or, as it has sometimes been expressed, in excavating a channel through the track of water which she traverses—this old idea has ceased to be tenable as a real proposition, though *prima facie* we know that it was an extremely natural one. We now know that, at small speeds, practically the whole resistance consists of surface friction, and some derivative effects of surface friction, namely, the formation of frictional eddies, which is due to the thickness of the stem and of the sternpost; but this collateral form of frictional action is insignificant in its amount unless the features of the ship in which it originates are so abruptly shaped as to constitute a departure from that necessary fineness of lines which I have described; and we do not attempt to take an exact separate account of it. Thus we divide the forces represented by the curve of resistance into two elements,—one 'skin resistance,' the other which only comes into existence as the speed is increased, and which we may term 'residuary resistance.' And we have next to seek for the cause and governing laws of this latter element. Now when the passage of the model along the surface of the water is carefully studied, we observe that the special additional circumstance which becomes apparent as the speed is increased is the train of waves which she puts in motion; and indeed it has long been known that this circumstance has important bearings on the growth of resistance. It is in fact certain that the constant formation of a given series involves the operation of a constant force, and the expenditure of a definite amount of power, depending on the magnitude of those waves and the speed of the model; and, as we thus naturally conclude that the excess of resistance beyond that due to the surface friction consists of the force employed in wave making, we in a rough way call that residuary resistance 'wave-making resistance.'

"Perhaps I had better say a few words more about the nature and character of these waves. The inevitably widening form of the ship at her 'entrance' throws off on each side a local oblique wave of greater or less size according to the speed and to the obtuseness of the wedge, and these waves form themselves into a series of diverging crests, such as we are all familiar with. These waves have peculiar properties. They retain their identical size for a very great distance with but little reduction in magnitude. But the main point is that they become at once dissociated from the model, and after becoming fully formed at the bow, they pass clear away into the distant water and produce no further effect on her resistance. But, besides those diverging waves, there is produced by the motion of the model another notable series of waves which carry their crests transversely to her line of motion. Those waves when carefully observed, prove to have the form shown in detail in Fig. 1. In the figure there is shown the form of a model which has a long parallel middle body accompanied by the series of these transverse waves as they appear at some one particular speed with the profile of the series defined against the side of the model; only I should mention that for the sake of distinctness the vertical scale of the waves has been made double the horizontal scale, so that they appear relatively to the model about twice as high as they really are. The profile is drawn from exact and careful measurements of the actual wave features as seen against the side of the model. It is seen that the wave is largest where its crest first appears at the bow, and it reappears again and and again as we proceed sternwards along the straight side of the model, but with successively reduced dimensions at each reappearance. That reduction arises thus: in proportion as each individual wave has been longer in existence, its outer end has spread itself farther into the undisturbed water on either side, and, as the total energies of the wave remain the same, the local energy is less and less, and the wave-crest, as viewed against the side of the ship, is constantly diminishing. We see the wave-crest is almost at right angles to the ship, but the outer end is slightly deflected sternward from the circumstance that when a wave is entering undisturbed water its progress is a little retarded and it has to deflect itself into an oblique position, so that its oblique progress shall enable it exactly to keep pace with the ship. The whole wave-making resistance is the resistance expended in generating, first the diverging bow waves, which, as we have seen, cease to act on the ship when once they have rolled clear of the bow; secondly, these transverse waves, the crests of which remain in contact with the ship's side; and thirdly, the terminal wave, which appears independently at the stern of the ship. This latter wave arises from causes similar to those which create the bow wave, namely, the pressure of the streams, which, forced into divergence then, here converge under the run

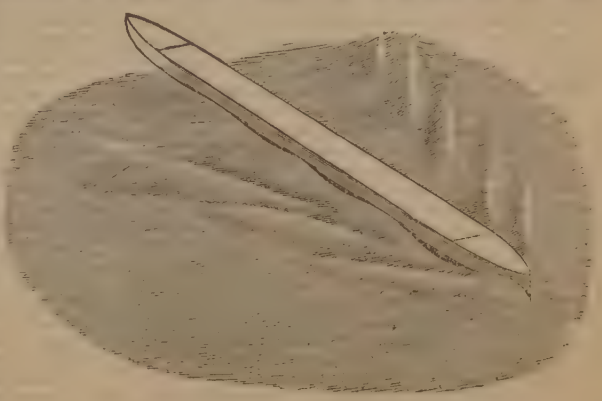

FIG. 1.

of the vessel, and reëstablish an excess of pressure at their meeting. The term 'wave-making resistance' represents, then, the excess of resistance beyond that due to surface friction, and that excess we know to be chiefly due to this formation of waves by the ship."

Pursuing these experiments it was found that not only was there a certain length of form necessary in a ship designed to attain a certain speed economically,—a fact which Mr. Scott Russell did much to establish,—but that there was also a considerable increase in wave-making resistance dependent upon the position of the after-body or run of the ship with reference to the wave-system left by the bow. Stating this again in Mr. Froude's words:

"The waves generated by the ship in passing through the water originate in the local differences of pressure caused in the surrounding water by the vessel passing through it; let us suppose, then, that the features of a particular form are such that these differences of pressure tend to produce a variation in the water level shaped just like a natural wave, or like portions of a natural wave of a certain length.

"Now an ocean wave of a certain length has a certain appropriate speed at which only it naturally travels, just as a pendulum of a certain length has a certain appropriate period of swing natural to it. And, just as a small force recurring at intervals corresponding to the natural period of swing of a pendulum will sustain a very large oscillation, so, when a ship is travelling at the speed naturally appropriate to the waves which its features tend to form, the stream line forces will sustain a very large wave. The result of this phenomenon is, that as a ship approaches this speed the waves become of exaggerated size, and run away with a proportionately exaggerated amount of power, causing corresponding resistance. This is the cause of that very disproportionate increase of resistance experienced with a small increase of speed when once a certain speed is reached.

"We thus see that the speed at which the rapid growth of resistance will commence is a speed somewhat less than that appropriate to the length of the wave which the ship tends to form. Now, the greater the length of a wave is the higher is the speed appropriate to it; therefore the greater the length of the waves which the ship tends to form the higher will be the speed at which the wave-making resistance begins to become formidable. We may therefore accept it as an approximate principle that the longer are the features of a ship which tend to make waves the higher will be the speed she will be able to go before she begins to experience great wave-making resistance, and the less will be her wave-making resistance at any given speed. This principle is the explanation of the extreme importance of having at least a certain length of form in a ship intended to attain a certain speed; for it is necessary, in order to avoid great wave-making resistance, that the 'wave features,' as we may term them, should be long in comparison with the length of the wave which would naturally travel at the speed intended for the ship.

"This view of the matter, then, recognizes the tendency of a ship, when the speed bears a certain relation to the length of her wave-making features, to make large waves and to incur corresponding wave-making resistance. But it does not take account of the possibility of the waves made by one feature of the form so placing themselves with reference to other features as, by the differences of pressure essential to their existence, either to cause an additional resistance, or on the other hand to cause a forward force which partly counterbalances the resistance originally due to their creation. The way in which this may occur we have seen strikingly exhibited in the results of the experiments I have been describing. We see that in the very long parallel-sided form the sternmost of the train of waves left by the bow has become so small that its effect on the stern is almost insensible; and here we find, consequently, the united resistance due simply to the generation of a separate wave-system by each end of the ship. As we gradually reduce the length of middle-body, the stern is brought within the reach of waves large enough to produce a sensible effect, and according as it is brought into conjunction with a crest or hollow, the total wave-making resistance becoming least of all (except at the very highest speed) when the middle-body is reduced to nothing."

The variations in residuary resistance due to these transverse wave-formations are variations of quasi-hydrostatic pressure against the after-body, corresponding with the changes in its position with reference to the phases of the train of waves, there being a comparative excess of pressure (causing a forward force or diminution of resistance) when the after-body is opposite a crest, and the reverse when it is opposite a trough.

It may be proper to introduce here some remarks as to the stream lines which have been referred to in the foregoing considerations. The statement of the case as given by Mr. Froude, and derived by him mainly from the investigations of Prof. Rankine, is as follows:

Stream lines.

"By a 'perfect fluid' is meant one the displacements of which are governed solely by the laws expressed in the equation of fluid motion, the particles of which therefore are without viscosity, and are capable of gliding rectilinearly along a perfectly smooth surface or past each other without frictional interference. By an imperfect fluid is meant one in which, as in water, as well as those with which we are practically acquainted, such frictional interference is inevitable.

"Dealing first, then, with the case of steady rectilinear motion in a perfect incompressible fluid, infinitely extended in all directions, it is plain that the motion will create differences of pressure, and therefore changes of velocity, in the particles of the surrounding fluid, which thus move in what are called 'stream lines.' At the commencement of the motion of the body the particles of the fluid undergo acceleration in their respective stream-line paths, and these accelerations imply a resistance experienced by the body; but after the motion has become established the differences of pressure satisfy themselves by keeping up the stream-line configuration; the energy which the particles receive from the body while they are being pushed aside by it along their stream-line paths is finally redelivered by them to it as they collapse around it, and come to rest after its passage, and the integrals of the + and — pressures on the body are exactly equal at every moment. The manner in which this is effected is governed by the general laws of fluid motion, as expressed by the well-known equations; and, since these equations contain no term which implies a loss of energy, the energy existing in the body, as well as in the stream-line system, remains unaltered; so that, if the motion is steady, or without acceleration or retardation, the body passes through this theoretically perfect fluid absolutely without resistance. Nor must it be thought a paradox (for it is unquestionable), that even a plane moving steadily at right angles to itself through a perfect fluid would in the manner described experience no resistance. But if the fluid, instead of being infinite in all directions, be bounded by a definite free surface parallel to the line of motion, such as a water level, the existence of this surface cuts off the reactions of all those particles which would have existed beyond the surface had the fluid been unlimited alike in all directions, and which would have given back in the manner described the energy imparted to them. By the absence of these reactions the stream-line motions which would have existed in the infinite fluid are modified, and the differences of pressure involve corresponding local elevations of the surface of the water in the vicinity of the moving body. And since, in consequence of the action of gravitation (the force which controls the surface), a water protuberance seeks immediately to disperse itself into the surrounding fluid in accordance with the laws of wave motion, the local elevation partly discharges itself along the surface by waves which carry with them the amount of energy embodied in their production. This energy is, in fact, part of the aggregate energy which was imparted to the particles of fluid while they were being pushed aside, and which, in the infinitely extended fluid would have been wholly restored to the body during their collapse after its passage, but is now, in fact, dissipated. The exact equality between the + and — pressures no longer exists, and the body experiences a definite resistance which it would not do if the fluid were infinite in all directions.

"It is clear, moreover, that the nearer the moving body approaches the surface the greater are the differences of pressure to be satisfied, the greater will be the waves formed, and the greater the dissipation of energy. Thus, for example, a fish will experience an increase of resistance as its path lies nearer to the surface, the train of waves it creates becoming then a visible accompaniment of its progress. *A fortiori*, when the body moves along the surface as a ship does on water, those differences of pressure which would exist during the motion if the fluid were infinite in all directions satisfy themselves in still larger waves, which, in fact, are the waves which accompany the body in its motion. The waves which thus visibly accompany a vessel *in transitu* form a marked phenomenon in river steaming. Thus we see how, although in a perfect fluid extended infinitely in all directions, a body, when once put in motion, would move absolutely without resistance, yet, when the fluid is bounded by a gravitating surface at or near the line of motion, the body will experience resistance by the formation of waves, notwithstanding that the fluid is a perfect one.

"If the fluid is again supposed to be infinite in all directions, but imperfect, the phenomena previously described undergo appropriate modifications, and the moving body

will also suffer a specific resistance,—in the first place by its having to overcome the friction and viscosity of those particles of the fluid with which it is in contact, and next because the friction of the surrounding particles *inter se* destroys that orderly arrangement of the stream-line configuration which allows of the energy imparted to the particles being returned without loss. If the supposed imperfect fluid is bounded by a free surface, as already described, and the body moves at or near this surface, it will experience resistances depending on fluid friction, almost exactly in the same manner as if the fluid were infinite in all directions. It will also experience very nearly the same resistance in virtue of the wave-making action as in the perfect fluid; and we here see the two sources of resistance existing independently of each other, and due to totally different causes."

Stability.

Important as the question is as to the effect of form upon resistance, that of its effect upon stability or steadiness at sea is even more so. Before the use of steam for the propulsion of ships the speed which could be attained in seagoing ships by sail power was largely a question of stability or power to carry a large spread of canvas without inclining or "heeling" too greatly. Small differences in the form of the transverse sections of the ship in the region of the load water-line and under water were influential in this respect, and naval constructors occupied themselves greatly with such questions. The form of the problem completely changes when the propelling power is no longer an upsetting force. The important questions in steamships are the proportions of length, breadth, and depth; the form of "entrance" and "run"; the construction of propelling machinery within the ship; and the proportions, form, and number of revolutions of the propeller. But, while this is so, the effect of the stability of the steamship upon her behavior at sea, as a question of rolling or "laboring," remains very great. There are, moreover, a very large number of seagoing ships still dependent upon sails for their propulsion, and the question of sailing power is very important in vessels employed on our coasts for commerce and for pleasure. The latest and most complete investigation of questions of stability is to be found in Sir Edward J. Reed's recently published work, *The Stability of Ships*. There is a more popular exposition of the subject by Mr. W. H. White, director of naval construction, in his *Manual of Naval Architecture* (1877, 2d ed. 1882), of which use has been made in the following pages.

A ship floating freely and at rest in still water displaces a volume of water exactly equal in weight to her own weight. The circumstances of the water in which she floats are in fact the same whether the cavity made in the water by the ship is filled by the ship as in Fig. 2, or by a volume of water

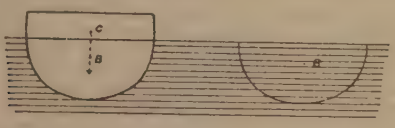

FIG. 2. FIG. 3.

having the same weight as the ship (Fig. 3). When the ship occupies the cavity the whole of her weight may be supposed to be concentrated at her centre of gravity, G, Fig. 2, and to act vertically downwards. When the cavity is filled with water its weight, called in relation to the ship the "displacement," may be supposed to be concentrated at B, Fig. 3, which is the centre of gravity of the "displacement" or of the displaced water. This centre of gravity is usually known in relation to the ship as the "centre of buoyancy." The weight of this water may be supposed to be concentrated at B, and to act vertically downwards. As this water would remain in the cavity at rest, its downward pressure must be balanced by equal upward pressures, that is by the buoyancy of the surrounding water. These upward pressures must act in the same way as if there were a single pressure equal and opposite to the weight of the water, and acting through the "centre of buoyancy." In Fig. 2 a ship is represented floating freely and at rest in still water. Her total weight may be supposed to act vertically downwards through the centre of gravity G, and the buoyancy vertically upwards through the centre of buoyancy. The second condition which the ship floating freely and at rest in still water will always satisfy is therefore said to be that her centre of gravity will lie in the same vertical line with the centre of gravity of the volume of water which she displaces. So long as the ship rests under the action of these opposing and balanced forces the line joining the centres B and G is vertical and represents the common line of action of the weight and buoyancy. There are of course horizontal fluid pressures acting upon her, but these are balanced among themselves.

The ship may be floating at rest, but under constraint, and not freely. There may be the pressure of wind on the sails, or the strain of a rope holding her in a position of rest although the centres B and G are no longer in the same vertical line. Fig. 4 represents such a case. The vessel is

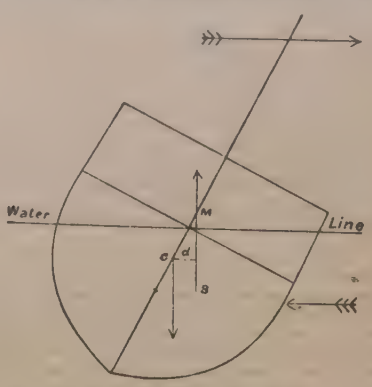

FIG. 4.

at rest, but there is some external force operating other than that of buoyancy; and the equal and opposite forces of the weight and buoyancy act in different vertical lines, and no longer balance each other. They form a mechanical "couple," tending to move the ship from the position of constrained rest in which she is shown. If W represents the total weight of the ship (in tons), and d the perpendicular distance between the parallel lines of action of the weight and buoyancy (in feet), then the operative moment of the "couple" is represented by the product of the two quantities W and d, measured in foot-tons. If the constraint is removed, and the vessel is freed from all external forces save those of the fluid in which she floats, she will move under the operation of the "couple" towards the upright position until the consequent alteration in the form of the cavity of the displacement brings the centre of buoyancy into the same vertical with the centre of gravity of the ship. What has been illustrated by reference to transverse inclination of the ship is equally true of oblique or longitudinal inclinations. If the position of the weights in the ship remains unaltered under such changes of inclination the centre of gravity remains unaltered. In all calculations it has to be assumed that the centre of gravity is a fixed point in the ship, and that movable weights will be secured in the ship. With this assumption the position of the centre of gravity of a ship can be correctly assigned by calculation, small disturbances caused by movements of men, etc., not being large enough to be appreciable.

The statical stability of a ship may be defined as the effort which she makes when inclined steadily by external forces to overcome the constraint and return to the position in which she floats freely, at or near the upright. This effort, as already explained, depends upon the position of the centre of buoyancy B, or the distance from the vertical line through G which the altered form of the cavity of the displacement has caused it to assume. It may always be measured by the product of the two quantities W (in tons) and d (in feet) (see Fig. 4). This product in foot-tons is known as the "moment of statical stability" for the particular angle of inclination and corresponding position of B which are assumed. A little reflection will show that when large angles of inclination are reached the centre B ceases to recede from the vertical through the centre of gravity of the ship, but will, as the inclination increases, approach this vertical line, and eventually pass to the other side of it.

The moment of statical stability is at its maximum when the distance d is greatest. The angle which the ship has reached when the centre B has reached this point is called the "angle of maximum stability." As the centre B travels backwards from this position with the increasing inclination of the ship the distance d decreases and the righting power of the ship decreases proportionately. When B passes the vertical line through G the moment of stability changes its character and becomes an upsetting force, which will continue to act until the ship reaches a new position of rest, usually bottom upwards. The angle which the ship reaches before this change takes place, *i.e.*, when B passes to the other side of the vertical line through G, is called the "angle of vanishing stability" and it indicates the ship's "range of stability." The change may occur at very small angles

if the ship is crank and her sides are low in the water. It may not and sometimes does not occur, on the other hand, until the ship is lying on her beam ends.

If a curve is plotted out showing these positions and indicating also how d first increases and then decreases as the ship is inclined more and more from the upright, the curve is known as the curve of stability. A "stiff ship" is one which opposes great resistance to inclination from the

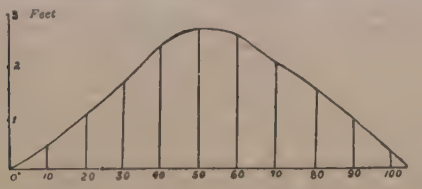

FIG. 5.—Curve of stability of a high-sided ship, having small metacentric height. The vertical line to left shows the various lengths of d, and the horizontal line the angles of inclination (in degrees).

upright when under sail or acted upon by external forces. A "crank ship" is one very easily inclined, the sea being supposed to be smooth and still. A "steady ship" is one which when exposed to the action of waves keeps nearly upright. Crank ships are usually the steadiest ships. Changes in the height of the point of intersection M (Fig. 4) above the centre of gravity indicate corresponding changes in the stiffness of a ship. Speaking generally, the stiffness of the ship may be considered to vary with the height of M above G. The line BM does not cut GM in the same point at considerable inclinations as it does at a very small inclination. The point of intersection at the smallest conceivable inclination receives a definite name. It is known as the metacentre, and the distance GM is in this condition called the metacentric height. See HYDROMECHANICS.

The following table contains particulars of the metacentric heights of different kinds of vessels of war, and the corresponding time of an oscillation in still water:

Names of Ships.	Metacentric Height.	Period of a Double Roll.
	Feet.	Seconds.
H.M.S. "Sultan"	2.5	8.9
H.M.S. "Inconstant"	2.8	8.0
H.M.S. "Devastation"	3 7	6.76
American monitor (shallow draft)	14.0	2.7
"Inflexible" when rolled in still water in Suda Bay	7.65	10.7

Generally speaking, decrease in metacentric height is accompanied by a lengthening of the period of an oscillation. The ship swings more slowly as she loses stiffness.

Oscillations.

There is no sensible difference in the time occupied by a ship in a swing or roll from side to side, whether she rolls through only three or four degrees on either side of the upright or twelve or fifteen degrees. For larger angles there would be small differences.

The tables which have been given show some remarkable changes in the stability conditions in ships of war within recent years. Sailing ships were formerly made with so little deviation from existing types that it was not found to be necessary to ascertain their exact measure of stability or to lay down rules for regulating it. The position of the centre of gravity was modified by ballast, and as much as nine or ten per cent. of the displacement was allowed for this. Heavy rolling and great uneasiness of ship from excessive stability had often to be endured. In other cases crankness or inability to carry sail had to be accepted. When armored ships were first introduced they had about the same metacentric height (6 feet) as is to be found in the earlier sailing frigates. The "Normandie" in the French navy and the "Prince Consort" in the English navy had from 6 to 7 feet, and they were exceedingly uneasy and deep-rolling ships. It was soon discovered that a reduction in metacentric height would cure this evil. The later ships in both navies were accordingly designed to have a metacentric height of about 3 feet. The "Magenta" had 3½ feet and the "Hercules" 3 feet. This change altered the period during which the ship made a double oscillation, i.e., from starboard back to starboard, to 14 to 16 seconds instead of from 10 to 11 seconds, as it had been in the "Normandie" and "Prince Consort." The effect on the behavior of the ship in a seaway was most remarkable. These ships with small metacentric height might be put into the trough of a sea, and as the waves crossed them they steadily rose and fell, hardly inclining their masts. The effect on gunnery practice was also valuable, but there is always a peril attending steadiness obtained by such means: vessels having small metacentric height require careful handling under sail or they may be overset and lost. There is another defect in this system, viz., that wounds in action will cause the ship to incline sooner and more considerably, and they become more dangerous than they would be in a stiffer ship. Bilge-keels and water-chambers are now employed in the English navy, together with, and as opposing influences to, much greater metacentric height. These devices were introduced into the "Inflexible" in order to counteract the influence of a metacentric height of 8 feet which was designedly given to her. They have proved very effective, but there is another feature in this vessel which has tended to prevent uneasiness and heavy rolling. The time of an oscillation or quickness of rolling, depends not only upon the metacentric height but upon the moment of inertia about a longitudinal axis. The time of an oscillation from starboard to starboard may be written thus:

$$2T = 1.1\sqrt{K^2/m},$$

where T is the ship's period in seconds for a single roll, m is the metacentric height, or height of metacentre above the centre of gravity in feet, and K is the radius of gyration in feet. The moment of inertia is increased by widening the ship, putting heavy armor on her sides, and placing the turrets and guns out towards the sides of the ship. It was seen that these features in the "Inflexible," which were elements in her design, would favor her and tend to counteract the great metacentric height. The event has shown that, while a metacentric height of 6 feet in the "Normandie" gave 10 seconds to 11 seconds period, 8 feet in the "Inflexible" only gives 11 seconds as a period, corresponding with a radius of gyration of 28 feet. The feeling expressed that "in order to provide against the impossible contingency of the loss of stability by complete waterlogging of the ends we had made an intolerable ship" was not justified. The ship is now so stiff that when the ends are waterlogged the running in and out of all her guns on one side only inclines her 2½ degrees, while in the "Monarch" when intact and light the same operation inclines the ship 5 degrees.

Resistance to oscillation.

The resistance offered by the water to the rolling of the ship consists of three parts: (1) that due to the rubbing of the water against the bottom of the ship as she rolls; (2) that due to the flat surfaces which are carried through the water, such as outside keels and deadwood; (3) the creation of waves by the rolling ship to replace those which move away from the ship. The creation of these surface waves expends energy and checks the motion of the ship which makes the creative effort.

Bilge-keels.

Mr. White, giving briefly the results of some of the experiments of Mr. Froude made for the Admiralty, says: "Experiments have been made by Mr. Froude to show how rapidly the rate of extinction may be increased by deepening bilge-keels. A model of the 'Devastation' was used for this purpose, and fitted with bilge-keels, which, on the full-sized ships, would represent the various depths given in the following table. The model was one thirty-sixth of the full size of the ship, and was weighted so as to float at the proper waterline, to have its centre of gravity in the same relative position as that of the ship, and to oscillate in a period proportional to the period of the ship. In smooth water it was heeled to an angle of 8½ degrees, and was then set free, and allowed to oscillate until it came practically to rest, the number of oscillations, and their period being observed. The following results were obtained:

Model fitted with	Number of Double Rolls before Model was practically at rest.	Period of Double Roll.
		Seconds.
No bilge-pieces	31½	1.77
A single 21-inch bilge-keel on each side	12½	1.9
" 36-inch " "	8	1.9
Two 36 inch " "	5¾	1.92
A single 72-inch " "	4	1.99

"Not content with obtaining the aggregate value of the resistances for ships, Mr. Froude has separated them into their component parts, assigning values to frictional and keel resistances as well as to surface disturbance. In doing so, he has been led to the conclusion that surface disturbance is by far the most important part of the resistance offered to rolling, as the following figures given by him for a few ships will show:

Ships.	Frictional.	Keel, Bilge-keel and Deadwood	Total Resistance.	Surface Disturbance.
Sultan.....	354	5,036	20,000	14,610
Inconstant...	140	4,060	21,500	17,300
Volage	96	2,944	14,100	11,060
Greyhound..	120	700	4,700	3,880

"Frictional and bilge-keel resistances in this table have been obtained by calculation from the drawings of the ship, Mr. Froude making use of data as to coefficients for friction and for head resistance which he had previously obtained by independent experiments, and which may therefore be regarded as leading to thoroughly trustworthy results. It will be noticed that in no case does the sum of the frictional and keel resistances much exceed one-fourth of the total resistance, while it is much less than one-fourth in other cases. The consequence is that surface disturbance must be credited with the contribution of three-fourths or thereabouts of the total resistance, a result which could scarcely have been predicted. Waves are constantly being created as the vessel rolls, and as constantly moving away, and the mechanical work done in this way reacts in a reduction of the amplitude of successive oscillations. Very low waves, so low as to be almost imperceptible, owing to their great length in proportion to their height, would suffice to account even for this large proportionate effect. For example, Mr. Froude estimates that a wave 320 feet long and only 1¼ inches in height would fully account for all the work credited to surface disturbance in the fourth case in the preceding table.

"Another important deduction from the figures in the table is the large proportionate effect of 'keel' resistance as compared with frictional resistance, thus establishing the advantages of deep bilge-keels. Ships of the Royal Navy recently constructed have been furnished with much deeper bilge-keels than were formerly in use, but a limit to the depths that can be fitted is often reached, because of the necessity for compliance with certain conditions and extreme dimensions, in order that the vessels may be able to enter existing docks."

Water chambers.

In the Royal Navy advantage has also been taken of the power of loose water within a ship to quell motion. It was first employed in the "Inflexible" in a part of the ship lying above the bomb-proof deck, and at the level of the water-line. Its use resulted from a discussion, when the "Inflexible" was designed, of the probable effect of water entering this region of the ship through shot holes. The matter has since been thoroughly established by experiment, and affords a new and valuable means of preventing heavy rolling in ships having large initial stability. There is now no hesitation in giving a metacentric height of 6 feet, and obtaining all the security against upsetting which this ensures, because it is felt that the violent rolling formerly inseparable from stiffness can be prevented. The investigation into this matter has been conducted by Mr. Philip Watts, Mr. R. E. Froude, and Mr. W. E. Smith, acting for the Admiralty.

The accompanying memorandum, prepared by the present writer in 1884, gives the general results:

"In investigating the phenomena attending the use of water as a means of quelling the motion of ships, Mr. Froude has not only taken advantage of the experiments made in the 'Edinburgh' by running men across the decks, but he has also studied similar phenomena in a model water-chamber, mounted, not on a model of a ship, but on a large pendulum weighted to the required 'period,' the relative level of the model chamber and the axis of rotation being made to correspond approximately to scale with that in the ship.

"The conclusions, stated in the form of a comparison between the quelling effects of bilge-keels and of moving water, are as follows: (1) There is a certain depth of water in the chamber which gives the maximum effect; this is dependent upon the width of the chamber and the period of the ship. (2) With this depth of water the growth of resistance to rolling commences almost at zero of angle, whereas with either a greater or less depth there is practically no resistance at all due to the water up to a certain angle, which angle increases with increase of departure from the proper depth. (3) At larger angles of roll the disadvantage of departure from the proper depth of water is not marked. (4) The resistance of water in a chamber does not increase at all uniformly with increase of angle of roll, but increases rapidly at first and at the larger angles becomes more nearly constant for all angles. (5) The best quantity of water for the original chamber in the 'Edinburgh' was 43 tons; the best for the chamber enlarged by removal of cork walls was 79 tons; and the best for the chamber extending to the sides of the ship would be 100 tons. The first-named extension improved the resistance at 10° by 21 per cent., and the further extension by another 22 per cent.

"As compared with bilge-keels, the matter is stated as follows: while 2 feet addition to the breadth of the bilge-keels adds in round numbers two-thirds to the existing extinguishing power of hull and bilge-keels on the 'Edinburgh' at all angles of rolling, the fully extended water-chamber adds at 3° of roll about six times, and at 5° about three times that power; at 12° the chamber adds no more than 2 feet of bilge-keel, while at 18° it only adds half as much. It is therefore evident that, while both are valuable, the water-chamber is for most kinds of service much the more valuable of the two.

"Explaining the cause of the phenomena, Mr. Froude says:

"'The extinguishing or quelling effect of water depends, of course, *cæteris paribus*, upon the value of the moment represented by the transference of water from side to side, *i.e.*, with a given quantity of water, upon the distance moved by its centre of gravity. This distance increases with increase of angle of roll, and consequently the extinction similarly increases up to a certain point, where we appear to have approximately reached the maximum possible transference of water, and consequently the maximum extinction of which the quantity of water is capable with the dimensions of the chamber. This point occurs generally at a moderate angle, and above this angle the extinction becomes practically constant. But the extinguishing effect of the water of course largely depends also upon the timing of its motion from side to side,—the extinction being greatest when that motion takes place most nearly at the time of extreme angle of ship, *i.e.*, in such a manner as that the water may be as much as possible running downhill when it is moving across, and as much as possible upon the rising side of the ship when it is stationary. If, on the other hand, the motion of the water across were to take place when the ship is quite upright, the extinction would be *nil*. It is therefore conceivable that for the same total degree of motion or transference of water we may have a very different degree of extinction, according to the timing of that motion. In the motion of the water energy is necessarily wasted, and it is clear that, if we are dealing with a permanent condition of things, *i.e.*, if the ship is being steadily maintained at a constant angle of roll, this waste of energy in each run of water from side to side must be exactly equal to the energy taken out of the ship in each swing by the extinction. The motion of the water may be and generally is of a type very wasteful of energy, the water either rushing across in a mass, and consuming its energy by breaking with great violence against the opposite side, as it does at the larger angles of rolling, or, at more moderate angles, running across in a breaking wave or bore, which consumes its energy as it goes in its own internal resistance; and under these circumstances the timing of the motion appears invariably to approach pretty nearly to that giving the maximum extinction for the degree of motion. But the motion of the water sometimes takes the form of a mere alternating slope of surface, or tidal swing from side to side, and here there is very little waste of energy, the energy of motion of the flow of water in one direction being converted into potential energy in the shape of rise of water at the side, and then given out again to the water flowing back to the other side, and so on. The waste of energy in this form of motion being almost *nil*, the timing is almost exactly that appropriate to *no* extinction, the water being in the middle of its passage across and the surface being level when the ship is upright.'

"The value of the chamber of course increases as its length in the direction of the keel of the ship increases. The actual size of the chamber we adopted appears to give valuable results, although its extent was necessarily limited."

In some lectures recently delivered Mr. Smith, assistant constructor of the navy, illustrated the use of water in quelling motion by models as shown below.

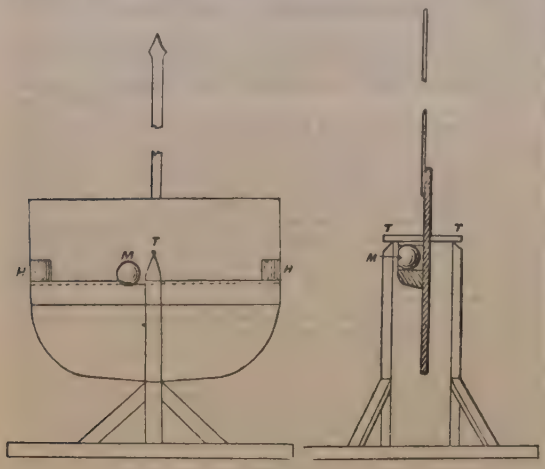

FIG. 6.

"The models represented the midship sections of the 'Admiral' class, and were both of the same weight and size. Each model was mounted on trunnions, marked T, and both oscillated freely on these trunnions in exactly the same time. The models were placed one behind the other, so that the parallelism of the masts was evident to the audience. The model in Fig. 7 was provided with a glass tube into which varying quantities of water could be put. An amount of water representing $\frac{1}{10}$ of the total weight of the model, *i.e.*, 100 tons in a 10,000-ton ship, was now placed in the tube, the models were started from the same angle as before, and the model with the loose water, instead of keeping up exactly with the other, or rolling more violently, came almost instantaneously to rest.

"The tube was filled with varying quantities of water, and the effect was always to stop the model much sooner than the model with no weights free to move. The two models were always started from the same angle, so that their relative behavior could be easily seen. When the tube was quite full there was practically no effect. The two models rolled almost together. The same effect resulted from the motion of a marble representing in weight 100 tons in a ship of 10,000 tons. The same reduction must always occur in a rolling ship if we have a loose weight of any kind, whether the weight be water or a gun. If this reduction did not take place we should have something to explain which would be quite inexplicable. For suppose we have two ships alike in all respects as regards size, shape, weight, time of oscillation, etc., and situated on precisely the same seas, but one having all her weights properly secured, and the other with a weight capable of traversing the deck every time the ship rolls. If the two vessels were to roll to exactly the same extent we should have the sea not only rolling the ship with the loose weight to the same extent as the ship with all her weights fixed, but the sea would, in addition, be doing all the work involved in the traversing of the heavy weight across the deck, which is quite impossible under the circumstances of perfect similarity we have supposed. The sea can only do the same work on both. In the one case that work consists entirely in rolling the vessel, in the other it consists partly of rolling the ship and partly in dashing the weight about. The rolling in the latter must therefore inevitably be less than in the former case."

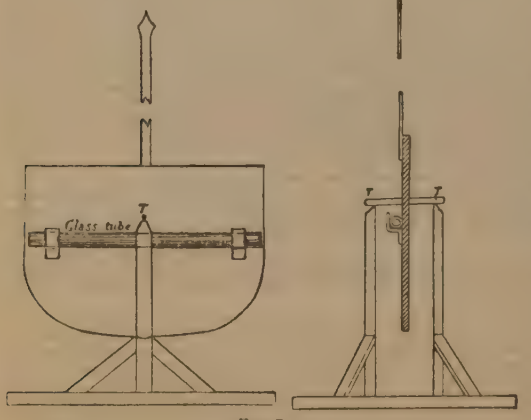

FIG. 7.

Dynamical stability is the "work" done or energy expended in heeling the ship from the upright to any inclined position. The unit of "work" employed in measuring dynamical stability is a foot-ton. When the vessel is gradually inclined the forces inclining her must do work depending upon the amount of the statical stability at the successive instantaneous inclinations passed through, and these are given by the curve of stability already described. Dynamical stability is of value as a means of comparing the resistance of ships to upsetting under the action of suddenly applied forces, such as squalls of wind. Illustrating this Mr. White says: Dynamical stability.

"Roughly speaking, it may be said that a force of wind which, steadily and continuously applied, will heel a ship of ordinary form to a certain angle will, if it strikes her suddenly when she is upright, drive her over to about twice that inclination, or in some cases further still. A parallel case is that of a spiral spring; if a weight be suddenly brought to bear upon it, the extension will be about twice as great as that to which the same weight hanging steadily will stretch the spring. The explanation is simple. When the whole weight is suddenly brought to bear upon the spring, the resistance which the spring can offer at each instant, up to the time when its extension supplies a force equal to the weight, is always less than the weight; and this unbalanced force stores up work which carries the weight onwards, and about doubles the extension of the spring corresponding to that weight when at rest.

Structure.

The changes which have come about in materials and modes of construction within the last 50 years have been most remarkable. The first steamer built expressly for regular voyages between Europe and America was not built until 1837. Dr. Lardner stated at about this date: "We have an extreme limit of a steamer's practicable voyage, without receiving a relay of coals, a run of about 2000 miles." The "Great Western," built by Patterson of Bristol and engined by Maudslay of London under the superintendence of Sir I. K. Brunel, was the first such ship, and she was launched July 19, 1837. She was 212 feet long between the perpendiculars, 35 feet 4 inches broad, and had a displacement of 2300 tons. She was propelled by paddles. Iron vessels were built early in the present century for canal service, then for river service, and later for packet service on the coasts. In about the year 1838 iron vessels of small dimensions were built for ocean service. The largest iron vessel built up to 1841 was less than 200 feet long. In 1843 we get for the first time the ocean-going steamship in its present form, built of iron, and propelled by the screw. This was the "Great Britain," 286 feet long, projected and designed by Brunel. Time has abundantly justified these bold enterprises on the part of Brunel, which he had to carry through in the face of great opposition. He entered with equal boldness on another innovation in 1850, viz., the use of very large dimensions on the ground of economy of power. It was not until 1852 that he had the opportunity to put these views forward in a way to satisfy him. The different sizes of vessels discussed before the design was finally settled for the "Great Eastern" were as follows: Great Western. Great Britain. Great Eastern.

No.	Length.	Breadth.	Midship Section.	Draught.
1	663	79.9	1646	24
2	634	76.39	1640	25
3	609	73.5	1639	26
4	730	87	2090	28

The dimensions eventually settled were—length, 680 feet; beam, 83 feet; mean draught, about 25 feet; screw engine, indicated horse-power, 4000, and nominal horse-power, 1600; paddle, indicated horse power, 2600, and nominal horse-power, 1000; to work with steam 15 lb to 25 lb; speed of screw, 45 to 55 revolutions; paddle, 10 to 12.

The "Great Eastern," produced by the joint skill of Brunel and Scott Russell, remains in advance of present practice, although she has served as a model for the best of it. Her great size rendered it possible to give to her an amount of security against fatal injury to her hull which cannot be attained in smaller ships. It is a mistake to suppose that large ships are less secure than small ones. The

large ship can receive without inconvenience a wound which would be fatal to a small one, and the possibilities of obtaining high speed increase with the size. Had a higher speed been aimed at in the "Great Eastern," it might have altered the whole current of her history, and changed also the history of shipbuilding itself.

Bulk-heads.

The question of bulkheads, on which Brunel insisted so much in this ship, is one which underlies all questions of construction. If the number of bulkheads in ships were increased as they ought to be, the numbers and sizes of the ribs or frames of the ship would be modified, and the system of construction generally would be changed, and become more like that of the "Great Eastern." The question is therefore one which justifies some further consideration, so that it may be popularly understood.

Iron ships are commonly made with less than half their bulk out of water. If water enters such a ship, and the amount which enters does not exceed in bulk that portion of the bulk of the ship which is out of the water, *and which will, when immersed, exclude the water*, then the ship, if she does not turn over, will still float. If, however, the inflow cannot be stopped, but continues, the ship soon sinks.

Let us suppose the case of a ship 50 feet long, 10 feet wide, and 10 feet deep, divided into five equal parts by four watertight partitions, and floating in water with half its bulk immersed (Fig. 8). Suppose now that a hole is made

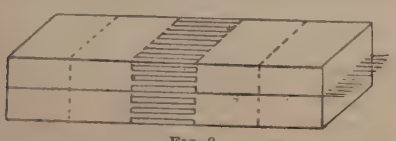

FIG. 8.

in the middle of this ship under the water, so that water can flow freely in, then the part of the ship which is shaded ceases to have floating power. The water in this shaded place is no longer displaced, but is admitted, and if the ship is to continue afloat, the other parts of the ship must displace water to the amount by which this shaded part has ceased to do so. As it is one-fifth of the whole immersed bulk which is lost, the remaining four compartments must sink, so as each to support one-fourth of the whole, instead of one-fifth, as before; *i. e.*, the draught of water, or immersion of the whole ship, will be increased, and the ship will, if she has stability enough to keep upright, finally float at rest again at this deeper immersion. The water will rise in the centre compartment to the level of the water outside, and will then cease to flow in. The additional immersion will be only one and a quarter feet, but in an ordinary ship, divided into compartments of equal length, there would be a greater increase of immersion by the injury of a centre compartment, because the end compartments are narrow, and must sink deeper in order to bear their share of the burden imposed by the loss of the buoyancy of the centre division.

Or it may be other than a central compartment which is damaged, and in that case the ship tips, and finds a new floating line, with the end towards which the damaged division lies depressed more than the other end.

If it should happen that the divisional partitions, or bulkheads as they are called, rise only a few inches above the water level which the ship floats at when undamaged, then, on the occurrence of a bad leak filling one compartment, the tops of the bulkheads are brought, by the increased immersion of the ship, beneath the water-level, the water will rise through the hatches, or openings in the deck, in the damaged compartment, will flow over the entire deck, and the ship will be lost, either by the filling of other compartments by the water passing down into them, or by the capsizing of the ship. This latter event will generally happen, although only one compartment is full, if the sea has free access to the deck from end to end of the ship, and it becomes wholly immersed.

In 1866 the president of the Institution of Naval Architects said: "The circumstances of the sad event of the loss of the 'London,' accompanied as it was by the simultaneous loss of another ship of still larger size, and of a higher reputed character" (the "Amalia"), "was, I think, an event so remarkable that I should be very sorry indeed if this annual meeting of this Institution were to pass by without some notice being taken of the extraordinary circumstances of the loss of that ship, and without some discussion upon what we suppose to be the causes of the loss, and the faults, if any, of the construction of those ships." "The passengers who pass to and fro are not judges of the question; they can take no precaution for their own safety; it is to the skill and science of those who build these ships that the passenger trusts, and to the care which the legislature and the Government are bound to take of their fellow-subjects."

Subsequently the council of the Institution arrived at the following conclusions and offered them as recommendations to shipbuilders and shipowners:

Recommendations of the Council of the Institution of Naval Architects.

"1. No general rule can be safely laid down for regulating the proportions of length and depth to the breadth of a ship, and a great variety of proportions of length and depth to breadth may be safely adopted, and the ship made sound and seaworthy, by judicious form, construction, and lading.

"2. The construction load-water-line of every ship, and her scale of displacement from light to load-water-line, should be appended to every design of a ship, showing the extreme draught to which she should be laden; and measures should be taken to insure that this information be recorded on the ship's papers. It is desirable also that along with a ship's papers, in the possession of the captain, there should always be carried a scale of displacement, a sail draft, and a set of outline plans of the ship, comprising a longitudinal section, and at least four cross sections of the ship. On these plans should be marked the capacity, in tons of 40 cubic feet, of each compartment of the hold. The surplus buoyancy of each compartment up to the load-water-line, or its power to carry deadweight, should be given in tons deadweight. These papers should always accompany the ship's register, and a copy of them should be lodged in the custom house of the port from which the ship hails.

"3. There is a minimum height of freeboard which cannot be safely reduced in sea-going ships of ordinary fitment; and it is desirable to fix this minimum height. Freeboard should be understood to be the vertical height of the upper surface of the upper deck (not spar deck) at the side, amidships, above the load-water-line. The proportion of freeboard should increase with the length. One-eighth of the beam is a minimum freeboard for ordinary sea-going ships of not more than five breadths to the length, and $\frac{1}{12}$ of the beam should further be added to the freeboard for each additional breadth in the length of the ship; this would give:

For a ship of 32 feet beam and 160 feet long, 4 feet freeboard;
For a length of 192 feet, 5 feet freeboard;
For a length of 224 feet, 6 feet freeboard;
For a length of 256 feet, 7 feet freeboard;—the beam remaining the same.

But, as the addition of a spar-deck on long vessels may be considered an equivalent or substitute for the increased freeboard required for extra length, a complete spar-deck would leave the freeboard of these extra lengths at the original height of 4 feet.

"4. It is not considered desirable to offer any recommendations with regard to poops and forecastles. It must depend entirely upon the professional judgment of the designer of a ship, whether, looking to her proportions, form, and purpose, the additions of poop and forecastle are expedient and safe. In general, where poops and forecastles are adopted, they should be closed and seaworthy, but their weight may be inexpedient in long fine ships; and there are cases where a light top-gallant forecastle (*i.e.*, an open forecastle raised above the level of the upper deck) may be useful in keeping heavy seas out of the ship. In general, spar-decks in long ships are preferable to poop and forecastle, and no diminution of freeboard should be allowed for a poop or forecastle.

"5. It would add much to the strength and security of steamships if transverse and longitudinal bulkheads, coal bunkers, iron lower decks, and screw alley were all so connected with the hull of the ship and with each other as to form independent cellular compartments, watertight, and having all their communications with the decks and each other by watertight doors worked from the deck. In proportioning the compartments of a ship (and especially of ships devoted to passengers) it is very desirable so to arrange them that if any *two* adjacent compartments be filled, or placed in free communication with the sea, the remaining compartments will float the ship. It is considered that no iron passenger ship is well constructed unless her compartments be so proportioned that she would float safely were any one of them to fill with water, or be placed in free communication with the sea. Double bottoms are to be regarded as a great element, both of safety and strength, in the structure of a large iron ship.

"6. It is very desirable that sufficient ventilation should always be provided in passenger ships to admit of closing all side scuttles and battening down, or otherwise inclosing, all hatches in bad weather.

"7. In regard to hatchways and openings in the deck no limits can be set to their size; but it is desirable to carry the beams of the ship across them without interruption wherever practicable; they may also be made removable where required, being replaced on going to sea. All coamings over engine and boiler rooms in passenger ships should be as high as practicable, of iron, and riveted to the beams and carlings. Openings in the deck may be fitted with solid coverings, hinged in place so as to be readily closed.

"8. It being considered that all openings in the sides or ends of vessels are subject to accidents that endanger the safety of ships, it is desirable that the side and stern windows should, in addition to the glass lights, have *hinged dead-lights*, with a view to their being always in place, and that all cargo ports should be strongly secured by iron cross bars.

"9. It is believed that all openings from and communications with the sea from engine-room and pipes should be protected by conical, or Kingston, or sluice valves, and similar precautions should be taken for all openings through the bottom of the ship, where damage to pipes or ship would admit water into the holds.

"10. It is considered that all steam vessels, if of iron, should have a brass-barrelled hand-pump to every compartment except the forward and after ones (the former to have a sluice cock), or that, as a substitute for these pumps, there should be patent

pumps having independent connections to this extent. They should also have a donkey engine and pump capable of pumping from the bilge and from the sea, of feeding the boilers, and of throwing water on deck. All vessels should have one or more bilge-pumps, worked by the large engines, with bilge injection pipes if the engines have condensers. In large vessels the donkey engines should have a separate boiler high above the water-line, and also communication with the main boilers. All vessels should have a set of bilge pipes connecting every hold and the engine compartments with these pumps. As a security against fire there should be pumps on the upper deck, fitted as force pumps, and provided with a sufficient length of hose (with the necessary copper delivery jets) to reach either extremity of the vessel, and also provided with suction hose or pipes from the sea. The cocks by which the working of the pumps is regulated should be carefully arranged and marked, and great care should be taken that both cocks and pipes are accessible. A plan of the whole should accompany the ship's papers, and the crew should be periodically exercised in their use.

"11. The stowage of a ship, whether done by contract or not, should be done under inspection of the captain of the ship, and should be conducted under his own orders only; and he alone should be held responsible for the good stowage of his ship. Ships are often very badly stowed, the weights being sometimes too low, thus causing them to roll with such rapid and violent motions as to carry away the spars, and otherwise endanger the safety of the ship, and at other times too high thus making the ships crank, and liable to turn over. A ship may, however, generally, whatever her form, be so stowed as to avoid both dangers. As the character of the ship in these respects varies, so does the number of oscillations she would make per minute if she were set rolling in still water, by men running across her deck, or other means, and then allowed to come to rest; that is, if the ship be crank the number of oscillations per minute will be few, and if she be too stiff they will be numerous; but, under the same conditions of stowage, the number will always be very nearly the same, whatever the amount of the impulse to set her rolling may be. Although this peculiarity has long been known to scientific men, no such observations have been made in merchant ships as would justify any specific rule on the subject. It is, however, most desirable that information should be collected upon it, and that the attention of the owners and captains of vessels should be called to it.

"12. It is believed that the present rules of the Board of Trade regarding boats, life-boats, and their tackle are good in principle. The responsibility of keeping all boats in constant readiness and efficiency obviously rests on the captain, and must fix on him the blame for all neglect and its consequences. Every open boat built of iron or steel should be fitted with sufficient watertight spaces to float her.

"13. The system of proportioning anchors and cables by Lloyd's, and of proving under license of the Board of Trade by Act of Parliament is so far satisfactory; but, as the proof-test alone cannot establish the excellence of the cable, the reputation of the makers must be relied upon.

"14. In order to provide for the rapid clearance of the upper deck from water which may break over the ship, flap-boards should be fitted to the lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water.

"15. Water-closets on decks below or near the water-line, may be the means of gradually and imperceptibly flooding the ship, and endangering her safety, unless the pipes and valves are strong and are carefully fitted."

It is in the directions indicated in these recommendations that the honesty and skilfulness of the modern builder of steam and sailing ships of war come into play, and some judgment may be formed by the general public of the character of the ship by inquiring into matters upon which the council thought it necessary to make such recommendations. The guarantee which the public have of the fitness of passenger ships for service, as a question of proper construction and state of efficiency, is the survey and certificates of the Board of Trade. The law runs thus:

Board of Trade surveys.

The owner of every steam vessel constructed or intended to carry passengers (except vessels which fall within the definition of foreign-going ships contained in the Mercantile Marine Act, 1850, and are employed in the conveyance of the royal public mails or despatches under contract with and under the superintendence of the lord high admiral or the commissioners for executing the office of lord high admiral) shall cause such steam vessel to be surveyed twice at least in every year, at the times hereinafter directed, by a shipwright surveyor and an engineer surveyor appointed for the purposes of this Act by the lords of the said committee, such shipwright surveyor in the case of an iron steam vessel being a person properly qualified to survey iron steam vessels, and shall obtain a declaration of the sufficiency and good condition of the hull of such steamer, and of the boats and other equipments thereof, required by this Act; and also, if the lords of the said committee so require, a statement of the number of passengers (whether deck passengers or other passengers) which such vessel is constructed to carry, under the hand of such shipwright surveyor, and a declaration of the sufficiency and good condition of the machinery of such steamer under the hand of such engineer surveyor; and in such declarations it shall be distinguished whether such vessel is in construction and equipments adapted for sea service as well as for river or lake service, or for river or lake service only; such declaration shall state the local limits within which such vessel is, in the judgment of the surveyor, adapted for plying; and in the case of sea-going vessels the declaration of one of the surveyors shall contain a statement that he is satisfied that the compasses have been properly examined and adjusted; and such owner shall transmit such declaration to the lords of the said committee within fourteen days after the dates thereof respectively.

As to the fifth recommendation of the council of the Institution of Naval Architects, it must be observed that there is at present no law relating to the subdivision of steamships. There was a clause (No. 300) in the Merchant Shipping Act of 1854, which was virtually a reproduction of clause 20 of the Steam Navigation Act of 1851, and which read as follows:

"1. Every steamship built of iron of 100 tons or upwards, the building of which commenced after the 28th day of August, 1846, and every steamship built of iron of less burden than 100 tons, the building of which commenced after the 7th August, 1851 (except ships used solely as steam tugs), shall be divided by substantial transverse watertight partitions, so that the fore part of the ship shall be separated from the engine-room by one of such partitions, and so that the after part of such ship shall be separated from the engine-room by another of such partitions.

"2. Every steamship built of iron, the building of which commences after the passing of this Act, shall be divided by such partitions as aforesaid into not less than three equal parts, or as nearly so as circumstances permit.

"3. In such last-mentioned ships each such partition as aforesaid shall be of equal strength with the side plates of the ship with which it is in contact.

"4. Every screw steamship built of iron, the building of which commences after the passing of this Act, shall, in addition to the above partitions, be fitted with a small watertight compartment inclosing the after extremity of the shaft."

The above law was repealed by the Act dated 29th July, 1862, and on the 28th August, 1863, the Admiralty applied to the Board of Trade to know whether the Board of Trade officers were empowered under any circumstances to insist on iron vessels having watertight compartments when employed in conveyance of mails and passengers, observing that the Admiralty were still of opinion that the regulations in force prior to the Amendment Act of 1862 in respect of contract packets should not have been relaxed. They considered such vessels should have compartments so arranged that if any one of them became filled with water the loss of buoyancy thereby occasioned should not endanger the safety of the ships, as recommended by them in their communication of the 17th December, 1860. To this the Board of Trade replied (3d September, 1863) that their surveyors no longer had any power to require given watertight partitions to be fitted in passenger steamships—though they agreed with the Admiralty in thinking that steam vessels carrying passengers and mails should be provided with a sufficient number of watertight partitions,—and had no reason to suppose that the Admiralty would not insist on such partitions being fitted in all steamships employed in conveyance of mails. They further say that the enactments in the Act of 1854 were repealed, not because of any doubts as to the necessity of proper and sufficient watertight partitions, but because those enactments which required only two of such partitions for all sizes and classes of ships had become practically useless or mischievous. It was found that in large vessels more partitions than the Act required were necessary to secure the safety of the ship, and it was thought better to leave builders and designers unfettered in providing extra strength and security to meet the various forms, sizes, and descriptions of ships than to tie them down by general statutory regulations which could not be so framed as to meet the varying wants and circumstances of the shipbuilding trade.

In a return by the Board of Trade to the House of Commons, dated 11th August, 1875, setting forth the instructions issued to their surveyors under the Merchant Shipping Acts, 1854 to 1873, clause 26 reads:

"Surveyors should not refuse to grant a declaration for a vessel solely on the ground that bulkheads are not fitted, that the ordinary bulkheads are not watertight, or that the bulkheads fitted are otherwise defective, unless they are of opinion that the want of, or the defective state of, the bulkheads renders the ship unseaworthy, in which case they are fully justified in refusing to grant a declaration. They should, in all cases in which they refuse to grant a declaration for a vessel in consequence of defects relative to bulkheads, forward to the Board of Trade a full statement of their reasons for thinking that those defects render the hull of the vessel unseaworthy. Collision watertight bulkheads, at least, must be fitted in all seagoing steamers. The surveyors are also to see that an after watertight compartment is fitted to cover the stern-tube of the screw-shaft, both in old and in new vessels."

This regulation has been reissued in the latest instructions to Board of Trade surveyors, dated 1884.

Inefficient subdivision of iron and steel ships.

It thus comes about that the number of bulkheads forming watertight compartments, the number of doors in them, and how they are fastened, are made the subject of consideration by the Board of Trade at their inspections; but the fact is that the great majority of ocean-going steamers are not divided into watertight compartments in any efficient manner, and many losses in collision, grounding, and swamping are due to this. Although all steamships have some bulkheads, and some have many bulkheads, they are

as a rule distributed in such a way, or are so stopped below the water-level, that for flotation purposes after perforation those lying between the foremost collision bulkhead and the after bulkhead through which the screw-shaft passes are practically useless.

With the exception of some four hundred ships, there are no iron steamships afloat which would continue to float were a hole made in the bottom plating anywhere abaft the collision bulkhead and outside the engine-room, or which would not founder were water admitted through breaches made by the sea in weak superstructures and deck openings. Of the four hundred ships referred to as having properly designed bulkheads two hundred are essentially cargo-carriers. They are generally built with five subdivisions, the machinery space being one. *Iron sailing ships are without exception undivided into compartments.* They have by law a collision bulkhead near the bow, and that is all. Between June, 1881, and February, 1883, there were about one hundred and twenty iron steamships lost, of speeds of nine to twelve knots, not one of which was well constructed according to the opinion of the council of the Institution of Naval Architects.

It may be said that wooden ships were not divided into watertight compartments, but it must be remembered that in a wooden ship there is far more local resistance to a blow either in collision or by grounding, and that a wooden ship takes a much longer time to settle down in the water and sink. Also, when wood was employed for passenger and trading ships speeds were much lower and traffic and risks of collision very much less.

The shipbuilding registries prescribe rules for the government of the builder who desires to have their certificate, and these rules have been so carefully framed and so honestly enforced that English-built ships are as a rule well and solidly constructed. The recent (8th June, 1882) rule of the London Lloyd's register as to the important subject of division into compartments is as follows, and it may be hoped that it will be effective:

"Screw-propelled vessels, in addition to the engine room bulkheads, to have a watertight bulkhead built at a reasonable distance from each end of the vessel. In steamers 280 feet long and above an additional bulkhead is to be fitted in the main hold, extending to the main or upper deck, about midway between the collision and engine-room bulkheads; and in steamers of 330 feet long and above an additional bulkhead is to be fitted in the afterhold, extending to the same height."

"The foremost or collision bulkhead in all cases to extend from the floor plates to the upper deck. . . . The engine-room bulkheads to extend from the floor plates to the upper deck in vessels with one, two, or three decks, and to the main deck in spar- and awning-decked vessels. The aftermost bulkhead will be required to extend to the upper deck unless the arrangement of bulkheads be submitted to and approved by the committee. . . . In sailing vessels the foremost or collision bulkhead only will be required."

It is not intended by the foregoing remarks, serious as they are, to blot the splendid record of shipbuilding achievement in Great Britain during the last twenty years. The shipowners, shipbuilders, marine engineers, Lloyd's surveyors, and the Board of Trade have all shared in a development of shipping which, in amount and in general efficiency, is not only without parallel in the history of the world, but, as it still appears to us who have witnessed it, almost incredible. It still is to be regretted that expansion has been thought of and sought more ardently than greater security and efficiency. The men who have studied to improve their structural arrangements because of their love of true and good work, and with no prospect of recognition or reward, have been comparatively very few.

Strains to which ships are subject.

There is, perhaps, no structure exposed to a greater variety of strains than a ship, and none in which greater risks of life and property are incurred. A thorough practical knowledge of the disturbing forces in action either to injure or destroy the several combinations embraced in its structure is therefore most important. Some of these forces always act, whether the ship be at rest or in motion. She may be at rest floating in still water, and will be at rest if cast on shore; and, when there, she may be resting on her keel as a continuous bearing, with a support from a portion of her side, or she may be supported in the middle only, with both ends for a greater or less length of her body left wholly unsupported, or she may be resting on the ends with the middle unsupported, or under any other modification of these circumstances; and under all these the strains will vary in their direction and in their intensity.

If the ship be in motion the same disturbing forces may still be in action, with others in addition which are produced by a state of motion. When a ship is at rest in still water, although the upward pressure of the water upon its body is equal to the total weight of the ship, it does not necessarily follow that the weight of every portion of the vessel will be equal to the upward pressure of that portion of the water directly beneath it, and acting upon it; on the contrary, the shape of the body is such that their weights and pressures are very unequal.

If the vessel be supposed to be divided into a number of laminæ of equal thickness, and all perpendicular to the vertical longitudinal section, it is evident that the after laminæ comprised in the overhanging stern above water, and the fore laminæ comprised in the projecting head also above water, cannot be supported by any upward pressure from the fluid, but their weight must be wholly sustained by their connection with the supported parts of the ship. The laminæ towards each extremity immediately contiguous to these can evidently derive only a very small portion of their support from the water, whilst towards the middle of the ship's length a greater proportionate bulk is immersed, and the upward pressure of the water is increased.

A ship floating at rest under the view just taken of the relative displacement of different portions of the body, if the weights on board are not distributed so that the different laminæ may be supported by the upward pressure beneath then as equally as possible, may be supposed to be in the position of a beam supported at two points in its length at some distance from the centre, and with an excess of weight at each extremity. At sea it would be exposed to the same strain; and if supported on two waves whose crests were so far apart that they left the centre and ends comparatively unsupported, the degree of this strain would be much increased. The more these two points of support approach each other, or if they come so near each other that the vessel may be looked upon as supported on one wave, or on one point only in the middle of her length, the greater will be the tensile strain on the upper portion, and the crushing strain on the lower portion of the fabric of the ship. A vessel whose weights and displacements are so disposed as to render her subject to a strain of this kind beyond what the strength of her upper works will enable her to bear, will tend to assume a curved form.

The centre may curve upwards by the excess of the pressure beneath it, and the ends drop, producing what is called "hogging." The main remedy for these evils is in the strength of the deck and upperworks, and their power to resist a tensile strain. There is seldom a want of sufficient strength in the lower parts of the vessel to resist the crushing or compressing force to which it is subjected. The decks of vessels should not, therefore, be too much cut up by broad hatchways; and care should be taken to preserve entire as many strakes of the deck as possible. The tensile strength of iron can be brought to bear most beneficially in this respect.

Though these are the strains to which a ship is most likely to be exposed, it by no means follows that there are no circumstances under which strains of the directly opposite tendency, when pitching, or otherwise, may be brought by recoil to act upon the parts. The weights themselves in the centre of the ship may be so great that they may have a tendency to give a hollow curvature to the form, and it is therefore equally necessary to guard against this evil. When this occurs, the vessel is technically said to be "sagged," in distinction to the contrary or opposite change of form by being hogged. The weight of machinery in a wooden steam-vessel, or the weight or undue setting up of the main-mast, will sometimes produce sagging. The introduction of additional keelsons tended to lessen this evil, by giving great additional strength to the bottom, enabling it to resist extension, to which, under such circumstances, it became liable; and, as the strain upon the deck and upperworks becomes changed at the same time, they are then called upon to resist compression.

When the ship is on a wind, the lee-side is subjected to a series of shocks from the waves, the violence of which may be imagined from the effects they sometimes produce in destroying the bulwarks, tearing away the channels, etc. The lee-side is also subjected to an excess of hydrostatic pressure over that upon the weather side, resulting from the accumulation of the waves as they rise against the obstruction offered to their free passage. These forces tend in part to produce lateral curvature. When in this inclined position, the forces which tend to produce hogging when she is upright also contribute to produce this lateral curvature.

The strain from the tension of the rigging on the weather side when the ship is much inclined is so great as frequently to cause working in the topsides, and sometimes even to break the timbers on which the channels are placed. Additional strength ought therefore to be given to the sides of the ship at this place; and, in order to keep them apart, the beams ought to be increased in strength in comparison with the beams at other parts of the ship.

The foregoing are the principal disturbing forces to which the fabric of a ship is subjected; and it must be borne in

mind that some of these are in almost constant activity to destroy the connection between the several parts. Whenever any motion or working is produced by their operation between two parts, which ought to be united in a fixed or firm manner, the evil will soon increase, because the disruption of the close connection between these parts admits an increased momentum in their action on each other, and the destruction proceeds with an accelerated progression. This is soon followed by the admission of damp, and the unavoidable accumulation of dirt, and these then generate fermentation and decay. To make a ship strong, therefore, is at the same time to make her durable, both in reference to the wear and tear of service and the decay of materials. It is evident from the foregoing remarks that the disturbing influences which cause "hogging" are in constant operation from the moment of launching the ship. As this curvature can only take place by the compression of the materials composing the lower parts of the ship and the extension of those composing the upper parts, the importance of preparing these separate parts with an especial view to withstand the forces to which they are each to be subjected cannot be overrated by the practical builder.

Curves of strains.

In his *Manual of Naval Architecture*, Mr. W. H. White gives illustrations of the still-water strains upon two armored ships in the British navy, the "Minotaur" and the "Devastation."

H. M. S. "Minotaur."

In these diagrams the curves B represent the distribution of the buoyancy. The ordinates of the curve are proportionate to the displacement of adjacent transverse sections of the ships. The curves W represent the distribution of the weight of the ships and their lading. The curves L repre-

FIG. 9.

sent the excesses and defects of buoyancy obtained from the two curves B and W and set off from a new base line. The excess of buoyancy above the line is exactly equal to

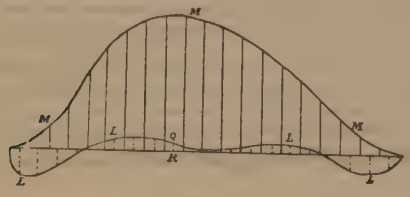

FIG. 10.

the defect of buoyancy below it. The curves M indicate the bending moments. The ordinates of the curve lying above the base are obtained by summing all the moments, whether upwards or downwards, about the point in the length of the ship where the ordinate is taken. It may happen,

H. M. S. "Devastation."

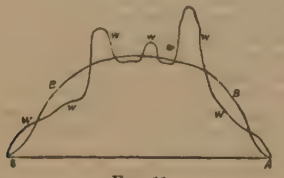

FIG. 11.

as in the case of the "Devastation," that the moments will tend to cause hogging for a portion of the length and will

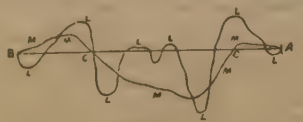

FIG. 12.

then change their character, and at other portions of the length will tend to cause sagging. Where the curve M crosses the base line there is no strain of either hogging or sagging tending to bend the ship there. In the "Minotaur" there is a hogging tendency throughout. The amount at the midship section is very great, being represented by the moment 4.5 feet × 10,690 tons. After Sir Edward Reed left the Admiralty he strongly expressed his fears that this strain was too considerable for safety in the "Minotaur" and "Agincourt."

Designing.

The principal plans of a ship are the "sheer" plan, giving in outline the longitudinal elevation of the ship; the "body" plan, giving the shape of the vertical transverse sections; and the "half-breadth" plan, giving the projections of transverse longitudinal sections. In addition to these the builder is furnished by the designer with elevations, plans, and sections of the interior parts of the ship, and of the framing and plating or planking.

The thicknesses or weights of all the component parts are specified in a detailed specification, in order that the ship when completed may have the precise weight and position of centre of gravity contemplated by the designer. In the case of ships built for the British navy all the building materials are carefully weighed by an agent of the designer before they are put into place by the builder. As each section of the work is completed, the weight is compared with the designer's estimate in the designing office. As soon as the incomplete hull is floated the actual displacement is measured, and compared with the weights recorded as having gone into the ship. It is also the practice in the Royal Navy to calculate the position of the centre of gravity of the incomplete hull, and its draught of water before it is floated, in order to avoid all risk of upsetting from deficiency in stability at that stage of construction. The ship is usually found to float in precise accordance with the estimate. When completed ships float at a deeper draught than was intended, or are found to be more or less stable than was wished, this is nearly always due to additions and alterations made after the completion of the design. Where the designer is at liberty to complete the ship in accordance with the original intention there ought to be precise correspondence between the design and the ship.

In designing a ship of novel type the designer has to pass all the building details through his mind and assign them their just weights and proportions and positions. Every plate and angle bar and plank, every bar and rod and casting and forging, and every article of equipment has to be conceived in detail and its effect estimated.

Building.

Laying off.

The term "laying off" is applied to the operation of transferring to the mould loft floor those designs and general proportions of a ship which have been drawn on paper, and from which all the preliminary calculations have been made and the form decided. The lines of the ship, and exact representations of many of the parts of which it is to be composed, are to be delineated there to their full size, or the actual or real dimensions, in order that moulds or skeleton outlines may be made from them for the guidance of the workmen.

Fore- and after-bodies.

A ship is generally spoken of as divided into fore and after bodies, and these combined constitute the whole of the ship; they are supposed to be separated by an imaginary athwartship section at the widest part of the ship, called the midship section or deadflat. The midship body is a term applied to an indefinite length of the middle part of a ship longitudinally, including a portion of the fore-body and of the after-body. It is not necessarily parallel or of the same form for its whole length.

Those portions of a wooden ship which are termed the square and cant bodies may be considered as subdivisions of the fore-bodies and after-bodies. There is a square fore-body and a square after-body towards the middle of the ship, and a cant fore-body, and a cant after-body at the two ends. In the square body the sides of the frames are square to the line of the keel, and are athwartship vertical planes. In the cant bodies the sides of the frames are not square to the line of the keel, but are inclined aft in the fore-body and forward in the after-body. The reason for the frames in these portions of a wooden ship being canted is that, in these parts of the ship, the timber would be too much cut away on account of the fineness of the angle formed between an athwartship plane and the outline or water-line of the ship. The timber is therefore turned partially round till the outside face coincides nearly with the desired outline, and it is by this movement that the side of a frame in the cant fore-body is made to point aft, and in the cant after-body is made to point forward.

In wooden ships the term "timbers" is sometimes applied to the frames only, but more generally to all large pieces of timber used in the construction. Timbers, when combined together to form an athwartship outline of the body of a ship, are technically called frames, and sometimes ribs.

Timbers.

The keel, in the United Kingdom at least, is generally made of elm, on account of its toughness, and from its not being liable to split if the ship should take the ground, though pierced in all directions by the numerous fastenings passing through it. It is generally composed of as long pieces as can be obtained, united to each other by horizontal scarfs. The rabbet of the keel is an angular recess cut into the side to receive the edge of the planks on each side of it. The keel is connected forward to the stem by a scarf, sometimes called the boxing scarf, and aft to the stern-post by mortise and tenon. The apron is fayed or fitted to the after-side of the stem, and is intended to give shift to its scarfs. the lower end scarfs to the deadwood. The keelson is an internal line of timbers fayed upon the inside of the floors directly over the keel, the floors being thus confined between it and the keel. Its use is to secure the frames and to give shift to the scarfs of the keel, and thus give strength to the ship to resist extension lengthways, and to prevent her hogging or sagging. The foremost end of the keelson scarfs to the stemson, which is intended to give shift to the scarfs connecting the stem and keel. The frames or ribs are composed of the strongest and most durable timber obtainable.

Keel.

The floors in the Government service were carried across the keel with a short and long arm on either side alternately, so as to break joint, and between the frames the space was filled in solid.

Floors.

upon it is sometimes dowelled into it. These dowels, therefore, connect it with the shelf and the waterway, and through this means it is thus connected with the sides of the ship.

From the short outline previously given of the disturbing forces acting on the ship it will be seen that the strain on the ends of the beams to destroy their connection with the side and loosen the fastenings must be very great when the ship is under sail, either on a wind or before it—that is, either inclined or rolling. The principal action of these forces is to alter the vertical angle made by the beam and the ship's side—that is to raise or depress the beam, and so alter the angle between it and the side of the ship above or below it. On the lee-side the weight of the weather side of the ship and all connected with it, and of the decks and everything upon them, as well as the upward pressure of the water, all tend to diminish the angle made by the beam and the ship's side below it, and consequently increase the angle made between them above it. The contrary effect is produced on the weather side, where the tendency is to close the angle above the beam and open that below it. If the beam, when subjected to these strains, be considered as a lever, it will be evident that the fastenings to prevent its rising ought to be as far from the side as is consistent with the convenience or accommodation of the ship, and that, while the support should also be extended inwards, the fastening to keep down the beam-end should be as close to the end of the beam, and consequently to the ship's side, as it can be placed.

The plank, or skin, or sheathing of a ship, both external and internal, is of various thicknesses. A strake of planking is a range of planks abutting against each other, and generally extending the whole length of the ship. A thick strake, or a combination of several thick

Planking.

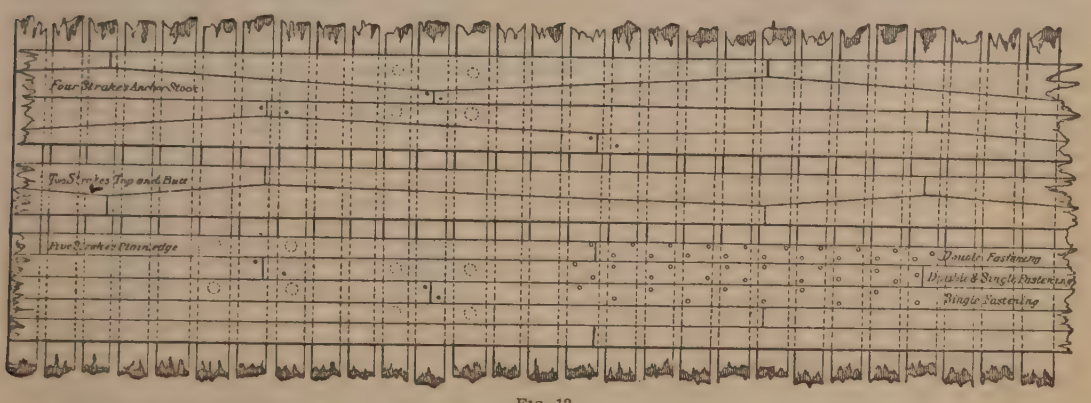

FIG. 13.

Longitudinal pieces of timber are worked round the interior of a ship for the purpose of receiving the ends of the beams of the several decks; they are called shelves, and are of the greatest importance, not only for this purpose, but also as longitudinal ties and struts.

Shelves.

The beams of a ship prevent the sides from collapsing, and at the same time carry the decks. The beams are spaced, and their scantling settled upon according to the strength required to be given to the decks, and to suit the positions of the masts and hatchways, and other arrangements connected with the economy of the ship. All beams have a curve upwards towards the middle of the ship, called the round-up. This is for the purpose of strength, and for the convenience of the run of the water to the scuppers. Wooden beams are single piece, two, three, or four piece beams according to the number of pieces of timber of which they are composed. The several pieces are scarfed together, and dowelled and bolted, the scarfs being always vertical.

Beams.

The connection of the ends of the beams to the sides of the ship has been made in various ways. The points to be considered with reference to this connection, are—that the beam is required to act as a shore or strut, to prevent the sides of the ship from collapsing, and also as a tie to prevent their falling apart, that the beam shall not rise from its seat, and that it shall not work in a fore-and-aft direction.

That the beam may be an effective shore, nothing more is necessary than that the abutment of the end against the ship's side may be perfect. In order that it may act as a tie between the two sides, it is generally dowelled to the upper surface of the shelf on which it rests; and the under surface of the waterway plank which lies

Waterways.

strakes, is worked wherever it is supposed that the frame requires particular support—for instance, internally over the heads and heels of the timbers, both externally and internally in men-of-war vessels between the ranges of ports, and internally to support the connection of the beams with the sides and at the same time form a longitudinal tie. The upper strakes of plank, or assemblages of external planks, are called the sheer-strakes. The strakes between the several ranges of ports, beginning from under the upper-deck ports of a three-deck ship in the British navy, were called the channel wale, the middle wale, and the main wale. The strake immediately above the main wale was called the black strake. The strakes below the main wale diminished from the thickness of the main wale to the thickness of the plank of the bottom, and were therefore called the diminishing strakes. The lowest strake of the plank of the bottom, the edge of which fits into the rabbet of the keel, is called the garboard strake.

Plank is either worked in parallel strakes, when it is called "straight-edged," or in combination of two strakes, so that alternate seams are parallel. There are two methods of working these combinations, one of which is called "anchor stock," and the other "top and butt." The difference will be best shown by Fig. 13. The difference in the intention is that in the method of working two strakes anchor-stock fashion, the narrowest part of one strake always occurs opposite to the widest part of the other strake, and consequently the least possible sudden interruption of longitudinal fibre, arising from the abutment, is obtained. This description, therefore, of planking is used where strength is especially desirable. In top and butt strakes the intention is, by having a wide end and a narrow end in each plank, to approximate to the growth of the tree, and

to diminish the difficulty of procuring the plank. When the planking is looked upon as a longitudinal tie, the advantage of these edges being, as it were, imbedded into each other is apparent, all elongation by one edge sliding upon the other being thus prevented. The shift of plank is the manner of arranging the butts of the several strakes. In the ships of the British navy the butts were not allowed to occur in the same vertical line, or on the same timber without the intervention of three whole strakes between them.

Of the internal planking the lowest strake, or combination of strakes, in the hold, is called the limber-strake. A limber is a passage for water, of which there is one throughout the length of the ship, on each side of the keelson, in order that any leakage may find its way to the pumps.

The whole of the plank in the hold is called the ceiling. Those strakes which come over the heads and heels of the timbers are worked thicker than the general thickness of the ceiling, and are distinguished as the thick strakes over the several heads. The strakes under the ends of the beams of the different decks in a man-of-war, and down to the ports of the deck below, if there were any ports, were called the clamps of the particular decks to the beams of which they are the support—as the gun-deck clamps, the middle-deck clamps, etc. The strakes which work up to the sills of the ports of the several decks were called the spirketting of those decks—as gun-deck spirketting, upper-deck spirketting, etc.

Fastening.

The fastening of the plank is either "single," by which is meant one fastening only in each strake as it passes each timber or frame; or it may be "double," that is, with two fastenings into each frame which it crosses; or, again, the fastenings may be "double and single," meaning that the fastenings are double and single alternately in the frames as they cross them. The fastenings of planks consist generally either of nails or treenails, excepting at the butts, which are secured by bolts. Several other bolts ought to be driven in each shift of plank as additional security. Bolts which are required to pass through the timbers as securities to the shelf, waterway, knees, etc., should be taken advantage of to supply the place of the regular fastening of the plank, not only for the sake of economy, but also for the sake of avoiding unnecessarily wounding the timbers.

Decks.

The decks of a wooden ship must not be considered merely as platforms, but must be regarded as performing an important part towards the general strength of the whole fabric. They are generally laid in a longitudinal direction only, and are then useful as a tie to resist extension, or as a strut to resist compression. The outer strakes of decks at the sides of the ship are generally of hard wood, and of greater thickness than the deck itself; they are called the waterway planks, and are sometimes dowelled to the upper surface of each beam. Their rigidity and strength is of great importance, and great attention should be paid to them, and care taken that their scarfs are well secured by through-bolts, and that there is a proper shift between their scarfs and the scarfs of the shelf.

When the decks are considered as a tie, the importance of keeping as many strakes as possible entire for the whole length of the ship must be evident; and a continuous strake of iron or steel plates beneath the decks is of great value in this respect. The straighter the deck, or the less the sheer or upward curvature at the ends that may be given to it, the less liable will it be to any alteration of length, and the stronger will it be. The ends of the different planks forming one strake were made to butt on one beam, and, as the fastenings are driven close to the ends, they did not possess much strength to resist being torn out. The shifts of the butts, therefore, of the different strakes required great attention, because the transference of the longitudinal strength of the deck from one plank to another was thus made by means of the fastenings to the beams, the strakes not being united to each other sideways. The introduction of iron decks or partial decks under the wood has modified this.

Caulking.

These fastenings have also to withstand the strain during the process of caulking, which has a tendency to force the planks sideways from the seam; and, as the edges of planks of hard wood will be less crushed or compressed than those of soft wood when acted on by the caulking-iron, the strain to open the seam between them to receive the caulking will be greater than with planks of softer wood, and will require more secure fastenings to resist it. It may also be remarked that the quantity of fastenings should increase with the thickness of the plank which is to be secured, for the set of the oakum in caulking will have the greater mechanical effect the thicker the edge.

When the planks are fastened, the seams or the intervals between the edges of the strakes are filled with oakum, and this is beaten in or caulked with such care and force that the oakum, while undisturbed, is almost as hard as the plank itself. If the openings of the seam were of equal widths throughout their depth between the planks, it would be impossible to make the caulking sufficiently compact to resist the water. At the bottom edges of the seams the planks should be in contact throughout their length, and from this contact they should gradually open upwards, so that, at the outer edge of a plank 10 inches thick, the space should be about $\frac{1}{16}$ of an inch, that is, about $\frac{1}{16}$ of an inch open for every inch of thickness. It will hence be seen that, if the edges of the planks are so prepared that when laid they fit closely for their whole thickness, the force required to compress the outer edge by driving the caulking-iron into the seams, to open them sufficiently, must be very great, and the fastenings of the planks must be such as to be able to resist it. Bad caulking is very injurious in every way, as leading to leakage and to the rotting of the planks themselves at their edges.

Launching.

Ships are generally built on blocks which are laid at a declivity of about $\frac{5}{8}$ inch to a foot. This is for the facility of launching them. The inclined plane or sliding plank on which they are launched has rather more inclination, or about $\frac{3}{4}$ inch to the foot for large ships, and a slight increase for smaller vessels. This inclination will, however, in some measure, depend upon the depth of water into which the ship is to be launched.

While a ship is in progress of being built her weight is partly supported by her keel on the blocks and partly by shores. In order to launch her the weight must be taken off these supports and transferred to a movable base; and a platform must be erected for the movable base to slide on. This platform must not only be laid at the necessary inclination, but must be of sufficient height to enable the ship to be water-borne and to preserve her from striking the ground when she arrives at the end of the ways. For this purpose an inclined plane *a*, *a* (Fig. 14), purposely left unplaned to diminish the adhesion, is laid on each side the keel, and at about one-sixth the breadth of the vessel distant from it, and firmly secured on blocks fastened in the slip-

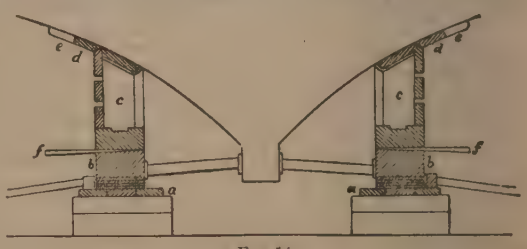

FIG. 14.

way. This inclined plane is called the sliding-plank. A long timber, called a bilgeway *b*, *b*, with a smooth under-surface, is laid upon this plane; and upon this timber, as a base, a temporary frame-work of shores *c*, *c*, called "poppets," is erected to reach from the bilgeway to the ship. The upper part of this frame-work abuts against a plank *d*, temporarily fastened to the bottom of the ship, and firmly cleated by cleats *e*, *e*, also temporarily secured to the bottom. When it is all in place, and the sliding-plank and under side of the bilgeway finally greased with tallow, soft soap, and oil, the whole framing is set close up to the bottom, and down on the sliding plank, by wedges *f*, *f*, called slivers or slices, by which means the ship's weight is brought upon the "launch" or cradle.

When the launch is thus fitted, the ship may be said to have three keels, two of which are temporary, and are secured under her bilge. In consequence of this width of support, all the shores may be safely taken away. This being done, the blocks on which the ship was built, excepting a few, according to the size of the ship, under the foremost end of the keel, are gradually taken from under her as the tide rises, and her weight is then transferred to the two temporary keels, or the launch, the bottom of which launch is formed by the bilgeways, resting on the well-greased inclined planes. The only preventive now to the launching of the ship is a short shore, called a dog-shore on each side, with its heel firmly cleated on the immovable platform or sliding-plank, and its head abutting against a cleat secured to the bilgeway, or base of the movable part of the launch. Consequently, when this shore is removed, the ship is free to move, and her weight forces her down the inclined plane to the water. To prevent her running out of her straight course, two ribands are secured on the sliding-plank, and strongly shored. Should the ship not move when the dog-shore is knocked down, the blocks re-

maining under the forepart of her keel must be consecutively removed, until her weight overcomes the adhesion, or until the action of a screw against her fore-foot forces her off.

A different mode of launching is sometimes practiced in British merchant-yards, and has been long in use in the

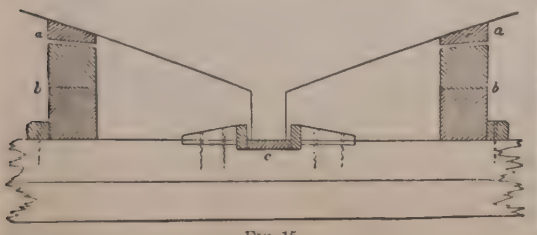

FIG. 15.

French dockyards, allowing the keel to take the entire weight of the vessel. The two pieces *a*, *a*, which are shown in Fig. 15 as being secured to the ship's bottom, are the only pieces which need be prepared according to this system for each ship, the whole of the remainder being available for every launch. A space of about half an inch is left between them and the balk timber placed beneath them, as it is not intended that the ship should bear on these balk timbers in launching, but merely be supported by them in the event of her heeling over. The ship, therefore, is launched wholly on the sliding-plank *c*, fitted under the keel.

If a ship is coppered before launching, so that putting her into a dry-dock for that purpose becomes unnecessary, it is then desirable that she should be launched without any cleats attached to her bottom. The two sides of the cradle are prevented from being forced apart when the weight of the ship is brought upon them by chains passing under the keel. Each portion of frame-work composing the launch has two of these chains attached to it, and brought under the keel to a bolt which passes slackly through one of the poppets, and is secured by a long forelock, with an iron handle, reaching above the water-line, so that when the ship is afloat it may be drawn out of the bolt. The chain then draws the bolt, and in falling trips the cradle from under the bottom. There should be at least two chains on each side secured to the fore-poppets, two on each side secured to the after-poppets, and two on each side to the stopping-up, and this only for the launch of a small ship; in larger ships the number will necessarily be increased according to the weight of the vessel and the tendency that she may have, according to her form, to separate the bilgeways. This tendency on the part of a sharp ship by a rising floor, or by her wedge-shaped form in the fore and after bodies, is great, but there is not much probability of a ship heeling over to one side or the other.

The importance of the work of the designer cannot be too highly estimated. Unfortunately there is, as has been said, "slop work" in designing as well as in putting the structure together. There is often an absence of any attempt at precautions where multiplied accidents have shown them to be necessary, as well as inconceivable carelessness in the details rendering provisions for security, where they exist in principle, useless in practice.

Slop work.

In the *Report* of the Royal Commission on Unseaworthy Ships, dated September 22, 1873, we read as follows: "Competent witnesses state that many merchant ships are built with bad iron, that they are ill put together, and sent to sea in a defective condition. It is also said that they are frequently lengthened without additional strength, and are consequently weak ships. The number of iron steamers which have been lost in the last few years, many of them having been surveyed and classed under the London or Liverpool registers, raises a question whether the regulations of these registers are sufficiently stringent to insure good shipbuilding. The directors of the Bureau Veritas have deemed it necessary to revise the rules of their register, and to increase the scantling. In the race of competition among shipbuilders it is probable that inferior materials and bad workmanship are admitted into ships."

The Commissioners on Unseaworthy Ships, referring to the proposal that the Board of Trade should superintend the construction, the periodical inspection, the repair, and the loading of all British merchant ships, said: "We consider it to be a question worthy of serious consideration, whether, in the case of passenger ships, the certificate of the Board of Trade, so far as regards specific approval, should not be expressly confined to the number of passengers to be allowed and to the accommodation for their health, comfort, and general security,—all questions of unseaworthiness of hull, machinery, and equipment being left to the owners, subject only to a general power of interference in case of danger sufficiently apparent to justify special intervention."

Where ships have to meet the stress of battle as well as that of the sea faithfulness of work is even more imperative. It is not only necessary to have perfect work, but there must also be multiplied safeguards and provisions against damage by shot, shell, ram, and torpedo as well as against the enemies which are common to all ships. In the article NAVY the peculiarities of the ship of war are described. Regarding them here simply as ships, they may be said to be distinguished neither by size nor speed. They have been far outstripped in size, the longest English ship of war built within the last twenty years being only 325 feet in length, while there are Atlantic passenger ships 200 feet longer. They have also been outstripped in speed. The highest speed ever attained in a vessel of war is that of the "Iris" and "Mercury"; and as they are only 300 feet long it is easier in vessels of greater length to get higher speeds with less engine power, and easy also to maintain it in a seaway both as a question of form and power, and also as a matter of coal endurance. The following table gives the relative dimensions of large 14-knot ships:

Ship's Name.	Length divided by Breadth (on Water Line).	I. H. P.	Dispt. in Tons.	$(\text{Dispt.})^{\frac{2}{3}}$
	ft. in.			
"Adriatic" (White Star Line)	455 7 / 41 8 = 10.45	3,600	8,250	408.3
H.M.S. "Dreadnought"	333 3 / 61 6 = 5.42	8,000	10,886	491.2
H.M.S. "Sultan"	330 0 / 58 6 = 5.64	8,600	9,286	441.8
H.M.S. "Inflexible"	324 6 / 75 0 = 4.32	8,000	11,500	509.5
H.M.S. "Neptune" late "Independencia"	304 0 / 60 10 = 5.01	8,500	9,063	434.7

The differences between the amount and complexity of fitting in the ship of war and the merchant ship are represented by the greatly increased cost per ton weight of hull. It must, however, be premised that the war ship has the weight of hull kept down to a very low standard to enable her to carry her offensive and defensive equipment,—far lower than is usual in the merchant ship. The first-class merchant ship costs £28 [$136.08] per ton weight of hull and about £13 [$63.18] per indicated horse-power for the engines. The ship of war built by the same builders under contract with the Government costs from £60 [$291.60] to £65 [$315.90] per ton weight of hull for unarmored ships, and from £70 [$340.20] to £75 [$364.50] or more for armored ships. In the case of an unarmored vessel, having a protecting deck over machinery and magazines, recently ordered, the prices were as follows:

Cost.

General average	£60 10 0 [$294.03]	per ton weight of hull.
Average of three London firms	66 0 0 [320.76]	" " "
Accepted tender	57 6 0 [278.48]	" " "

The engines for the same vessel were:

General average	£15 8 0 [$74.84]	per I.H.P.
Average of three London firms	17 5 0 [83.83]	"
Accepted tender	11 8 0 [55.40]	"

In the case of a larger armored ship the rates were:

Average price per ton weight of hull	£81 2 0 [$394.15]	
Accepted tender	71 5 0 [346.27]	
Average price per I. H. P. of engines[1]	11 1 0 [53.70]	
Accepted tender	10 7 0 [50.30]	

The use of heavy ordnance in recent times as the sole weapon for naval warfare brought about a marked distinction between the merchant vessel and the war ship, which had not previously existed. The revival of the ram and the adoption of the torpedo tend to abolish this distinction and to bring about an approximation again.

It is difficult to say what, in the very near future, will be the distinguishing characteristics of the ship of war. They will not be speed or size or coal endurance, or the power of striking with the ram, the torpedo, or the gun. It will be quite easy to arm merchant ships with these weapons, and some of

Characteristics of war ships.

[1] The indicated horse-power referred to here is that obtained by natural draft.

these ships already outstrip the war vessel in the important advantages of size and fleetness and carrying power. It is apparently in protective advantages that the essential difference will lie.

Distribution of Materials and Cost in Various Types of Ships.

	First-Class Passenger Steamers.	Cargo Steamers.	Armored Battle Ships (Barbette).	Protected 17-Knot Ships. Unarmored. Unmasted, and Unsheathed.	Protected 18-Knot Ships, Unarmored, Masted, and Sheathed.	Protected 10 to 12 Knots, Unarmored, Masted, and Sheathed.	Torpedo Boats, 19 to 20 Knots.
Length in feet	450	390	325	300	225	170	86
Displacement at load draft (in tons)	9550	6800	10,000	3630	2420	1153	31.3

" propelling machinery, per ton of its weight	£60	£50–55	£105	£111	£85[2]	£90	£373

The merchant ship is badly provided against fatal damage by collision, or by a blow delivered in any manner by which water is admitted into the ship. The propelling machinery of these ships and their steering apparatus are also dangerously exposed to artillery fire. Excepting torpedo boats, the ship of war of any size has its propelling machinery either under water or under cover of armor, and in a great number of cases there is either protection for the steering apparatus or there are two propellers. The approximation towards war-ship arrangements which is needed in the merchant ship is the adoption of more than one screw and of greater breadth of ship, so that defences round machinery may be created in time of war. Both these changes in merchant-ship practice are demanded also by mercantile interests. The increase in breadth amidships would greatly reduce the risk of foundering in collisions and give more spacious accommodation amidships. Such increase when accompanied by fine ends is also favorable to speed.

Changes needed in merchant ships.

The use of two screws is economical of power, and is a much-needed security against the evil results of an accident to an engine, a shaft, or a propeller. The time will doubtless come when a single propeller in a large passenger ship will be regarded as an unpardonable fault, and when the division into compartments now common will be held to be no better than a delusion and a snare.

The protection given to the regular ships-of-war by side armor, or by a protecting deck, at or near the water-line, will probably become a definite and indispensable feature in them, and may, perhaps, be their only distinguishing characteristic, apart from their outfit and equipment.

Armor.

If this should prove to be the issue of events, their course will have been very indirect. In the ships-of-war of the last century no attempt was made to employ armor on the sides or to prevent the passage of projectiles and water into the holds by means of a protecting deck. There was a deck just below the water-line, but it had no protective qualities. It served, among other things, to furnish passage ways in action for the carpenter and his crew to get at the inner side of the wooden walls of the ship at and near the water-line, so that when shot entered there the holes might be immediately plugged. When screw propulsion was introduced into these ships, and it was found practicable to keep the engines and boilers under water, it would have been possible to place a deck over the machinery and beneath the water, which would have greatly added to the security of the engines, boilers, and magazines. The space above this deck might also have been so subdivided into compartments as to have protected the buoyancy and stability of the ship against the immediately fatal results of the invasion of water. The protection of the buoyancy and stability by these means would not have been absolute, in the sense of making the ship safe, but it would have been of the utmost value as compared with ships, otherwise similar, but having no such protection.

Thirty years passed between the date when screw-propeller engines were placed beneath the water-level in ships of war and that at which a committee on designs, under the presidency of Lord Dufferin, proposed to place such a covering deck over them or to construct a water-line raft-body. The proposal of the main body of the committee was to associate such a raft-deck for the protection of the buoyancy and stability of the ship against artillery with a central armored citadel. That of the minority was to suppress the armor in the region of the water-line entirely, and to protect buoyancy, stability, machinery, and magazines by a raft-deck alone. In 1873 the plan as indicated by the main body of the committee was put into practice nearly simultaneously in the "Duilio" and "Dandolo" in Italy and in the "Inflexible" in England. In 1878 the system as conceived in principle by the minority of the committee of 1871, although not in the manner they recommended, was adopted in much smaller vessels in the British navy. A raft-deck was introduced into the "Comus" class of corvettes of 2380 tons displacement, a class which was regarded as unarmored. Since that date the raft-deck has been adopted in a more or less complete form in nearly all classes of unarmored ships in the English navy. So it has come about that, out of some 850 unarmored ships of war built and building in Europe, 47 have such protecting raft-decks. Of these 32 are English. There can be no doubt that all unarmored ships of war will eventually be protected in this manner. The number of so-called iron-clads built and building in Europe is 270. Of these, 34 are based on the recommendation of the committee on designs; 18 of them are English. There are six other English ships with central citadels and underwater protecting decks, built more than twenty years ago, but the raft-body principle is absent in them.

Committee on designs.

If the passage from the steam line-of-battle ship of 1840–1860 to the "Admiral" class of 1884 had been made under the guidance of the principles of the committee of 1871, European nations would not find themselves possessed of large fighting ships covered from end to end, or over large areas of their sides, with thin armor, penetrable to a very large proportion of the guns brought against them. But the sailors of 1854–1860 did not take the view that buoyancy and stability, and machinery and magazines, were the vital parts, needing defence by armor or by a raft-deck. They dreaded the effects of shell exploding between decks, setting fire to the ships, and converting the decks, crowded with men, into slaughter-houses. Their demand was, "Keep out the shell." So it came about that iron armor-plates, thick enough to keep out the most powerful shell of the time, were worked upon the sides of the ships, and the guns were fought through ports cut in this armor. This feeling was so strong that the English Admiralty built the "Hector" and "Valiant" with armored batteries overlapping by many feet at each end the armor beneath them, which protected the buoyancy, stability, machinery, and magazines. Guns increased in power, and the armor was gradually thickened to resist them, until from 4½ inches of armor, through which broadside ports were cut, 9 inches and 10 inches were reached. But this thickening of the armor had so reduced the possible number of the guns in a ship of moderate size, and the guns required for breaching such armor had so increased in weight, that the broadside ship had to give way to the turret or barbette ship, in which about four such guns were all that could be carried, and these had to be worked on turn-tables in or near the central line of the ship.

The point now reached in all navies is that the broadside iron-clad with ports cut through an armored side, as invented in France by M. Dupuy de Lôme, and copied by

[1] Of this the vertical armor (costing before it is worked up £70 [$340.20] to £90 [$437.40] per ton) is nearly 2000 tons.

[2] Average of six vessels built by Elder.

every power, is obsolete. Guns must be worked singly or in pairs on revolving turn-tables, each turn-table being surrounded by an armored tower, forming the loading chamber or protecting the mechanism. The side armor protecting the buoyancy, stability, machinery, and magazines, although not introduced for that purpose originally, is retained in France for very large ships, is given up in Italy in favor of a raft-body, and is retained partially in England and Germany in conjunction with a raft-body.

The use of armor has arrested the development of the shell. But it is not inconceivable that its abandonment in front of the long batteries of guns in the French and Italian ships will invite shell attack, and make existence in such batteries, if they are at all crowded, once more intolerable. It remains to be seen whether in that case exposure will be accepted, or a new demand made for armor, at least against the magazine gun and the quick-firing gun. If exposure is accepted, it will be on the ground that the number of men at the guns is now very few, that the gun positions are numerous and the fire rapid, and that, if the guns had once more to be fought through ports in armor, the number of gun positions would be reduced, and the fragments of their own walls, when struck by heavy projectiles, would be more damaging than the projectiles of the enemy.

Internal armor for the protection of the heavy armor-breaching guns must be retained so long as such guns are used, and if they were abandoned an enemy could cover himself with armor invulnerable to light artillery. This the French attempted to do in inaugurating the system. They have been driven from it by the growth of the gun. Abandon the heavy gun, and complete armor-plating might again be adopted.

We must conclude that the buoyancy, stability, machinery, and magazines must be protected as far as possible against fatal damage from a single blow of these armor-breaching guns. The tendency will be to come to the lightest form of such protection. That lightest form appears to be a protecting deck a little above the water-level throughout the greatest part of its surface, but sloping down at the sides and at the ends, so as to meet the side walls of the ship under the water-line. However the armor is arranged (apart from a complete covering with invulnerable plating),—whether as a belt with its upper edge 3 feet out of the water, as in the French ships; as a central armored citadel and a raft-body at the ends, like English and German ships; or as a raft-body throughout, like the Italian ships,—shot holes in action will admit water and gradually reduce the necessary stability of the ship. In the French ships the assistance of the unarmored upper parts is as necessary to prevent them from upsetting in anything but smooth water as is the assistance of the unarmored raft ends in the English and German ships. In the intact condition the English ships have far greater stability than those of France. In the English ships a reserve of stability is provided, against the contingency of loss by injuries in action. In the French ships no more is provided than is required for the intact condition. The French have not accepted the position taken up in England that much greater initial stability may be given to heavily armored broad ships than is usually given, without causing heavy rolling. Nor have they accepted the further incontrovertible truth that the free passage of water in the raft-body from side to side of the ship in rolling is rapidly effective in quelling the motion and bringing the ship to rest in the upright position.

Propulsion.

Sails.

The propulsion of ships by sails differs from the drifting of bodies in the air before the wind in a most important respect. Ships may drift or sail in the direct course of the wind, and they will then differ from air-borne bodies only in the comparative slowness imposed by the resistance of the water. Ships having the same length as breadth or rather opposing the same form and area to side progress as to forward progress could never do other than sail before the wind. No disposition of canvas could make them deviate to the right or left of their course to leeward. But by an alteration of form giving them greater length than breadth, and greater resistance to motion sideways than to motion endwise, they came to possess the power of being able not only to sail to the right or left of the course of the wind, before the wind, but also to sail towards the wind. The wind can be made to impel them towards the point from which it is blowing by means of the lengthened form acted on by the resistance of the water.

Motion directly towards the wind cannot be maintained, but by sailing obliquely towards it first to one side and then to the other progress is made in advance, and the vessel "beats to windward." The action is like that which would be required to blow a railway car to the eastward by the action of an easterly wind. If the line of rails were due east and west, and the wind were always direct from the east, the thing could not be done. But with a wind to the south or north of east, by setting a sail in the car so that its surface lies between the course of the wind and the direction of the rails, it would then receive the impulse of the wind on its back and would drive the car forwards. There would be a large part of the force of the wind ineffective because of the obliquity of the sail; and of the part which is effective a large portion would be tending to force the car against the rails sideways, but there would be progression to windward. In the case of the ship the resistance to side motion is due to the unsuitability of the proportions and form for progress in that direction as compared with progress ahead, but still there is motion transversely to the line of keel. This motion is called leeway. As the ship moves to leeward and ahead simultaneously there is a point of balance of the forces of the fluid against the immersed body—a centre of fluid pressure. The object of the constructor is to place the masts in the ship in such positions that the centre of pressure of wind upon the sails shall fall a little behind or astern of this centre of resistance of the fluid. In that case there is a tendency in the ship to turn round under the action of these two forces, and to turn with her head towards the wind. This tendency is corrected by the action of the rudder. If the tendency to turn were the other way, although that could also be corrected by the rudder, yet there would be danger of the wind overcoming the rudder action in squalls, and the ship would then come broadside to the wind. In that case, while she might have been quite capable of bearing the pressure of the wind blowing obliquely upon her sails, she might have her sails blown away, or her masts broken, or be herself capsized by the direct impulsion of the wind upon the sail and upon the hull of the ship.

Many examples of disposition of sails might be given. Their disposition is always made to satisfy the conditions that as much sail as possible is required, but if the vessel is small it must be capable of being instantly let go in a squall, or when the wind is gusty. Otherwise, where it cannot be readily let go, its area should be capable of reduction in squally weather, still retaining its efficiency, so that no pressure of the wind should be capable of upsetting the ship. If a sudden violent squall should strike the ship she should find relief, not by a large inclination, but by the blowing away of the sails out of the bolt-ropes, or the carrying away of the masts. One or other of these must of course happen if the area of canvas and the strength of the sails and of the spars are so proportioned at the moment the squall strikes the ship as to be less than the resistance offered by the stability of the ship to a large inclination. Ships are sometimes, when struck by a squall, blown over on to their sides, the sails being in the water. If the sails or spars are then cut away or otherwise got rid of the ship may right herself.

In the *Transactions* of the Institution of Naval Architects for 1881, Mr. W. H. White says:

"Any investigation of the behavior of sailing ships at sea must take account of the conditions belonging to the discussion of their rolling when no sail is set, and must superpose upon those conditions the other and no less difficult conditions relating to the action of the wind upon the sails, the influence of heaving motions upon the stability, and the steadying effect of sail-spread.

"It may fairly be assumed that the labors of the late Mr. W. Froude have made it possible to predict, with close approximation to truth, the behavior of a ship whose qualities are known and which has no sails set, when rolling among waves of any assumed dimensions. By a happy combination of experimental investigation and mathematical procedure, Mr. Froude succeeded in tracing the motion from instant to instant, and checked the results thus obtained by comparison with the actual observations made in a sea-way on the behavior of the 'Devastation.' The details of his method, and examples of its application, will be found in the *Transactions* for 1875, and in the appendix to the report of the 'Inflexible' committee.

"The conclusion I have reached, after a careful study of the subject, is that we need very considerable extensions of our knowledge of the laws of wind-pressure before more exact investigations will be possible so as to enable us to pronounce upon the safety or danger of a sailing ship. Nor must it be overlooked that sailing ships are not to be treated as machines worked under certain fixed conditions. Their safety depends at least as much upon seamanship and skilful management as upon the qualities with which they are endowed by their designers. Moreover, it is idle to pretend that, in determining what sail-spread can be safely given to a ship, the naval architect proceeds in accordance with exact or purely scientific methods. He is largely influenced by the results of experience with other ships, and thus proceeds by comparison rather than by direct investigation from first principles. Certain scientific methods are employed, of course, in making these comparisons. For example, the righting moment at different angles of inclination is usually compared with the corresponding 'sail-moment'; but even here certain assumptions have to be made as to the amount of sail to be reckoned in the

calculation, and as to the effective wind-pressure per unit of sail-area. Between ship and ship these assumptions are unobjectionable, but they are not therefore to be regarded as strictly true.

"The calculations of curves of stability and the determination of the ranges of stability for ships form important extensions of earlier practice. But, even when possessed of this additional information, the naval architect must resort to experience in order to appreciate fairly the influence of seamanship and the relative manageability of ships and sails of different sizes. There can be no question but that a good range and large area of a curve of stability denote conditions very favorable to the safety of a ship against capsizing. But, in practice, it frequently happens that such favorable conditions can scarcely be secured in association with other important qualities, and a comparatively moderate range and area of the curve of stability have to be considered when the designer attempts to decide whether sufficient stability has been provided. Under these circumstances experience is of the greatest value; *a priori* reasoning cannot take the place of experience, because (as remarked above) the worst combination of circumstances cannot be fixed, and because some important conditions in the problem are yet unsettled. Certain arbitrary standards may be set up, and ships may be pronounced safe or unsafe; but this is no solution of the problem. There are classes of ships in existence which have been navigated in all weathers, under sail, and in all parts of the world, which might be pronounced unsafe if tested by some of the standards that have been proposed; but the fact that not a single vessel of that class has been capsized or lost at sea during many years will probably be accepted, in most quarters, as sufficient evidence of the seaworthiness of these classes, and as an indication of the doubtful authority of the proposed standards."

For the different kinds of sails, and for sailmaking, see SAIL.

Steam.

The "Comet" was the first steam-vessel built in Europe that plied with success in any river or open sea. She was built in Scotland in 1811–12 for Mr. Henry Bell, of Helensburgh, having been designed as well as built by Mr. John Wood, at Port-Glasgow. The little vessel was 42 feet long and 11 feet wide. Her engine was of about four horse-power, with a single vertical cylinder. She made her first voyage in January, 1812, and plied regularly between Glasgow and Greenock at about 5 miles an hour. There had been an earlier commercial success than this with a steam vessel in the United States, for a steamer called the "Clermont" was built in 1807, and plied successfully on the Hudson River. This boat, built for Fulton, was engined by the English firm of Boulton & Watt. The reason for this choice of engineers by Fulton appears to have been that Fulton had seen a still earlier steamboat for towing in canals, also built in Scotland, in 1801, for Lord Dundas, and having an engine on Watt's double-acting principle, working by means of a connecting rod and crank and single stern wheel. This vessel, the "Charlotte Dundas," was successful so far as propulsion was concerned, but was not regularly employed because of the destructive effects of the propeller upon the banks of the canals. The engine of the canal boat was made by Mr. William Symington, and he had previously made a marine engine for Mr. Patrick Miller, of Dalswinton, Dumfriesshire. This last-named engine, made in Edinburgh, in 1788, marks, it is said, the first really satisfactory attempt at steam navigation in the world. It was employed to drive two central paddle-wheels in a twin pleasure-boat (a sort of "Castalia") on Dalswinton Loch. The cylinders were only 4 inches in diameter, but a speed of 5 miles an hour was attained in a boat 25 feet long and 7 feet broad. The first steam vessel built in a royal dockyard was also called the "Comet." She appears to have been built about the year 1822 and was engined by Boulton & Watt. This ship had two engines of forty horse-power each, to be worked in pairs on the plan understood to have been introduced by the same firm in 1814. In 1838 the "Sirius" and "Great Western" commenced the regular Atlantic passage under steam. The latter vessel, proposed by I. K. Brunel, and engined by Maudslay Sons & Field, made the passage at about 8 or 9 knots per hour. One year earlier (1837) Captain Ericsson, a scientific veteran who is still among us (1886), towed the Admiralty barge with their lordships on board from Somerset House to Blackwall and back at the rate of 10 miles an hour in a small steam vessel driven by a screw.

Screw propellers.

The screw did not come rapidly into favor with the Admiralty, and it was not until 1842 that they first became possessed of a screw vessel. This vessel, first called the "Mermaid" and afterwards the "Dwarf," was designed and built by the late Mr. Ditchburn, and engined by Messrs. Rennie. In 1841–3 the "Rattler," the first ship-of-war propelled by a screw, was built for and by the Admiralty under the general superintendence of Brunel, who was also superintending at the same time the construction of the "Great Britain," built of iron. The engines of the "Rattler," of 200 nominal horse-power, were made by Messrs. Maudslay. They were constructed, like the paddle-wheel engines of that day, with vertical cylinders and overhead crank-shaft, with wheel gearing to give the required speed to the screw. The next screw engines made for the Royal Navy were those of the "Amphion," 300 nominal horse-power, made in 1844 by Miller and Ravenhill. In these the cylinders took the horizontal position, and they became the type of screw engines in general use. This ship had a screw-well and hoisting gear for the screw. In 1845 the importance of the screw propeller for ships of war became fully recognized, and designs and tenders were invited from all the principal marine engineers in the kingdom. The Government of that day then took the bold step of ordering at once nineteen sets of screw engines. Six of these had wheel gearing; in all the rest the engines were direct-acting. The steam pressure in the boilers was from 5 to 10 lb only above the atmosphere, and if the engines indicated twice the nominal power it was considered a good performance. The most successful engines were those of the "Arrogant" and "Encounter" of Messrs. Penn. They had a higher speed of piston than the others, and the air-pumps were worked direct from the pistons, and had the same length of stroke. These engines developed more power for a given amount of weight than other engines of their day, and were the forerunners of the many excellent engines on the double-trunk plan made by this firm for the navy. The engines with wheel-gearing for the screws were heavier, occupied more space, and were not so successful as the others, and no more of that description were ordered for the British navy.

Economical engines.

Up to 1860 neither surface-condensers nor superheaters were used in the navy. The consumption of fuel was about 4½ lb per one horse-power per hour. In that year (1860) three ships, the "Arethusa," "Octavia," and "Constance," were fitted respectively by Messrs. Penn, Messrs. Maudslay, and Messrs. Elder, with engines of large cylinder capacity to admit of great expansion, with surface-condensers and superheaters to the boilers. Those of the "Arethusa" were double-trunk, with two cylinders; those of the "Octavia" were three-cylinder engines; and those of the "Constance" were compound engines with six cylinders; the first two were worked with steam of 25 lb pressure per square inch, and the last with steam of 32 lb pressure. All these engines gave good results as to economy of fuel, but those of the "Constance" were the best, giving one indicated horse-power with 2½ lb of fuel. But the engines of the "Constance" were excessively complicated and heavy. They weighed, including water in boilers and fittings, about 5½ cwts. per maximum indicated horse-power, whereas ordinary engines varied between 3½ and 4¾ cwts.

For the next ten years engines with low-pressure steam, surface-condensers, and large cylinder capacity were employed almost exclusively in the ships of the Royal Navy. A few compound engines, with steam of 30 lb pressure, were used in this period with good results as to economy, but they gave trouble in some of the working parts. Compound engines, with high-pressure steam (55 lb), were first used in the Royal Navy in 1867, on Messrs. Maudslay's plan, in the "Sirius." These have been very successful. In the Royal Navy as well as in the mercantile marine, the compound engine is now generally adopted. They have been made rather heavier than the engines which immediately preceded them, but they are about 25 per cent. more economical in fuel, and, taking a total weight of machinery and fuel together, there is from 15 to 20 per cent. gain in the distance run with a given weight.

Reduction in weight of engines.

Wrought-iron is largely used in the framing in the place of cast-iron, and hollow propeller shafts made of Whitworth steel. By these means the weight is being reduced, and it is to be hoped that a still further reduction may yet be made by the use of high-class materials in the engines and steel in the boilers.

Mr. Thornycroft, of Chiswick, and others, by means of high rate of revolution, forced combustion, and the judicious use of steel, have obtained as much as 455 indicated horse-power with a total weight of machinery of 11¾ tons, including water in boilers. The ordinary weight of a sea-going marine engine of large size, with economical consumption of fuel, excepting a few of very recent construction, would be six or seven times as great. By closing in the stoke-holes and employing fans to create a pressure of air in them capable of sustaining from one to two inches of water in the gauges the consumption of coal per square foot of fire-grate per hour may be raised to 130 lb and upwards. The indicated horse-power which can be obtained in ordinary cases with the steam-blast in the chimney to quicken consumption does not exceed ten. But by the forced draft above described it can be raised with ordinary boilers to 17 to 18 indicated horse-power per square foot of fire-grate. In torpedo boats with locomotive boilers over 28 horse-power per foot of fire-grate is attainable.

The following observations on efficiency are taken from the work of Mr. Sennett on *The Marine Steam Engine:*

Efficiency.

"In every machine there are always certain causes acting that produce waste of work, so that the whole work done by the machine is not usefully employed, some of it being exerted in overcoming the friction of the mechanism, and some wasted in various other ways. The fraction representing the ratio that the useful work done bears to the total power expended by the machine is called the efficiency of the machine; or—

$$\text{Efficiency} = \frac{\text{Useful work done.}}{\text{Total power expended.}}$$

In the marine steam engine, in which the useful work is measured by its propelling effect on the ship, there are four successive stages, in each of which a portion of the initial energy is wasted, and these four causes all tend to decrease the efficiency of the engine as a whole.

"In the first place, only a portion of the heat yielded by the combustion of the coal in the furnaces is communicated to the water in the boiler, the remainder being wasted in various ways. The fraction of the total heat evolved by the combustion of the coal, that is, transmitted to the water in the boiler, is in ordinary cases not more than from $\frac{5}{6}$ to $\frac{7}{8}$. This fraction is called the efficiency of the boiler.

"Secondly, the steam, after leaving the boiler, has to perform mechanical work on the piston of the engine; but this work, in consequence of the narrow limits of temperature between which the engine is worked, is only a small fraction of the total heat contained in the steam—say from $\frac{1}{8}$ to $\frac{1}{10}$, according to the kind of engine and rate of expansion employed. This fraction, representing the ratio of the mechanical work done by the steam to the total amount of heat contained in it, is called the efficiency of the steam.

"Thirdly, in the engine itself a part of the work actually performed by the steam on the pistons is wasted in overcoming the friction of the working parts of the machinery and in working the pumps, etc. The remainder is turned into useful work in driving the propeller. The fraction representing the ratio that this useful work bears to the total power exerted by the pistons is called the efficiency of the mechanism.

"Fourthly, the propeller, in addition to driving the ship ahead, expends some of the power transmitted to it in agitating and churning the water in which it acts, and the work thus performed is wasted,—the only useful work being that employed in overcoming the resistance of the ship and driving her ahead. The ratio of this useful work to the total power expended by the propeller is called the efficiency of the propeller.

"The resultant efficiency of the marine steam engine is made up of the four efficiencies just stated, and is given by the product of the four factors representing respectively the efficiencies of the boiler, the steam, the mechanism, and the propeller. Any improvement in the efficiency of the marine steam engine, and, consequently, in the economy of its performance, is, therefore, due to an increase in one or more of these elements."

Under STEAM ENGINE will be found a discussion of the first three of the efficiencies enumerated above. Propulsion and propellers have to be considered here.

Propellers.

"The principle upon which nearly all marine propellers work," says Mr. Sydney Barnaby, "is the projection of a mass of water in a direction opposite to that of the required motion of the vessel. When a vessel is in motion at a regular speed the reaction of the mass of water projected backwards by the propeller is exactly equal to the resistance experienced by the vessel. When it is clearly understood that propulsion is obtained by the reaction of a mass of water projected sternwards with a velocity relative to smooth water, the absurdity is at once seen of attempting to get a propeller to work without slip. If there is no slip there is no resultant propelling reaction except in the limiting case where the mass of water acted upon is infinite. The whole problem, therefore, resolves itself into this—What is the best proportion between the mass of water thrown astern and the velocity with which it is projected, that is, if the screw propeller is under consideration, the ratio between its diameter and its pitch?"

"There are four different kinds of propellers apart from sails—the oar, the paddle-wheel, the screw, and the water jet.

"The first and oldest of them—the oar—may be used in two ways. The action may be intermittent, as in rowing, when the water is driven astern during half the stroke and the instrument brought back above the water; or its action may be continuous, as in sculling. When used as in rowing is is exactly analogous to a paddle-wheel, while the action of the scull closely resembles that of the screw. It is supposed that in the ancient galleys, which were propelled by a large number of oars in several tiers or banks, the oars hung vertically and worked inwards and outwards with a sculling action. They were not removed from the water, but served as props when the vessel was aground. The oars were always propelling the vessel, in both parts of the stroke. The rowers generally sat with their faces outwards and forwards. There was great overhang of the sides to allow of several tiers of rowers one above another. The oar as used for rowing is a very efficient instrument. To obtain the maximum efficiency out of it a constant pressure should be maintained upon the oar, so that the water is started gradually from rest, and the acceleration uniformly increased throughout the whole of the stroke. A glance at a university crew will show that the stroke is kept up with a uniform pressure and without any jerk."

Speaking of the screw propeller, Mr. S. Barnaby says: "The speed with which water can follow up the blades of a screw depends upon the head of water over it, but when the immersion is sufficient to exclude air a head of water equivalent to 30 feet is supplied by the atmosphere, as has been pointed out by Prof. Osborne Reynolds. Experiments on the model of the Thornycroft screw have shown that the efficiency, which is as much as 70 per cent. when properly immersed, falls to about 50 per cent. when breaking the surface of the water. As a result of a change from a diameter of 5 feet 10 inches to 4 feet 6 inches the speed of the first-class torpedo boat was raised from 18 to 20 knots, other conditions remaining the same.

"There is no doubt that the stern is the best position for the screw. As a vessel passes through the water the friction imparts motion to the layer of water rubbing against the side. This layer increases in thickness towards the stern so that after the vessel has passed through, a considerable quantity of water is left with a motion in the same direction as the vessel. If the screw works in this water it is able to recover some of the energy which has been expended by the ship in giving it motion. The speed of this water, which Rankine estimates may be as much as one-tenth of the speed of the vessel, does not depend upon the form but upon the nature and extent of the surface. As it is a necessity that there should be such a wake, it is a distinct advantage to place the propeller in it and allow it to utilize as much as possible of the energy it finds there. It is important not to confound this water, which has had motion given to it by the side and bottom of the ship, with the wave of replacement, that is the water filling in behind the ship. It should be the aim to interfere as little as possible with this motion, as such interference augments the resistance of the ship very considerably, even in well-formed ships. The propeller should, therefore, be kept as far away from the stern as possible.

"In the small high-speed stern launches the propeller has been kept outside the rudder with advantage to the speed. What is required is that before reaching the screw the water shall have given out upon the stern of the ship the energy put into it by the bow. If a screw propeller is placed behind a bluff stern so that its supply of water is imperfect it will draw in water at the centre of the driving face and throw it off round the tips of the blades, like a centrifugal pump, thus producing a loss of pressure upon the stern of the vessel. For very high speed vessels several propellers would enable the weight of the machinery to be kept down. The weight of an engine of a given type per indicated horse-power varies inversely as the number of revolutions per minute; that is, the greater the number of revolutions the less the weight per indicated horse-power.

"There is a certain quantity of work which must be lost with any propeller, and it is equal to the actual energy of the discharged water moving astern of the propeller with a velocity relative to still water. As this energy varies as the weight multiplied by the square of the velocity, if we double the quantity of water acted upon we double the loss from this cause, but if we double the velocity with which the water is discharged we increase the loss fourfold. This shows the advantage of acting upon a large column of water, and leaving it with as small a speed as possible relative to still water. For this reason the screw is a more efficient instrument than a paddle-wheel, and the jet propeller, with its small area of jet, is so much inferior to the screw. From the above considerations it would appear that the larger the diameter of a screw and the smaller the slip the greater the efficiency would be. There is, however, another element of loss which has to be considered, which imposes a limit to the size of a screw in order to obtain the best efficiency. This element is the friction of the screw blades. How large the effect of this element may be is shown by the case of H.M.S. 'Iris.' This ship was originally fitted with two four-bladed propellers, 18 feet in diameter, and with 18 feet pitch or velocity of ad-

vance per revolution. She obtained a speed with these propellers of 15¾ knots with an expenditure of 6369 horse-power. Two blades were then taken from each propeller, reducing the total number from eight to four. The indicated horse-power then required for the same speed was 4369, or two thousand less horse-power. This amount had been lost in driving the four aditional blades."

Causes of inefficiency.

"The causes of loss of work incidental to propellers of different kinds may be summed up as follows: (1) Suddenness of change from velocity of feed to velocity of discharge. Propellers which suffer from this cause are the radial paddle-wheel and the common uniform pitch screw; while those which in varying degree avoid it are the gaining pitch screw, the feathering paddle-wheel, Ruthven's form of centrifugal pump, and the oar. (2) Transverse motion impressed on the water. Propellers which lose in efficiency from this cause are ordinary screw-propellers, which impart rotary motion, radial wheels, which give both downward and upward motion on entering and leaving the water, and oars, which impart outward and inward motion at the commencement and end of the stroke respectively. This loss is greatly reduced in the guide propeller, as the guides take the rotary motion out of the water and utilize it in so doing. (3) Waste of energy of the feed water. This is experienced in the jet propeller as generally applied."

The present condition of the case of screw steamship propulsion appears, according to Mr. Froude's estimate, to be that, calling the effective horse-power (that is, the power due to the net resistance) 100, then at the highest speeds the horse-power required to overcome the induced negative pressure under the stern consequent on the thrust of the screw is 40 more; the friction of the screw in the water is 10 more; the friction in the machinery 67 more; and air-pump resistance perhaps 18 more; add to this 23 for slip of screw, and we find that in addition to the power required to overcome the net resistance=100, we need 40+10+67+18 +23, making in all 258; *i.e.*, at maximum speeds the indicated power of the engines needs to be more than two-and-a-half times that which is directly effective in propulsion.

(N. B.)

Boatbuilding.

The foregoing article may be supplemented by a brief account of boatbuilding. The distinction between this and shipbuilding is not of a marked character and cannot be sharply defined. But for all practical purposes the builder of a vessel without a deck, or but partially decked, and propelled partly by sails and partly by oars, or wholly by oars, may be defined as a boatbuilder.

The boats in general use at present may be classified as racing boats, pleasure boats, or boats used for commercial purposes. Racing boats (compare ROWING) are generally built of mahogany, and are the most perfect specimens of the boatbuilder's art. The outrigger sculling boat measures from 30 to 35 feet long, 12 to 14 inches in breadth, and 9 inches in depth, weighing only from 35 to 45 lb, and the eight-oared outrigger, being from 55 to 65 feet long by 2 feet 2 inches to 2 feet 5 inches in breadth, weighs about 300 lb. Pleasure boats vary in form and dimensions from the 15-feet rowing boat used on the sea-coast to the gondola type found principally on the canals of Venice and used occasionally on the Thames, etc., for ceremonial pageants. Boats used for commercial purposes embrace fishing, canal, and ships' boats. Fishing boats (compare FISHERIES) are gradually passing from the sphere of the boatbuilder to that of the shipbuilder,—the open boats of former years being in many cases replaced by large, strong, decked craft more able to withstand the gales of the British coasts. Canal boats are generally long, narrow, and shallow, from 50 to 70 feet long by 8 to 10 feet in breadth, and from 4 to 5 feet in depth. All sea-going vessels are required by statute to be provided with boats fully equipped for use, not fewer in number nor less in their cubical contents than what is specified for the class to which the ship belongs. The boats vary considerably in form and dimensions as well as in material and construction, according to the service intended. The number of boats a passenger steamer of 1000 tons and upwards is required to carry is six or seven, according to the dimensions of the boats. In either case two of the largest boats must be fitted as lifeboats. If the smaller number is carried, the set will consist of two lifeboats, one launch, two cutters or pinnaces, and one gig.

Lifeboats are built both ends alike, having a sheer or rise from midships towards stem and stern of ½ inch to ¾ inch per foot of length. They have air cases of copper or yellow metal fitted in the ends and along the sides of the boat, of sufficient capacity to give each person carried in the boat one and a half cubic feet of strong enclosed air-space (compare vol. xiv. p. 574). Cutters are similar in form, but of smaller dimensions than lifeboats; pinnaces are about the same dimensions as cutters, but have square sterns. Gigs are of lighter construction and finer form than pinnaces. A service boat called a dingy is also carried, for the conveyance of light stores between the shore and the vessel. Boats, when carried so close to the funnel of a steamer as to be injuriously affected by the heat therefrom, have of late years been built of zinc, iron, or steel. Those built of steel have plates $\frac{1}{16}$ inch thick and galvanized, the keel, stem, stern, and deadwood knees being of wood, to which the plating is attached.

The following is an outline of the method of construction. The designer lays down on paper the lines and body-plan of the craft, which are afterwards traced full size on the floor of the drawing-loft. From these full-sized sections moulds are made. The stem and stern posts, having been cut out to the shape designed, are tenoned into mortises in the keel. Two knees overlap, and bind the stem and stern posts to the keel, and are bolted with through bolts and clenched outside over a ring or washer. A stout batten of wood is then nailed between the stem and sternpost heads to connect them together, and a line is then stretched from stem to sternpost to represent the water line. The keel, stem, and sternposts being in position on the stocks, the stem and stern posts are then plumbed and secured by stays of wood. The rabbets in the keel, stem, and stern posts are then cut out with a chisel, after which the moulds are put into their proper places, plumbed with the water-line, and kept in position by stays. The planking is then proceeded with, strake after strake, and when the boat is planked up to the top strake, the floors and timbers are put in. The floor extends across the keel and up to the turn of the bilge. They are fastened through the keel with copper or yellow metal bolts and to the planking with copper nails.

The timbers generally are about 1 inch by ¾ inch, and are sawn out of a clean piece of American elm, then planed and rounded. After being steamed they are fitted into the boat, and as soon as each is in position, and before it cools, it is nailed fast with copper nails. The gunwale is next fitted, a piece of American elm about 2 inches square; a breast-hook is fitted forward, binding the gunwale, top strake, stern and apron together; and aft the gunwale and top strake are secured to the transom by either a wooden or iron knee. A waring or stringer, about 3 inches by ¾ inch, of American elm, is then fitted on both sides of the boat, about 8 to 9 inches below the gunwale, on the top of which the thwarts or seats rest. The thwarts are secured by knees, which are fastened with clench bolts through the gunwale and top strake and also through the thwart and knee. The boat generally receives three coats of paint and is then ready for service.

The following are the dimensions of boats in the British merchant service:

	Length.	Breadth.	Depth.
Lifeboat	28 ft. 6 in.	8 ft. 6 in.	3 ft. 6 in.
Cutter	26 ft.	7 ft.	3 ft.
Pinnace	24 ft.	6 ft. 6 in.	2 ft. 8 in.
Gig	18 ft.	5 ft. 6 in.	2 ft. 3 in.
Dingy	16 ft.	5 ft. 6 in.	2 ft. 3 in.

SHIPLEY, a town of England, in the West Riding of Yorkshire, is situated on the south bank of the Aire, in the neighborhood of a picturesque pastoral country, at the junction of the Leeds and Bradford Railway with the Bradford, Skipton, and Colne line, 3 miles north of Bradford. The church of St. Paul, an elegant structure in the Gothic style erected in 1820, was altered and improved in 1876. The manufacture of worsted is the principal industry, and there are large stone quarries in the neighborhood. A local board was established in 1853. The population of the urban sanitary district (area 1406 acres) in 1871 was 11,757, and in 1881 it was 15,093.

SHIPPING. The island of Britain (to the shipping of which the present historical notice is mainly restricted) is well fitted to serve as a commercial depôt,

both by the number of its natural harbors and the variety of its products. There is evidence that Phœnician traders visited it for tin, and in after times it served as one of the granaries of the Roman empire. On the other hand raw wool was a staple article of commerce in the Middle Ages, while the supremacy of English manufactures in modern days has contributed to the development of British shipping till it has grown out of all comparison with anything in ancient or mediæval times.

Britain must have been one of the most distant points that was visited by Phœnician or Carthaginian ships. Adventurous as their sailors were when compared with those of other races, and ready as they were to carry on trading on behalf of neighboring states, it is not clear that they ever sailed across the Indian Ocean or ventured beyond the Persian Gulf, even in the service of the Egyptians (Brugsch). Their coasting habits led to the settlement of a chain of colonies along the Mediterranean shores, and that sea was wide enough to form a convenient barrier between the Greek and the Carthaginian settlements. When their empire was at length destroyed the Romans became the heirs of their enterprise, but do not appear to have pushed maritime adventure much further or opened out many new commercial connections.

Though the Angle and Saxon tribes were doubtless skilled both in shipbuilding and in the management of their vessels at the time when they conquered Britain, these arts had greatly decayed during the four centuries that elapsed before the time of Alfred, who endeavored to improve on existing models (*Eng. Chron.*, 897). Hence the necessity of resisting the Danes, with the subsequent fusion of Danish and other elements in our nationality, may be taken as marking the period when English shipping had its rise. Apart from incidental notices of communication with other lands, there is clear evidence, from the early English laws, of efforts to encourage commerce, particularly in the status which was accorded to traders and the protection afforded to merchant ships. The whole of these arrangements seem to imply that the merchant was the owner of the vessel, who "adventured" with his cargo, and sailed in his ship himself; but these voyages were probably undertaken for the most part to ports on the other side of the Channel, as it does not appear that English ships penetrated to the Mediterranean till the time of the crusades.

The steady development of English shipping during the Norman and early Plantagenet reigns may be inferred from the more frequent intercommunication with the Continent and the many evidences of the increasing importance of the commercial classes and trading towns. In the time of Edward III. the shipping interest suffered a temporary check from the removal of the staple to England, a step which was taken with a view of attracting foreign merchants to visit England (1353). This policy, however, was soon reversed, and the reign of that monarch was on the whole favorable to the development of shipping. He was himself fond of the sea, and commanded in person in naval engagements, and by taking possession of Calais and enforcing his sovereignty over the narrow seas he rendered the times more favorable for the development of commerce. More than one of the noble families of England have descended from the merchant princes of the 14th century. By this time also the compass, which had been introduced in a rude form as early as the 12th century, had been improved and had come into common use. But many years were to elapse before the enterprise of the 15th and 16th centuries made the most of the new facilities for undertaking long voyages; and the fortunes of English shipping, as depicted by a contemporary (*Libell of Englishe Policy*, 1436), continued to vary according to the state of political connections with the Continent and the success of English monarchs in "keeping the narrow seas" free from the ravages of pirates. During this century, too, we hear far more of organizations of merchants to foreign parts, and of struggles between different bodies of traders. The "Merchants of the Staple" dealt in raw wool and the other staple commodities of the realm, which they exported to Calais; the "Merchant Adventurers," a powerful association which had developed out of a religious guild, dealt chiefly in woollen cloths, but they traded with any port where they could get a footing. This brought them into frequent collision with the "Merchants of the House," who had had a footing in London since before the Conquest. The chief attempt at accommodation took place in the time of Edward IV. (1474), but the quarrels and reprisals continued till the discovery of the New World had revolutionized trade, and the Hanse League, expelled by Elizabeth, were unable either to injure or to compete with English shipping.

Considering the interest which all the Tudor monarchs showed in developing shipping,[1] and the proverbial boldness and enterprise of the Cabots, Raleigh, Drake, and other sailors, it is remarkable that England obtained so little footing at first in the new lands which were discovered by Columbus (1492) or along the route that was opened up by Vasco da Gama (1496). Eventually she inherited much of the commercial empires of Spain, Portugal, Holland, and France, but there was still comparatively little permanent acquisition, or establishment of trading factories, at the close of the 16th century. The fact was that such undertakings were beyond the power of private traders, and that Elizabeth was too penurious to make an attempt on such a scale as to command success. It was by the formation of companies that the difficulty was at length overcome, and that associated traders, or traders working on a joint stock, were able to establish factories in foreign parts, and thus give a new impetus to English shipping. The African Company and others were failures, but there were many which had a long and successful career. The Levant Company was established in 1581 and had factories at Smyrna. The Eastland Company traded with the Baltic; it was established in 1579 and had factories in Prussia. The Hudson's Bay Company is much more recent and only dates from 1670. But by far the greatest of these undertakings was the East India Company, which was founded in 1600, and which, after a long struggle with commercial rivals at home and Dutch competitors abroad, attained at length to the sovereignty of a large empire. The chief cause of complaint against this company in the early stages of its existence lay in the fact that it was a joint-stock company, and that therefore the proprietors had a monopoly of a valuable trade; the greater part of the other companies were regulated companies, and membership was open to any British subject who liked to pay the entrance fees and join with other merchants. The merchants thus associated agreed to abide by certain specified conditions, so as not to spoil the markets for one another, but develop the trade in which all were interested in a manner which should be advantageous to all. The Levant Company and Merchant Adventurers were regulated companies, and they led the attack on the East India Company as the monopoly of a few which injured the trade of other merchants. The controversy raged during the reigns of James I. and Charles I., and many of the leading merchants of the time—Mun, Malynes, Misselden, as well as Wheeler, the secretary of the Merchant Adventurers—took part in it. The advocates of the East India trade argued that, owing to the immense distance of their factories and the special difficulties of maintaining their position abroad, it was impossible to carry on their trade except on the joint-stock principle, and their plea prevailed in the long run.

[1] The establishment of Trinity House by Henry VIII. for looking after pilots, buoys, etc., in 1512, is the most important result of his care for shipping.

The Merchant Adventurers and the whole system of regulated companies is less familiar to us in the present day, and it may be worth while to indicate the sort of regulations which were imposed on the members. One series of rules was directed at regulating the total export trade of certain classes of goods to the chief Continental ports, so that the markets abroad might not be overstocked, and that they might always be able to get remunerative prices. Other regulations allotted the proportion of goods which each member of the company should export, and the terms as to credit and so forth on which he should deal. Each factory was carefully regulated so as to secure a respectable and orderly life among the merchants resident abroad; none of them were to do business during the times of public preaching or on fast-days; and there was a curious administrative system by which the compliance of the members with these regulations was enforced.[1]

Those English merchants who traded to towns where the Adventurers had a factory, but did not comply with their regulations, were stigmatized as "interlopers," and they were greatly disliked by the regular traders, as they were accused of spoiling the market in various ways and, generally speaking, trading on any terms for an immediate advantage without regard to the steady and regular development of commerce. At a later time there were interlopers within the East India Company's territories also.

The formation of these large companies for the purpose of undertaking long voyages marks a great revolution in the shipping of the country. The differentiation of the mercantile and defensive navy became more complete. There had of course been a certain number of royal ships from a very early time (see NAVY), but the fleet had not been regularly maintained in the 15th century, and the defence of the realm was practically left to individuals or associations. As late as the time of Elizabeth we find that the same thing was the case, and that the fleet which harassed the Armada consisted very largely of merchant ships. In the time of the naval wars with Holland, however, this is greatly changed, and the navy was much more effectively organized and regularly maintained. But even when the royal navy was thus organized it was felt that its continued effectiveness must depend on the maintenance of merchant shipping. The two were still interconnected, and just because special importance was attached to this arm as a means of defence there was a great deal of legislation for the purpose of indirectly promoting shipping and providing seamen. This was one of the aspects in which the prosperity of British fisheries was specially attended to; the consumption of fish was stimulated by insisting on the observance of Lent and of weekly fasts on Wednesdays and Fridays, when "the eating of fish was required politically and not spiritually" (5 Eliz. c. 5, § 13, 1 Jas. I. c. 29), and this was principally done as a means of inducing men to take to a seafaring life, and so to fit themselves for the defence of the country and for the manning of our merchant ships.

Considerable progress had also been made both in the art of sailing and in the building of ships. The vessels which composed the fleets of the crusaders appear to have been for the most part galleys, provided with a double row of oars; the huge prows which gave a superiority in hand-to-hand fighting with a grappled vessel were of no advantage when the use of cannon had revolutionized naval warfare. We thus find that the ships of this period were built on a different model, and many inducements were held out to those who built large ships. Both Elizabeth and Charles offered bounties for the building of larger craft (100 and 200 tons); in 1597 800 tons was the largest vessel that an English yard turned out. The legislature also was most assiduous in endeavoring to encourage this industry. The importation of naval stores of all kinds, the growth of hemp for cordage and of timber, were matters of constant care, both in England itself and in the policy which was dictated to her colonies.

It is easy enough to see that in these cases the encouragement of shipping was undertaken as an indirect means of increasing the power of the country, and the same thing is true of the complicated arrangements that were made for giving special inducements to trade in particular articles or with particular countries. Every one is of course familiar with the fact that during the 17th and 18th centuries efforts were made to regulate trade so that gold and silver might be brought into England. It is unnecessary to enumerate the expedients that were adopted at different times, or to discuss the vexed question as to how far those who advocated the system were in error. There can be no doubt that the possession of a treasure was vastly important for political purposes, and that trade was the only means by which a state which possessed no mines could procure treasure; and it is of course possible that some of the mercantilists laid too much stress on the desirability for political purposes of amassing wealth in this form. But the fundamental principle of this system of commercial policy lay in the connection which was felt to exist between trade and industry. Trade, it was said, stimulated industry by providing a new market for its products. If two countries trade together, each will stimulate the trade of the other to some extent, but, if England buys raw products from Portugal and Portugal buys manufactured cloth from England, then the operation of trade between them is such that Portugal stimulates English industry and sets English labor in motion to a far larger extent than English consumption stimulates that of Portugal; it was believed that this relative stimulus might be detected by examining the balance of trade, and that, if by an ingenious adjustment of duties the balance could be kept in her favor, the trade would be benefiting England more than it stimulated the progress of her possible rivals. In the present day we look at the volume of trade and trust that both are gainers; in those centuries they looked at the kind of gain that accrued and tried to ensure that England gained more than her possible enemies. Thus it was generally held that by commercial intercourse between England and France the French gained relatively more than the English; to the legislators of the time it seemed desirable to impose such conditions as should alter this state of affairs, or, if no agreement could be come to on the terms of a treaty, the trade should be stopped altogether, lest by continuing to overbalance England in trade the French should be enabled to overbalance her in power. These ideas of commercial policy dominated the whole of British legislation for shipping[2] from the beginning of the 17th century till after the Napoleonic wars; the preference which was given to English ships, English built and English manned, was enforced in a manner that was prejudicial to the development of the colonies by the Navigation Act of 1651, and was subsequently embodied in the orders in council. But these ideas are expressed most clearly in such discussions as those regarding the Methven treaty with Portugal. Without attempting to advocate a system of which the unwisdom has become patent in our own day, it may yet be worth while to note that it was during this régime that England acquired her position as the great shipping nation of the world, and passed the Dutch and French in the struggle for naval supremacy. Napoleon gave unconscious testimony to the effectiveness of the commercial policy for building up the strength of the nation when he sought to humble England, not by direct attack, but by destroying the trade and shipping by means of which she had raised herself to power.

This policy of subordinating the interests of shipping as a trade and means by which merchants acquired wealth to the policy and power of the nation as a whole had another side. Revenue for war expenses was furnished almost entirely by the mother country; neither Ireland nor the colonies contributed at all largely to the burden of maintaining the national struggle with Continental rivals. Hence it was undesirable that these dependencies should develop at the expense of the mother country, as by so doing they would reduce the fund from which parliament drew for the expenses of the realm. Hence, while England was always willing to develop resources or industries—like the linen trade in Ireland—which did not compete with and could not undersell existing English manufactures, her politicians were unwilling to allow her dependencies to become her competitors in trade so long as they did not coöperate in

[1] Wheeler in Brit. Mus. Add. MS. 18,913.

[2] It was pursued, but less systematically, all through the Tudor reigns or even earlier. Compare 1 H. VII. c. 8, 32 H. VIII. c. 14, 1 El. c. 13, also the Assize of Arms in 1181.

maintaining power. Hence the galling restrictions to which the Irish and the colonists were subjected, both with regard to the development of some of their resources and the carrying on of profitable trade with other colonies or foreign countries. But it must not be forgotten that English merchants suffered in the same sort of way, as changes of political relations at once brought about changes in the conditions of trade, and that, in at least one case the interests of enterprising farmers at home were set aside in favor of protecting an established industry in the colonies. The subordination of the craftsman and trader interest to the public policy of the realm brought about a system of galling regulations which pressed hardly on many persons, though they were most obviously baneful to Ireland and the colonists, who had not so much interest in the political objects for which their wealth was sacrificed.

It is unnecessary to attempt to illustrate in detail the application of these principles; it only remains to add that, whether, in spite of these regulations or because of them, the shipping of England increased vastly during the 18th century. This was partly due to the greater facilities which were granted for procuring capital for trading ventures. In mediæval times a merchant could hardly obtain the command of additional capital, unless by means of a temporary partnership, or loans on bottomry; but the objection to usury was fast giving way, and the public were willing to lend capital and to share in the profits of trading. The practice of trading on borrowed capital, and of obtaining temporary loans from goldsmiths, was common enough all through the 17th century, but the development of the banking system and the new forms of credit which thus became available gave still greater scope to the enterprising shipper. The full fruits of the new power were only shown, however, in the beginning of the 18th century, when the rivalry of the Old and New East India Companies and the story of the Darien Expedition and the South Sea Bubble show how willing the British public were to pour their capital into trading undertakings. Among the companies which were started about this period there were two which have exercised a most salutary influence on British shipping. The Royal Exchange Assurance (6 Geo. I. c. 18) and the London Assurance revolutionized the whole system of marine assurance, and did so much to relieve skippers from the losses they suffered through the risks of commerce as to give considerable encouragement to the business. The plantations were developing into important settlements; the British merchant had outdone his Dutch rivals; and the East India Company was pursuing its course of progress in the East. There can be no wonder that, with so many opportunities for trading, and such new facilities for obtaining capital and assuring against risk, the shipping of the country developed during the 18th century. It is unnecessary to dwell on the shocks it received at the time when the American colonies asserted their independence (27 and 28 Geo. III.) or in the life and death struggle of the Napoleonic wars. The difficulty of recasting the restrictive system under which English merchants plied their trade was very great, and when it broke down in regard to America and Ireland (20 Geo. III. cc. 6, 10) it was becoming apparent that its days were numbered. The doctrines preached by Adam Smith soon began to bear fruit; the practical difficulty of regulating commerce rendered politicians more willing to let it regulate itself; and the controversy between the exclusive companies and the interlopers or independent merchants once more came to the front. It was during the reign of George IV. that the old system was practically abandoned and that the greater part of the old companies were dissolved, and trade to all parts of Africa, to the Levant, and to China became open to all British subjects. The East India Company maintained its position in part despite its many critics for another half century, and the peculiar conditions of the trade of the Hudson's Bay Company have made it desirable to maintain that privileged corporation till the present time.

It became still more obvious that the old policy of regulating the commerce of the country in the supposed interests of its power was being abandoned when Huskisson reformed the tariff in 1825. The measure he succeeded in carrying was not so thoroughgoing as the one he proposed, but its principle was that the customs duties should be levied for revenue objects only, and not with the view of maintaining British merchants in one particular employment of their capital. Later the repeal of the corn laws (1846) and navigation laws (1849) removed the last vestiges of the old commercial policy which had ruled over the development of British shipping almost from the earliest times, but which had been steadily and systematically pursued for three hundred years.

It was thus that Adam Smith's criticisms worked so effectively as to realize his dreams at no great interval of time. His deeper reasons for objecting to the commercial system of the 18th century lay in the fact that the colonial trade and shipping altogether seemed to him to have received an unhealthy stimulus, and that the country would be in a sounder economic position if capital were employed at home in developing native resources, and foreign trade built upon a foundation of highly developed native industry. But the removal of the stimulus did not have the effect he anticipated, or restore the "balance" between industry and shipping. England is far more dependent than ever before on her relations with foreign countries, and therefore on her shipping, for the materials of her manufacture and her food, as well as for markets for her products. She is further removed than ever from that condition of "opulence" which has, according to Adam Smith, the greatest promise of stability and progress.

This has undoubtedly been due to the immense developments in manufacturing in which England, with her wealth of coal and iron, led the way. This reacted on shipping in many ways. England came to be the workshop of the world, and her shipping was freighted with soft goods from Lancashire and Yorkshire, and with hardware and machinery, to be conveyed to the most distant parts of the globe. But not only were the opportunities for trading immensely increased; the application of the steam engine to transit by water has accelerated communication, and rendered it so regular and certain as to give an extraordinary stimulus to foreign trade. The first steamboat that was more than a mere toy made its trial in 1807, and since that time steam shipping has been more and more substituted for the old sailing vessels. Still more recently there has been a considerable change in the construction of ships, from the success which has attended iron shipbuilding. The first experiment, which was generally deemed exceedingly rash, was made in 1851.

It is impossible to get satisfactory data for a comparison of the relative importance of English and foreign shipping for a long period; but it may be assumed that the shipping of the Italian republics and of the Hanse League excelled that of England during the Middle Ages, that in the 16th century Spain was far ahead of her when she could send such fleets to the West and fit out a Spanish Armada, and that in the 17th and 18th centuries respectively England was much in the same position as the great rivals—Holland and France—with which she had to compete so keenly. We may compare the present position and the relative growth of tonnage during the last century, so far as figures are available for the purpose:

	1790.	1880.		1790.	1880.
England[2]	1,511,411	6,574,513	France	...	989,128
Spain	...	557,320	Holland	...	349,000
Italy	...	1,000,000	United States	502,146	4,000,000
Germany	...	1,300,000			

The following aggregates show the growth of the tonnage of British shipping: in 1588, 12,500 tons (excluding fishing boats); in 1770, 682,811 (England and Scotland); in 1791, 1,511,401 (including colonies); in 1830, 2,199,959 (excluding colonies); in 1840, 2,768,262; in 1850, 3,565,133; in 1860, 4,658,687; in 1870, 5,690,789; in 1880, 6,574,513.

SHÍRÁZ, a celebrated city in Persia, capital of Fars, from its site and thoroughly Iranian population may be considered the central point, as it were, of Farsi or Parsi (otherwise Persian) nationality. Owing to the pasture land in its vicinity some derive the name from the native word *shir*, "milk;" others again, asserting the number and physical powers of its inhabitants, accept the same word in its sense of "lion," or take the whole dissyllable as an obsolete word meaning the "lion's paunch." To this effect is cited a local saying to the effect that, "like the lion, it devours all they bring into it." Shíráz is situated in 29° 36′ 30″ N. lat. and 52° 32′ 9″ E. long., in a high plain or valley more than 20 miles long and less than half as broad, and is approached on the south from the sea—a distance of 170 miles[1]—through lofty mountain passes

[1] As the crow flies, it is only 115 miles N.E. by E. of Bushahr.

[2] [For another estimate of British tonnage, see Vol. XVII, p. 299.—AM. ED.]

reaching some 7000 feet above the level of the waters of the Persian Gulf. On the north the approach is also through chains of mountains separating the plains of Shíráz from the valley of the Marv Dasht, intersecting which is the Band Amír river, more poetically than accurately described in *Lalla Rookh*. At Kodiyan, a few miles to the northwest of Shíráz, is the source of another river, which, crossing the high road south of the town under the name of the "Kára Agatch," falls into the sea about 70 miles below Bushahr (Bushire), after a tortuous course of 300 miles. The city has a handsome bazaar and some good private residences; but its unattractive streets are narrow, and, though not so crowded with beggars as Ispahan, contain many living objects distressing to the eye. The mosques and minarets, albeit of local repute, look more picturesque to the stranger in the distance than under close inspection. One fine view of the town is that on the north, at the pass between the mountains called "Allah Hu Akbar"—so named, it is conceived, because this would be the traveller's exclamation of delight when the landscape first opened out upon him. The country in this direction is studded with pleasant gardens. Besides these there are the tombs of the poets Hafiz and Sa'di—both within easy reach of the city. The first—a fine marble monument with a beautifully inscribed ode and other writings upon it—is not a mile from the gate, and is situated in an enclosure bearing the name Háfiziya. The most noted product of Shíráz is its wine, on the merits of which, however, there is much difference of opinion from outside judges. Dr. Wills gives an original account of an experiment of his own in making the wine of Shíráz. Its cost in the production was 5½d. [11 cts.] a bottle, and it sold a year after at more than three times that amount. Shíráz is moreover famous for inlaid work (wood and metal) called *khátam bandi* (from *khátam*, a seal). The population of the city is estimated under 30,000. The ordinary diseases are intermittent fever, diarrhœa, dysentery, typhoid, guinea-worm, cholera, diphtheria, small-pox, and ophthalmia.

Although the praises of Shíráz, its produce, inhabitants, climate, and surroundings of every kind, have been sung by poets for centuries, and are never disputed by Persians who are not Shírázis, yet it is impossible for the sober European traveller to deny that the reality falls far below the picture. We may feel thankful for the wine and the water, the gardens and the monuments, the fruits and the flowers (abundant here as in many other an oasis in the Shah's dominions); we may sympathize with the national pride in the possession of a Hafiz and a Sa'di; we may believe that the ladies of yore had "eyes brighter than the antelope's, hair clustering like their own dark grapes, and forms fairer and sweeter than the virgin rose," and that those of the present day would, if unveiled, strike the spectator with wonder; but one fact remains,—the modern town of Shíráz is not a paradise for those whose personal experience enables them to compare it with the ordinary cities of Europe.

According to Eastern authorities, Shíráz was founded (or refounded, for some accounts ascribe to it a fabulous antiquity) by a brother of the famous Hajjáj about the beginning of the 8th century, or rather by a cousin of Hajjáj called Mohammed b. Kasim b. Abú 'Okail. Six hundred years later it was the capital of the Muzaffar dynasty of princes, when it fell to the arms of Timur. But it attained its greatest reputation in the reign of Karim Khan, who embellished the city greatly and made it the special object of his care. On the downfall of this monarch it was sacked and laid waste by the cruel Agha Mohammed.

Shíráz has been often described by native geographers and European writers of travel. Among the latter may be mentioned Pietro della Valle, Herbert, Tavernier, Deslandes, and Chardin, in the 17th century, and in the present century Ouseley, Porter, Morier, Scott-Waring, Forster, Binning, and many quite recent travellers. Neither in his serious history nor lighter sketches does Sir John Malcolm give any detailed account of Shíráz as a city, but his notes on its climate may be cited. On one of the hottest days of June, 1800, the thermometer registered 94° F. in the house and 100° in a tent. In May, 1810, it never rose at noon above 88° nor fell below 74°. In the morning, at eight o'clock, it generally stood about 60°. In autumn the heat continued, but in winter it was seen to fall considerably below the freezing point. As late as March there is often a hoar frost on the ground. April, he adds, is a delightful month, the thermometer at sunrise being generally from 50° to 55°, at two P.M. 80° to 84°, and at nine P.M. about 64°.

SHIRE. See COUNTY.

SHIRLEY, a town of Hampshire, consists chiefly of comfortable houses occupied by persons in business in Southampton (2 miles southeast), of which it is practically a suburb. Within its limits are the Barlow home (1840), the Ellyet home (1879), and the children's hospital and dispensary for women (1884). The urban sanitary district of Shirley, formed in 1853, was extended by an Act which came into operation 29th September, 1881, the name being also changed to Shirley and Freemantle. The population of the old district (area 1198 acres) in 1871 was 5339 and in 1881 it was 7856. The population of the new district (area 1392 acres) in 1871 was 9909 and in 1881 it was 12,939.

SHIRLEY, JAMES (1596–1666), dramatist, belonged to the great period of our dramatic literature, but, in Lamb's words, he "claims a place among the worthies of this period, not so much for any transcendent genius in himself, as that he was the last of a great race, all of whom spoke nearly the same language and had a set of moral feelings and notions in common." His career of playwriting extended from 1625 to the suppression of stage plays by parliament in 1642. Born in London in 1596, he had been educated for a profession—at Merchant Taylors' school, St. John's College, Oxford, and Catherine Hall, Cambridge. The church was his destination, but he turned Roman Catholic, and made a living for two years as a schoolmaster. His first play, *Love Tricks*, seems to have been accepted while he was teaching at St. Albans, and for eighteen years from that time he was a prolific writer for the stage, producing more than thirty regular plays, tragedies, and comedies, and showing no sign of exhaustion when a stop was put to his occupation by the Puritan edict. He turned again to teaching for a livelihood and prospered, publishing some educational works under the Commonwealth. Besides these he published during the period of dramatic eclipse three small volumes of poems and masques, in 1646, 1653, and 1659. He survived into the reign of Charles II., but, though some of his comedies were revived, he did not again attempt to write for the stage. It is said that he and his second wife died of the fright caused by the great fire of 1666.

There is little original force but much stage-craft and manipulative dexterity in Shirley's plays. He was born to great dramatic wealth, and he handled it freely. It has been remarked that he did not, like some of his great predecessors, take his plots from narrative fiction or history, but constructed them for himself. This is true; but he constructed them out of the abundance of materials that had been accumulated by more originative men during thirty years of unexampled dramatic activity. He did not strain after novelty of situation or character, but worked with confident ease and buoyant copiousness on the familiar lines, contriving situations and exhibiting characters after types whose effectiveness on the stage had been proved by ample experience. He spoke the same language with the great dramatists, it is true, but this grand style appears in him as the mechanical knack of an able and clever workman. It is often employed for the artificial elevation of commonplace thought. "Clear as day" becomes in this manner "day is not more conspicuous than this cunning;" while the proverb "Still waters run deep" is ennobled into:

> The shallow rivers glide away with noise—
> The deep are silent.

But it cannot be denied that he uses the poetic diction of his predecessors with ease, spirit and judgment. His scenes are ingeniously conceived, his characters boldly and clearly drawn; and he never falls beneath a high level of stage effect.

His chief plays were: *Love Tricks*, a comedy, 1625; *The Maid's Revenge*, a tragedy, 1626; *The Brothers*, a comedy, 1626; *The Witty Fair One*, a comedy, 1628; *The Wedding*, a comedy, 1628; *The Grateful Servant*, a tragi-comedy, 1629; *The Changes, or Love in a Maze*, 1632; *The Gamester*, a comedy, 1633; *The Example*, (containing an imitation of Ben Jonson's *Humours*), 1634; *The Opportunity*, 1634; *The Traitor*, a tragedy (perhaps Shirley's best), 1635; *The Lady of Pleasure* (perhaps the best of his comedies), 1635; *The Cardinal*, a tragedy, (an attempt to compete with Webster's *Duchess of Malfi*), 1641. An edition of his works in six volumes, with notes by Dyce and Gifford, was published in 1833.

SHODDY. See Wool.

SHOEMAKING. The simplest foot-protector is the sandal, which consists merely of a sole attached to the foot, usually by leather thongs. The use of this the archæologist can trace back to a very early period; and the sandal of plaited grass, palm fronds, leather, or other material still continues to be the most common foot-covering among Oriental races. Where climate demanded greater protection for the foot, the primitive races shaped a rude shoe out of a single piece of untanned hide; this was laced with a thong, and so made a complete covering. Out of these two elements—sole without upper and upper without sole—arose the perfected shoe and boot, which consist of a combination of both. A collection illustrating the numerous forms and varieties of foot-covering, formed by M. Jules Jacquemart, is now in the Cluny Museum in Paris. It embraces upwards of 300 specimens of ancient, mediæval, and modern times, with a special series illustrating the artistic and historical side of the subject in France from the 15th century, and contains examples of the many varieties of foot-covering in use, especially in the East, at the present day. (Compare Costume.)

Wooden Shoes.—The simplest foot-covering, largely used throughout Europe, is the wooden shoe, made from a single piece of wood roughly cut into shoe form. The towns of Mende and Villefort (dep. Lozère) are the headquarters of the wooden shoe trade in France, about 1700 persons there finding employment in the manufacture. Analogous to this industry is the clog-making trade of the midland counties of England. Clogs, known also as pattens, are wooden soles to which shoe or boot uppers are attached. Sole and heel are made of one piece from a block of maple or ash two inches thick, and a little longer and broader than the desired size of shoe. The outer side of the sole and heel is fashioned with a long chisel-edged implement, called the clogger's knife or stock; a second implement, called the groover, makes a groove about one-eighth of an inch deep and wide round the side of the sole; and by means of a hollower the contour of the inner face of the sole is adapted to the shape of the foot. The uppers of heavy leather, machine sewed or riveted, are fitted closely to the groove around the sole, and a thin piece of leather-binding is nailed on all around the edges, the nails being placed very close, so as to give a firm durable fastening. These clogs are of great advantage to all who work in damp, sloppy places, keeping the feet dry and comfortable in a manner impossible with either leather or india-rubber. They are consequently largely used on the Continent by agricultural and forest laborers, and in England and the United States by dyers, bleachers, tanners, workers in sugar-factories, chemical works, provision packing warehouses, etc. There is also a considerable demand for expensive clogs, with finely trimmed soles and fancy uppers, for use by clog-dancers and others on the stage.

Manufacture of Leather Shoes.—There are two main divisions of work comprised in ordinary shoemaking. The minor division—the making of "turn shoes"—embraces all work in which there is only one thin flexible sole, which is sewed to the upper while outside in and turned over when completed. Slippers and ladies' thin house boots are examples of this class of work. In the other division the upper is united to an insole and at least one outsole, with a raised heel. In this are comprised all classes, shapes, and qualities of goods, from shoes up to long-top or riding boots which reach to the knee, with all their variations of lacing, buttoning, elastic-web side gussets, etc. The accompanying cuts (Figs. 1 and 2) show the parts and trade names of a riding boot, which is the supreme product of the craft.

Till within recent times shoemaking was a pure handicraft; but now machinery effects almost every operation in the art. On the factory system all human feet are treated alike; in the handicraft, the shoemaker deals with the individual foot, and he should produce a boot which for fit, comfort, flexibility, and strength cannot be approached by the product of machinery.

The shoemaker, after measuring the feet, cuts out upper leathers according to the size and pattern. These parts are fitted and stitched together by the "boot-closers;" but little of this closing is now done by hand. The sole "stuff" is next cut out and assembled, consisting of a pair of inner soles of soft leather, a pair of outer soles of firmer texture, a pair of welts or bands about one inch broad, of flexible leather, and lifts and top-pieces for the heels. These the "maker" mellows by steeping in water. He attaches the insoles to the bottom of a pair of wooden lasts, which are blocks the form and size of the boots to be made, fastens the leather down with lasting tacks, and, when dried, draws it out with pincers till it takes the exact form of the last bottom. Then he "rounds the soles," by paring down the edges close to the last, and forms round these edges a small channel or feather cut about one-eighth of an inch in the leather. Next he pierces the insoles all round with a bent awl, which bites into, but not through, the leather, and comes out at the channel or feather. The boots are then "lasted," by placing the uppers on the lasts, drawing their edges tightly round the edge of the insoles, and fastening them in position with lasting tacks. Lasting is a crucial operation, for, unless the upper is drawn smoothly and equally over the last, leaving neither crease nor wrinkle, the form of the boot will be bad. The welt, having one edge pared or chamfered, is put in position round the sides up to the heel or "seat," and the maker proceeds to "inseam," by passing his awl through the holes already made in the insole, catching with it the edge of the upper and the thin edge of the welt, and sewing all three together in one flat seam, with a waxed thread. He then pares off inequalities and "levels the bottom," by filling up the depressed part in the centre with a piece of tarred felt; and, that done, the boots are ready for the outsoles. After the leather for them has been thoroughly condensed by hammering on the "lapstone," they are fastened through the insole with steel tacks, their sides are pared, and a narrow channel is cut round their edges; and through this channel they are stitched to the welt, about twelve stitches of strong waxed thread being made to the inch. The soles are now hammered into shape; the heel lifts are put on and attached with wooden pegs, then sewed through the stitches of the insole; and the top-pieces, similar to the outsoles, are put on and nailed down to the lifts. The finishing operations embrace paring up the edge of the heel, paring, rasping, scraping, smoothing, blacking, and burnishing the edges of soles and heels, scraping, sand-papering, and burnishing the soles, withdrawing the lasts, and cleaning out any pegs which may have pierced through the inner sole. Of course, there are numerous minor operations connected with for-

warding and finishing in various materials, such as punching lace-holes, inserting eyelets, applying heel and toe irons, hob-nailing, etc. To make a pair of common stout lacing boots occupies an expert workman from fourteen to eighteen hours.

The principal difficulties to overcome in applying machinery to shoemaking were encountered in the operation of fastening together the soles and uppers. The first success in this important operation was effected when means other than sewing were devised. In 1809 David Meade Randolph obtained a patent for fastening the soles and heels to the inner soles by means of little nails, etc. The lasts he used were covered at the bottom with plates of metal, and the nails, when driven through the inner soles, were turned and clinched by coming against the metal plates. To fix the soles to the lasts during the operation the metal plates were each perforated with three holes, in which wooden plugs were inserted, and to these the insoles were nailed. This invention may be said to have laid the foundation of machine boot-making. In the following year (1810) the inventor M. I. Brunel patented a range of machinery for fastening soles to uppers by means of metallic pins or nails, and the use of screws and staples was patented by Richard Woodman in the same year.

Apart from sewing by machine or hand, three principal methods of attaching soles to uppers are in use at present. The first is "pegging" with small wooden pins or pegs driven through outsole and insole, catching between them the edges of the upper. The points of the pegs which project through the insole are cut away and smoothed level with the leather either by hand or by a machine pegging rasp. The second is the system of "riveting or clinching" with iron or brass nails, the points of the nails being turned or clinched by coming in contact with the iron last used. The third method, screwing, has come into extensive use since the standard screwing machine was introduced in America by the Mackay Association of Boston, Massachusetts, and in Europe by the Blake & Goodyear Company of London. The standard screw machine, which is an American invention, is provided with a reel of stout screw-threaded brass wire, which by the revolution of the reel is inserted into and screwed through outsole, upper edge and insole. Within the upper a head presses against the insole directly opposite the point of the screw, and the instant screw and head touch the wire is cut level with the outsole. The screw, making its own hole, fits tightly in the leather, and the two soles, being both compressed and screwed firmly together, make a perfectly water-tight and solid shoe. The surface of the insole is quite level and even, and as the work is really screwed the screws are steady in their position, and they add materially to the durability of the soles. The principal disadvantage in the use of standard screwed soles is the great difficulty met with in removing and levelling down the remains of an old sole when repairs are necessary.

The various forms of sewing-machine by which uppers are closed, and their important modifications for uniting soles and uppers, are also principally of American origin. But the first suggestion of machine sewing was an English idea. The patent secured by Thomas Saint in the English Patent Office in 1790, while it foreshadowed the most important features of the modern sewing-machine, indicated more particularly the devices now adopted in the sewing of leather. After the introduction of the sewing-machine for cloth work its adaptation to stitching leather both with plain thread and with heated waxed thread was a comparatively simple task. The first important step in the more difficult problem of sewing together soles and uppers by a machine was taken in the United States by Lyman R. Blake in 1858. Blake's machine was ultimately perfected as the Mackay sole-sewing machine,—one of the most successful and lucrative inventions of modern times. Blake secured his first English patent in 1859, his invention being thus described: "This machine is a chain-stitch sewing-machine. The hooked needle works through a rest or supporting surface of the upper part of a long curved arm which projects upwards from the table of the machine. This arm should have such a form as to be capable of entering a shoe so as to carry the rest into the toe part as well as any other part of the interior of it; it carries at its front end and directly under the rest a looper, which is supported within the end of the arm so as to be capable of rotating or partially rotating round the needle, while the said needle may extend into and through the eye of the looper, such eye being placed in the path of the needle. The thread is led from a bobbin by suitable guides along in the curved arm, thence through a tension spring applied to the arm, and thence upwards through the notch of the looper. The needle carrier extends upwards with a cylindrical block which can be turned around concentrically with it by means of a handle. The feed wheel by which the shoe is moved along the curved arm during the process of sewing is supported by a slider extending downwards from the block, and applied thereto so as to be capable of sliding up and down therein. The shoe is placed on the arm with the sole upwards. The feed wheel is made to rest on the sole." Blake's original machine was very imperfect and was incapable of sewing round the toe of a shoe; but a principal interest in it coming into the hands of Gordon Mackay, he in conjunction with Blake effected most important improvements in the mechanism, and they jointly in 1860 procured United States patents which secured to them the monopoly of wholly machine-made boots and shoes for twenty-one years. On the outbreak of the Civil War in America a great demand arose for boots, and, there being simultaneously much labor withdrawn from the market, a profitable field was opened for the use of the machine, which was now capable of sewing a sole right around. Machines were leased out to manufacturers by the Mackay Company at a royalty of from ½ to 3 cents on every pair of soles sewed, the machines themselves registering the work done. The income of the association from royalties in the United States alone increased from $38,746 in 1863 to $589,973 in 1873, and continued to rise till the main patents expired in 1881, when there were in use in the United States about 1800 Blake-Mackay machines sewing 50,000,000 pairs of boots and shoes yearly. The monopoly secured by the Mackay Company barred for the time the progress of invention, notwithstanding which many other sole-sewing machines were patented. Among the most important of these is the Goodyear & Mackay machines for welted shoes, —the first mechanism adapted for sewing soles on lasted boots and shoes. These machines originated in a patent obtained in 1862 in the United States by August Destory for a curved-needle machine for sewing outsoles to welts, but the mechanism was not successful till taken in hand by Charles Goodyear, son of the well-known inventor in india-rubber fabrics. The Goodyear & Mackay Company make two machines for welted goods, one for sewing the inseam and the second for stitching on the outsole. A large number of the latter form of machine are in use, many manufacturers preferring to secure the welt or a midsole by the standard screw machine, sewing to that the outsole with the Goodyear-Mackay machine. The same company adapt a circular-needle machine to the sewing of turn shoes, and this, with other similar machines, is in extensive use.

The range of machinery used in a well-equipped shoe-factory is very extensive, embracing machines for cutting leather, pressing rollers for sole leather, and presses with cutting-dies for stamping out sole and heel pieces. There are also, in addition to many kinds of sewing-machine, blocking or crimping appliances for moulding uppers or vamps, vamp-folding machines, eyeleting machines, lasting machines, trimming and paring machines for planing and smoothing the edges of soles and heels. For finishing there are scouring, sand-papering, and burnishing machines for the soles, and stamping machines for marks and monograms, with peg-cutting and nail-rasping machines for smoothing, cleaning out, and dressing the surface of the insole. In short there is not a single operation necessary in shoemaking, however insignificant, for which machinery has not been devised.

The manufacture of india-rubber goloshes, shoes, and fishing-boots, etc., forms an important branch of the india-rubber industry rather than a department of shoemaking (see INDIA-RUBBER, vol. xii. p. 883). A very considerable trade exists in boots and shoes with outer soles of gutta-percha (see vol. xi. p. 303) in place of leather, the head-quarters of that trade being in Glasgow. (J. PA.)

SHOES, HORSE. The horny casing of the foot of the horse and other Solidungulates, while quite sufficient to protect the extremity of the limb under natural conditions, is found to wear away and break, especially in moist climates, when the animal is subject to hard work of any kind. This, however, can be obviated by attaching to the hoof a rim of iron—a simple device which has been probably not surpassed in its beneficial effects by the introduction of steam-power locomotion. The animal itself has been in a very marked manner modified by shoeing, for without this we could have had neither the fleet racers nor the heavy and powerful cart-horses of the present day. Shoeing does not appear to have been practiced by either Greeks or Romans; but there is evidence that the art was known to the Celts, and that the practice became common after the overthrow of the Western

empire towards the close of the 5th century. It is only recently that horse-shoeing was introduced in Japan, where the former practice was to attach to the horse's feet slippers of straw, which were renewed when necessary. In modern times much attention has been devoted to horse-shoeing, with the result of showing that methods formerly adopted caused cruel injury to horses and serious loss to their owners. The evils as summarized by Mr. George Fleming, army (British) veterinary inspector, were caused by (1) paring the sole and frog; (2) applying shoes too heavy and of faulty shape; (3) employing too many and too large nails; (4) applying shoes too small and removing the wall of the hoof to make the feet fit the shoes; and (5) rasping the front of the hoof. According to modern principles (1) shoes should be as light as compatible with the wear demanded of them; (2) the ground face of the shoe should be concave, and the face applied to the foot plain; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase foothold; (4) the excess growth of the wall or outer portion of horny matter should only be removed in re-shoeing, care being taken to keep both sides of the hoof of equal height; (5) the shoe should fit accurately to the circumference of the hoof, and project slightly beyond the heel; (6) the shoes should be fixed with as few nails as possible, six or seven in fore-shoes and eight in hind-shoes; and (7) the nails should take a short thick hold of the wall, so that old nail-holes may be removed with the natural growth and paring of the horny matter. Horse-shoes and nails are now made with great economy by machinery. In the rural districts, where the art of the farrier is sometimes combined with blacksmith work, too little attention is, in general, given to considerations which have an important bearing on the comfort, usefulness, and life of the horse.

SHOLAPUR, a British district of India, in the Deccan division of the Bombay presidency, with an area of 4521 square miles, lying between 17° 13′ and 18° 35′ N. lat. and 74° 39′ and 76° 11′ E. long. It is bounded on the N. by Ahmadnagar district, on the E. by the nizam's territory and Akalkot state, on the S. by Kaládgi district and some of the Patvardhan states, and on the W. by Sátára and Poona districts and the states of Phaltan and Panth Pratinidhi. Except in Karmala and Barsi subdivisions, situated in the north and east, where there is a good deal of hilly ground, the district is generally flat or undulating; but it is very bare of vegetation, and presents everywhere a bleak treeless appearance. The chief rivers are the Bhima and its tributaries—the Mán, the Nira, and the Sina—all flowing towards the southeast. Besides these there are several smaller streams. Lying in a tract of uncertain rainfall, Sholapur is peculiarly liable to seasons of scarcity; much, however, has been done by the opening of canals and ponds, such as the Ekrúk and Ashti tanks, to secure a better water-supply. The Great Indian Peninsular Railway enters the district at Pomalvádi in the northwest corner and crosses it in a southeasterly direction, a distance of nearly 150 miles. Sholapur has recently been connected with a branch of the Southern Mahratta Railway.

The population of Sholapur district in 1881 was 582,487 (294,814 males and 287,673 females). Hindus numbered 530,121, Mohammedans 43,967, and Christians 625. There are three towns with populations exceeding 10,000 each, viz., SHOLAPUR (*q.v.*), Pandharpur (16,910), Barsi (16,126). In 1883–84 there were 1,763,340 acres under cultivation, of which 22,282 were twice cropped, besides 325,987 acres of fallow or grass land. Joár, which forms the staple food of the people, occupied 923,706 acres, bajri 298,239, wheat 55,504, rice 25,027, pulses 185,528, and oil-seeds 147,914 acres. The produce of the district finds an easy outlet by the railway to Poona and Bombay. The chief exports are cotton, which comes from the nizam's dominions, oil, oil-seeds, ghi, turmeric, and cotton cloth; imports include salt, piece-goods, yarn, gunny bags, and iron ware. The chief industries are spinning, weaving, and dyeing. The silks and finer sorts of cotton cloth prepared in Sholapur bear a good name; blankets are also woven in large numbers. The gross revenue of the district in 1883–84 amounted to £129,429 [$629,024.94], of which the land-tax yielded £98,963 [$480,960.18].

Sholapur district passed from the Bahmani to the Bijápur kings and from them to the Maráthás. In 1818, on the fall of the Peshwa, it was ceded to the British, when it formed part of the Poona collectorate, but in 1838 it was made a separate collectorate. Since then its progress has been rapid.

SHOLAPUR, chief town and administrative headquarters of the above district, is situated in 17° 40′ 18″ N. lat. and 75° 56′ 38″ E. long., on the plain of the Sina. Its convenient situation between Poona and Haidarábád (Hyderabad), with a station on the Great Indian Peninsular Railway, has made it the centre for the collection and distribution of goods over a large extent of country. The town contained in 1881 a population of 59,890 (males 30,410, females 29,480).

SHOOTING for sporting purposes requires in the use of firearms two fundamental principles on which rests the attainment of dexterity. These are, first, that the weight of the weapon be such that the sportsman can carry and wield it with ease; and, secondly—of still greater importance—that the weapon be so adapted to his chest, arm, and eye that when it is raised and levelled in the act of taking aim it may be as part of his own body. An over-heavy gun may be virtually lightened by being carried by an attendant and only handed to the sportsman when required; but a gun not exactly "fitting the shoulder," cannot possibly serve its uses with accuracy. The reason is plain. The slight divergence of his line of aim from the axis of the barrel, due to the shape of the gun not permitting the coincidence of the two when the weapon is used rapidly, creates a far from slight divergence of the pellets at any range beyond a few yards, and the object fired at, if struck at all, is only struck by the outer and weaker pellets. The increasing wildness of game-birds, in Great Britain at least, especially of partridges, through the modern system of cutting grain close to the ground and so leaving no sheltering stubble, demands rapid aim and discharge of the gun, and in consequence the efforts of gunmakers have been directed to the production of weapons of great lightness combined with power and precision. How different were the conceptions of our immediate predecessors is exemplified in such statements as "a few additional pounds in the weight of a gun makes a deal of difference," and "the most approved guns" are those "weighing, according to the fancy of the shooter, from six to nine pounds." The most approved guns now vary in weight by a few ounces only, and their configuration not by inches, but by eighths and even sixteenths of an inch. There are also fine lines in their modelling which, while of great consequence, are imperceptible to the eye, and can only be demonstrated by the application of exact and delicate instruments. Yet each of these lines has an important purpose, and their combination produces the perfect weapon. An experienced gunsmith who has studied this branch of his business can catch the salient lines of a sportsman's figure with the eye of an artist, and by the further aid of tests and measurements can construct for him a proper gun, and thus lay the foundation of a correct style of shooting. On the other hand, an unsuitable gun can only be aimed correctly with slowness, and by some straining of the muscles of the neck. Under such conditions correct and rapid shooting is at least improbable; the spread of the shot alone prevents a complete miss. It is the correct configuration of the gun which brings into full effect the elaborate boring of the barrel, and gives those long shots of which sportsmen are so proud, and which are due to the central pellets flying straight to a very considerable distance, much beyond that of the outer pellets.

Weight of gun.

The next point in a gun is balance; that is, the metal in the barrels must be so apportioned and the general construction be so arranged that there is no tendency in the muzzle to droop at

Balance.

the moment of discharge, just when the faculties of the sportsman are absorbed in taking aim and his muscular energies are in abeyance. The gun should balance at a point a little in front of the trigger-guard. The centre of gravity should also be low, so that there may be nothing of what may be called "top-hamper,"—in other words, that his gun may not roll in his hand, but may keep on an even keel, as it were, while he is taking aim. If he weigh in the scales two guns of nearly the same weight, the one well the other ill balanced, the former, although feeling quite light in the hand, will generally be found to be really heavier than the latter,—a fact which is frequently the cause of much surprise to sportsmen. When properly balanced, a gun can be carried with much less fatigue.

Calibre. The calibre—a much disputed point—is, within the bounds commonly used, a question more of the capability of the sportsman to carry weight than one touching his effectiveness in the field. It has been plausibly argued that it matters little how narrow the calibre of a fowling-piece is, and that even gauge "35" (.510 inch) is wide enough. It certainly would throw a few pellets of swan-shot effectively, especially if the barrel was not less than 40 inches long. But for all common purposes the most useful calibre is the twelve-bore, if the weight is not under 6¼lb, or somewhat less for hammerless guns. When a less weight is required, "16" gauge (which in breech-loaders is really "15") is preferable. Calibre "20" belongs to toy-weapons, such guns being also uncertain in their delivery; and, as strong and effective "16" double-barrelled guns can now be made weighing only 6lb, a smaller calibre can hardly be required, except under peculiar conditions. Against the advantage of less weight has to be set the important matter of recoil, and one cause of recoil is the elongation of the body of the shot (and especially of the small-sized shot used in such guns) when placed in the barrel or cartridge. The longer that body, and the smaller the shot, the greater the difficulty in starting it; hence, to bring a "20" as regards recoil to an equality with a "12," the weight of the charge of shot must be unduly reduced, with a more than proportionate reduction of the probability of killing, save in the exceptional cases where the size is not larger than snipe shot. The shot in a "12" has no part at any appreciable distance from the wadding over the powder, and every pellet may fairly be said to receive a direct impetus from the explosion. An exceedingly light gun has also the fault of causing unsteadiness when the sportsman takes aim.

Length of barrel. The length of the barrels need not exceed 30 inches. If a sportsman possesses a remarkably correct eye he may safely go down to 26 inches or even less; but it must be borne in mind that the shorter the barrel the greater the necessity for a perfectly correct aim. Any divergence on a barrel under 26 inches is vastly increased at 30 or 40 yards. On the other hand, aim is more quickly taken with short barrels. Thirty inches is a sound medium.

Bore. Of late years there has been a run on what are termed "choke-bores" (see GUNMAKING, vol. xi., p. 248–9). But unless the choking is most mathematically true the flight of the shot will not be coincident with the axis of the barrel or the line of aim, but will "train off" in some oblique direction; and this obliquity will also be more or less affected by any required modification of the charge. A choke-bore, therefore, restricts its user to narrow conditions in loading it. The velocity of the shot is also considerably reduced, the killing power depending less on that than on the object aimed at being struck with a greater number of pellets. Neither do all the pellets fly with equal velocity, so that, as was proved several years ago by ingenious experimentation (first announced by the present writer), these advance, as it were, in a narrow and prolonged column, whereas a properly bored "friction and relief" barrel throws its shot in the figure of a broad disk, with all the pellets travelling practically at the same rate,—the inner or central ones having, however, more sustained killing power, their "quality of motion" being of a higher degree and greatly prolonging the range. A weapon bored on the friction and relief method certainly puts the sportsman in a better position for all kinds of common game at fair sporting ranges; but since the introduction of breech-loaders barrels so bored have (undeservedly) fallen so greatly into disuse that the delicate art of friction and relief boring has nearly been lost. A purely cylindrical barrel only shoots well when perfectly clean,—a condition that every discharge impairs.

Aiming. With a weapon that suits him, the sportsman will find that, on lifting it quickly to his shoulder, keeping both eyes open, and fixing them on any small object at some distance off, the barrels will be directly pointed towards that object without his having taken any slow or exact aim. To verify this, let him keep the gun in position and shut his left eye, when he will find still more plainly that his aim is true. The gun has been so constructed as to bring the rib between the barrels (for double-barrelled guns are always understood) right in front of his line of vision. In other words, the barrels and stock have been so constructed, inclusive of the fine lines already referred to, that, so far as the required purpose is concerned, the whole piece may be said to form an integral part of his own body. A few minutes' daily practice in so pointing a gun at any small object, although in a room, will give the sportsman dexterity in its use even before he has burned powder in it. How the shutting of one eye (unknown in billiards and similar games) in taking aim came to be practiced in using firearms seems inexplicable to those who know how detrimental it is. The keeping of both eyes open was formerly not quite unknown, but was so little practiced that, when the present writer took the matter up some thirty years ago and publicly advocated it, he was looked upon as being quite in error; but now his correctness is acknowledged, and what is termed the "two-eye" system is coming more and more into use. There are still many uncertain "shots" who are not aware that their frequently unaccountable misses are caused by the scientific fact that shutting one eye deprives them of the power of measuring distances, and also of watching the movement of a running or flying object. As a rule, whilst the right eye is actually taking aim, the left is acting subsidiarily and showing the right whether or not it is taking it correctly. It may be noted that almost all exceptionally good shots have the eyes set wide apart, and so take their observation from a broader base.

The attitude in taking aim should be free and upright, with the left foot somewhat advanced. The right elbow should never be raised to a horizontal level with the shoulder,—a common but bad practice. The gun should be lifted directly upwards, the butt-end just grazing the right front of the chest when reaching its final position, the eyes all the while looking fixedly upon the object. To illustrate this by way of contrast, there is another bad style of throwing the gun forward, the shooter all the while trying to look along the rib (which cranes the neck), and then bringing it back against the shoulder before firing. This, however, is a waste of muscular power and quite throws out the adaptation of the stock to the shoulder, because it is impossible to bring back the gun quite correctly, and it has therefore to be readjusted (which can hardly be accomplished) before firing. Besides, all this consumes time, for which game will not tarry. In military phrase, three "motions" are required; with the proper style there is only one.

Use of left hand. The question how far the left hand should be extended in taking aim is much disputed, but is really of secondary consequence. Pigeon-shooters extend it as far as they well can, because their great object is to prevent the muzzle from drooping at the moment of discharge; but from this, and also from their custom of planting their feet firmly and squarely upon the ground, so as to stand with their full front to their probable line of aim, no lesson in shooting game need be taken. Good game shots are not unfrequently poor shots at pigeons, and *vice versa;* to be expert at the former depends upon the acquisition of a certain knack, and above all of calculation in time, i.e., of the power of estimating the average time from the shooter's cry of the word "pull" to the opening of the trap and flight of the bird. This is so much the case that not unfrequently the gun is fired solely by calculation of time, and before a sluggish bird has flown. In game-shooting the bird may rise in front or at either side of the

shooter, or even behind him. Very rapid lateral movement of the gun may therefore be required, and it appears not only probable in itself but experimentally true that this can best be made by the left arm when it has to describe a circle of the shortest diameter. For this the best and safest position is when the left hand grasps the gun immediately in front of the trigger-guard. In pulling the trigger the finger should be well crooked, so that the pressure may be directly backwards, and no lateral disturbance may interfere with the aim at the most critical moment.

Stock of gun.

If the eye takes in all the rib of the gun when raised to the shoulder in position for firing, so that the full length of its surface is seen, the stock is too straight. If the rib is not seen at all, the stock is too crooked. When a stock is of the proper curve, the eye will catch the rib about one-third of its length from the muzzle, *i.e.*, all the rib in front of that point will be visible, and all behind it out of sight. A straight stock is, however, preferable to a crooked one, which makes the gun shoot low,—a bad fault. It is of first-rate importance that the delicate lateral setting of the stock, as distinguished from the perpendicular curve, should bring the centre of the rib exactly into the line of sight. This fine desideratum may be arrived at conjointly by the sportsman and the maker of the gun; the latter can be guided by information as to the sportsman's height, length of arm, and breadth of chest. If this point is satisfactory it is immaterial whether a bird flies to the right hand or to the left, and the neglect of it is the reason why some sportsmen are good shots in only one of these directions.

Treatment of guns.

In cleaning breechloaders, including the inside of the barrels, neither oil nor water should be used, but solely spirits of turpentine. The gun should never be laid aside on full-cock, as this weakens the mainsprings. As hammerless guns are necessarily on full-cock when taken down, the triggers should be drawn, but with the careful proviso that the points of the hammers strike upon a block of hard wood held firmly in front of them. The lock should never be snapped unless there is a discharged or a "dummy" cartridge in the barrel. No hammer can be made, of any metal or form of construction, that will not probably crack if it falls without something in front less trying than the hard and impassive breech. On sea voyages and in damp climates the barrels should be kept from the atmosphere by inserting into them wooden rods covered with woollen cloth, and in such cases the free application of turpentine will be found invaluable. Failing these rods, each end may be closed with wadding or corks. For oiling the locks the finest chronometer oil should be used, and only applied in minute quantities to the points of friction, not over all: oil dries up and if applied copiously frustrates the desired purpose. Raw linseed oil, frequently rubbed into a stock, hardens and preserves it. Explorers and travellers, whose lives may depend on their firearms, may usefully strengthen the weakest part of every gun, the handle of the stock, by wrapping it tightly round with whip-cord.

Shooting Game.—Space forbids entering at length on the modes of shooting the several varieties of game. All that is here possible is briefly to touch upon some of the salient points in the pursuit of the more common varieties.

Rabbits.

Rabbits, on which young sportsmen generally first essay their "'prentice hand," dash off for the nearest shelter with great rapidity, and should be instantaneously fired at, the aim being taken slightly in advance. If a rabbit has disappeared among brushwood, it may be not unavailing to fire right in front of the line it was seen to take. In "ferreting" the sportsman should stand clear of the burrow (over which he should never tread), and never fire at a rabbit until it is well away from the "bolt-hole." Hares are less tenacious of life than rabbits, and, as it is an object not to mangle the body and so cause an effusion of blood, the eyes of the sportsman should be fixed solely on the tips of the ears in whatever direction the animal is going, when the shot is instantaneously fatal. A hare coming straight towards a sportsman should not be fired at; he should stand quite motionless until it comes within 30 yards, when on his making a slight sound or movement it will turn aside and give an easy shot. No other direction need be given on this head (save possibly that the shot is more easy when a hare is ascending a ridge across which it may be running than when it is descending from the crown to the furrow), seeing that the one principle of firing solely at the ears involves everything.

Hares.

Roedeer.

Roedeer are usually killed with buckshot—although a small rifle is preferable—the "guns" being posted at the likely passes. The neck or shoulder should be fired at. They are easily killed when within fair distance, but are exceedingly clever in keeping out of range and in detecting the presence of the lurking sportsman. They also have the trick, in common with the elephant, of doubling back and passing round any knoll, coming out on its other side and then continuing their intended course. Of this instinctive habit the sportsman should avail himself.

Grouse.

Success in grouse-shooting, probably the finest of all sports from every point of view, depends mainly on vigilance and careful attention to the movements of the dogs, and following them well up as soon as there are indications of game being in front. Save that a cunning old cock will after rising immediately dip down to nearly the level of the heather and go off with wondrously baffling speed, there is no peculiarity in the flight of grouse calling for special remark. Like partridges, they generally fly straight and nearly horizontally. As the season advances, their wariness and the matured strength of the young birds make their pursuit more difficult, but otherwise they afford fair shots. "Driving" is now quite a recognized branch of grouse-shooting. The "guns" being posted in artificial places of concealment in the line of flight known to be usually taken by the birds on being disturbed by beaters, the shots are taken as the birds are coming overhead. Their speed is so great that it is needless to fire if they have once passed the shooter, seeing that the aim must be taken some feet in front.[1] It has been found useful for the sportsman to crouch without motion until the birds are coming within distance, when, suddenly showing himself, they are startled and throw their heads up, thus breaking their flight and giving the gun a fair chance. Perhaps the easiest and most fatal shots are at single birds coming straight towards the sportsman, taken at about 30 yards. The aim should be high, and it is aided by the recoil of a gun when fired, which throws the muzzle up in the line of flight. The pellets also strike the head and neck, and with such force that, when meeting the bird, No. 7 shot is most deadly when so discharged. The recoil of a gun when fired "high" is also useful in shooting with a rifle any large bird passing overhead; the shooter should face the bird. Driving is severe work if thoroughly carried out, as the sportsmen, as soon as one beat is over, have to find their way rapidly to the next position. It is therefore not an effeminate sport, and it probably indirectly maintains the number of the stock-birds by killing off the old leading cocks (which virtually are vermin). Setters are the proper dogs for grouse-shooting, their hairy feet being well protected from the heather; hence to maintain vigor they require to drink water frequently and even to squat in shallow pools. Pointers are preferable for dry moors, particularly in hot weather.

Partridges.

Partridge-shooting is akin to grouse-shooting in respect of the mode of pursuit, the difference lying in its being carried on mostly upon cultivated or enclosed land. Both in partridge-shooting and in grouse-shooting one bird only ought to be singled out and shot at; no success will follow firing into the "brown" of a covey. Old sportsmen regret that shooting over dogs (pointers being preferable to the swifter and more dashing setters) is going out of practice; but the close cutting of the grain crops now in vogue leaves so little stubble that the approach of the dogs is seen by the birds, which, generally rising wild, afford few "shots to points." Hence the system of sportsmen walking in line (with no dogs save retrievers) and taking what birds rise before them, and so driving them into turnips or other covert, or of having them "driven" by beaters, is almost enforced. When driven into such coverts the birds are apt to run before the shooters and take their flight from the far end of the field. This may be prevented by the sportsman not advancing directly, but in a series of circuits; then the birds, becoming uncertain as to which way they should run, sit close and only rise on his very near approach. Of course this excellent but almost unknown system can only be well carried out by a single shooter, or by two at the most. In "driving" the "guns" are posted in a line at some distance from each other, under the concealment of a hedge some 20 yards in their front. Towards this the beaters (with a fugleman on horseback, if necessary) drive the birds. The shots are generally very difficult, the birds flying with remarkable speed, and the shooter being also often bewildered by the number of smaller birds, such as the various kinds of thrushes, which precede or accompany the partridges; their sudden appearance on coming over the

[1] A carrier pigeon can fly a little over 4 miles 5 furlongs in four minutes,—an average of nearly 102 feet a second. Assuming the distance to be 40 yards (a long shot), the aim taken at a bird flying across the shooter at that speed should be more than 5 feet in advance, the flight of the shot to a distance of 40 yards requiring one-nineteenth of a second.

hedge is also trying, whereas the approach of grouse can be seen. These two systems—"driving" and the circular progression in covert—are of recent introduction. The former has developed greater skill in shooting.

Pheasants.

The art of shooting pheasants depends upon the fact that, unlike partridges or grouse, the birds generally steadily ascend in their flight; hence the tendency is to shoot under them. This upward flight is greatest in coverts, until it sometimes becomes almost perpendicular, birds rising in this way being called "rocketers." The inexperienced shooter is also misled by the manner in which the tail is spread out like a fan, concealing the body, and thus diverting the aim from the body upon the tail feathers. To aim high, therefore, is the golden rule. The shooter should face birds which fly rapidly overhead, in the way described above.

Snipe.

To kill snipe well one must hunt down the wind—an exceptional practice—and on the bird rising fire at once, or, failing that, give it time to change its few preliminary zigzag motions into a steady flight. As the least touch of shot brings a snipe down, it is very unlikely to have passed out of range before the direct line of flight is assumed. This is the only sport followed on land "down wind." Shot No. 9 or 10 should be used.

Black cock and woodcock.

Although greatly different in character, black-game and woodcock may be well coupled together as being eccentric in their movements. The former are most easily shot very early in the season, especially over a steady old pointer, when the broods are yet on the more open ground, under the maternal charge, like so many domestic chickens; but, when they have broken up the family ties, congregated, and betaken themselves to the coppices, they become so irregular in their habits and uncertain in their mode of taking flight that no exact rules can be laid down for their pursuit. The sportsman, using one steady old pointer and a retriever, had best be guided by an experienced attendant, who should take care to beat out any bird lurking in a thick bush from the opposite side and towards the gun. A few shots may also be got at the dawn of day on the edges of stubble-fields; but black-game shooting is generally disappointing. The female birds, "gray hens," are not shot at; the young males, which greatly resemble them, are distinguished from them by the white feathers in the tail. A solitary blackcock may often be seen to take up a prominent position, usually in the centre of one of the small fields to be found on the side of hilly ground, where he maintains a vigilant watch. With some experience in shooting matters, the present writer knows no pursuit more interesting and invigorating than stalking such a bird: without causing undue fatigue, it exercises one's patience, vigilance, and coolness of nerve. Shot for this purpose should not be of a smaller size than No. 4. Woodcock newly arrived may be readily killed, especially near the sea-coast. After recruiting, they frequently betake themselves to heathery moors if there are such near at hand, where they frequent the sides of rivulets and gorges. There they may be readily brought down; but in the woods they have a knack of twisting, as it were, round the younger trees, in the branches of which they are mostly found, and so disconcert the aim. Being of nocturnal habits, their eyes are weak in the full glare of day, and they are fond of the sheltering shade of thickly foliaged trees such as the holly. The only advice that can be given on this sport is to risk the shot at the merest glimpse of the bird through the branches, and trust to the spread of the pellets to kill, for the woodcock, like its congener the snipe, will fall with a touch, and even (apparently) through mere fright on being fired at, without being touched at all. The best shot to use is No. 8.

Ammunition.

Ammunition.—In former times sportsmen carefully adjusted their charges of powder and shot to suit the weather (which affected the strength of the former) and the sport in hand. Now, almost everything is left to the purveyor of cartridges, which are usually charged on average proportions. The sportsman should be careful, therefore, to ascertain the charge best suited to his weapon, and to have his cartridges so loaded. When a gun recoils the charge of shot—not of powder, as is generally supposed—should be reduced; and it is always safer to use a light charge of shot. Breech-loaders require large-grained powder, Messrs. Curtis & Harvey's No. 6 being the typical size. Pyroxyline explosives, of which Schultze powder[1] is the normal type, are now largely used, especially in the first barrel, the other being charged with black powder. For almost all regular sport No. 6 shot is the best size; and it is better to use No. 7 in a smaller quantity than No. 5 for grouse and partridges. For pheasants and black-game use No. 5, but of 1¼ oz. in weight, with a somewhat reduced charge of powder. One oz. or at most 1⅛ oz. of No. 6 is ample; the former will travel with marvellous and far-reaching velocity. Any excess of shot merely falls to the ground, as may be seen by firing over a sheet of smooth water. For duck-shooting (for which the barrels should be of "10" gauge and 32 inches long) No. 4 shot is a good size; and for this sport it is well to reduce the weight of the shot and increase very considerably that of the powder, velocity being everything.

Rifle-shooting.

Rifle-shooting.—The propriety of shooting with both eyes open is, if possible, more imperative in rifle-shooting than in shooting game, if rapidity is valued, as it must be. Firearms immediately followed the long bow and the cross-bow, and it has never been supposed that the archer discharged these with one eye closed. With both eyes open the "back sight" virtually becomes transparent, and forms no obstacle to the aim, while with one eye closed it certainly does, for, as the head and eyes must be kept fairly up in firing a shot gun, they must be kept well down in firing a rifle. The "express" rifle is the *chef-d'œuvre* of modern weapons, and when properly made will throw its bullet up to 200 yards without perceptible curve from one sight. This result is attained mostly by an inordinately large charge of powder to a light and partly hollow bullet (see GUNMAKING, vol. xi. p. 249). The "pull" on the trigger should rather be a pinch than a direct backward pull, *i.e.*, the trigger should be pinched between the forefinger and the thumb, which grasps the handle of the stock. If the sportsman has the presence of mind to inflate his chest with a long inhalation he will shoot all the better. There is a popular opinion that a single-barrelled "express" shoots more truly than a double-barrelled one. This is quite a mistake, unless the barrel of the former is made so thick and heavy at the muzzle (to prevent the metal quivering when the bullet leaves it) as to destroy the balance. In double-barrelled rifles the one barrel braces up the other, and they are also so adjusted as to shoot parallel. This common error has probably arisen from confounding "express" with long-range match rifles, which are quite another thing. The .450 calibre is best adapted for deer and antelopes, .500 for mixed shooting, and .577 for dangerous animals. But for these and the great pachyderms a "12" gauge throwing an explosive shell, is the most effective of all firearms, the larger "area" of the wound telling at once.

All really useful information on the subject of shooting is contained in J. D. Dougall's *Shooting, its appliances, etc.*, (London, 2d. ed., 1881); General W. N. Hutchinson's *Dog-breaking* (London, 1876); and W. Scrope's *Deer-stalking* (London, 1846). (J. D. D.)

SHORE, JANE, mistress of King Edward IV., would have been unknown by name even to the studious antiquary but for the events which took place after the death of her royal paramour. She was the first of three concubines whom he described respectively as the merriest, the wilyest, and the holiest harlot in his realm. A handsome woman of moderate stature, round face, and fair complexion, she was more captivating by her wit and conversation than by her beauty; yet Sir Thomas More, writing when she was still alive, but old, lean, and withered, declares that even then an attentive observer might have discerned in her shrivelled countenance some traces of its lost charms. She was born in London, and married before she was quite out of girlhood to a citizen named William Shore, who, though young, handsome, and well-to-do, never really won her affections; and thus she yielded more readily to the solicitations of King Edward. Her husband on this abandoned her, and after Edward's death she became the mistress of Lord Hastings, whom Richard III., then duke of Gloucester, as protector during the minority of Edward V., suddenly ordered to be beheaded on 13th June, 1483. According to the report given by More, Richard had accused Hastings at the council table of conspiring against him along with the queen-dowager and Shore's wife, who by sorcery and witchcraft had given him a withered arm. So having got rid of

[1] This explosive is the invention of Colonel J. F. E. Schultze, of the Prussian artillery service, and was introduced about 1866 into the United Kingdom, by Mr. J. D. Dougall. It is now being manufactured in Great Britain as well as on the Continent. The advantages claimed for it are that it does not require any special loading, such as hard ramming, there is a smaller recoil than with black gunpowder, and it has a great propulsive power, with little or no fouling of the firearm.

Hastings he caused Jane Shore to be committed to prison and spoiled her house, containing property to the value of 2000 or 3000 marks, equivalent to a sum of £20,000 or £30,000 [$97,200 or $145,800] at the present day. But having sought in the first place to charge her with conspiracy—a charge which apparently he could not substantiate—he thought better afterwards to get the bishop of London to put her to open penance at Paul's Cross for her vicious life. She accordingly went in her kirtle through the streets one Sunday with a taper in her hand, her beauty really enhanced by the blush which her humiliation called up in her usually pale cheeks; and many who detested her mode of life could not but pity her as the victim of a hypocritical tyranny. The penance certainly did not induce her to reform, for she immediately afterwards became the mistress of the marquis of Dorset; and, what is still more extraordinary, next year, having been taken again into custody, and her husband, it may be presumed, being by that time dead, she so captivated the king's solicitor, Thomas Lynom, that he actually entered into a contract of marriage with her. This we know from a letter of King Richard to his chancellor on the occasion, desiring him to dissuade Lynom from the match, as far as he could, by argument, but, if he found him determined, then, provided it was not against the laws of the church, he might convey the king's consent and meanwhile deliver Jane out of prison to her father's custody. Conduct so unlike his previous severity shows that Richard knew how to be gracious as well as despotic. Whether the marriage actually took place is not known. Jane certainly lived to the year 1513, when More wrote his history of Richard III., but how much later we cannot tell.

SHORTHAND, or STENOGRAPHY, TACHYGRAPHY, etc., is a term applied to all systems of brief handwriting which are intended to enable a person to write legibly at the rate of speech. (For the ancient Latin and Greek tachygraphy, see the last part of the article on PALÆOGRAPHY.) In the 10th century all practical acquaintance with the shorthand systems of Greece and Rome faded completely away, and not till the beginning of the 17th can the art be said to have revived. But even during that interval systems of writing seem to have been practiced which for speed approximated to modern shorthand.[1]

Shorthand in English-speaking Countries.—England was the birthplace of modern shorthand, and at the present time there is no country in Europe, except, perhaps, Germany and German Switzerland, where the art is so extensively practiced as in England. The first impulse to its cultivation may possibly be traced to the Reformation. When the principles of that movement were being promulgated from the pulpit, a desire to preserve the discourses of the preacher naturally suggested the idea of accelerated writing. It is certainly striking that in the early systems so many brief arbitrary signs are provided to denote phrases common in the New Testament and Protestant theology. Up to the present time (1886) not less than 483 professedly distinct systems of English shorthand have been published, and doubtless many more have been invented for private use. It is impossible here to notice even by name more than a very few of them. Indeed, if we reject all those systems which are imitations or reproductions of earlier ones, and systems which are so unpractical as to be little better than elegant toys, and a multitude of utterly worthless catchpenny publications, only a few remain. In Dr. Timothy Bright's[2] *Characterie* (1588) and Peter Bales's[3] *Arte of Brachygraphie*, contained in his *Writing Schoolemaster* (1590), almost every word in the language is provided with an arbitrary sign. Only with gigantic memory and by unremitting labor could one acquire a practical knowledge of such methods. The first shorthand system worthy of the name which, so far as is known, appeared in England is that of John Willis, whose *Art of Stenographie* (London, 13 editions[4] from 1602 to 1644) is substantially based on the common alphabet; but the clumsiness of his alphabetic signs, and the confused laborious contrivances by which he denotes prefixes and terminations, involving the continual lifting of the pen, would seem to render his method almost as slow as longhand. Of the 201 systems which intervene between J. Willis's and Isaac Pitman's phonography (1837) nearly all are based, like Willis's, on the alphabet, and may be called a, b, c systems. But seven are, like phonography, strictly phonetic, viz., those by Tiffin (1750), Lyle (1762), Holdsworth and Aldridge (1766), Roe (1802), Phineas Bailey (1819), Towndrow (1831), and De Stains (1839). Of the 281 systems which have appeared since phonography a very large proportion are merely imitations of that system, or proceed on the same lines.

A few general remarks apply largely to all the a, b, c systems. Each letter is designated by a straight line or curve (vertical, horizontal, or sloping), sometimes with the addition of a hook or loop. *C* and *q* are rejected, *k* being substituted for hard *c* and *q*, *s* for soft *c*. Signs are provided for *ch*, *sh*, *th*. *G* and *j* are classed under one sign, because in some words *g* is pronounced as *j*, as in *giant*, *gem*. Similarly each of the pairs *f*, *v* and *s*, *z* has only one sign. A few authors make the signs for *j*, *v*, *z* heavier than those for *g*, *f*, *s*. Some class *p* and *b*, *t* and *d*, each under one sign. The stenographic alphabet is, therefore.—*a*, *b*, *d*, *e*, *f* (*v*), *g* (*j*), *h*, *i*, *k*, *l*, *m*, *n*, *o*, *p*, *r*, *s* (*z*), *t*, *u*, *w*, *x*, *y*, *ch*, *sh*, *th*. Letters which are not sounded may be omitted. *Gh*, *ph* may be counted as *f* in such words as *cough*, *Philip;* but the *th* in *thing* is never distinguished from the *th* in *them*. Thus the a, b, c systems are largely phonetic with respect to consonant-sounds; it is rather with regard to the vowels that they disregard the phonetic principle. No attempt is made to provide adequately for the many vowel-sounds of the language. Thus the signs for *like* and *lick*, for *rate* and *rat*, etc., are the same. In the case of vowel-sounds denoted by two letters, that vowel is to be written which best represents the sound. Thus in *meat* the *e* is selected, but in *great* the *a*. In some a, b, c systems, including the best of them (Taylor's), a dot placed anywhere does duty for all the vowels. This practice is, of course, a fruitful source of error, for *pauper* and *paper*, *gas* and *goose*, and hundreds of other pairs of words would according to this plan be written alike. In the early systems of Willis and his imitators the vowels are mostly written either by joined characters or by lifting

A, b, c systems.

[1] For instances, see Zeibig's *Geschichte u. Lit. der Geschwindschreibkunst* (Dresden, 1878), pp. 67-79. For John of Tilbury's system (c. 1175), see especially *Shorthand*, No. 5, and *Hermes*, viii. p. 303.

[2] The Bodleian Library contains the only known copy of Bright's book. For a description of the system, see *Phonetic Journal*, 1884, p. 86; *Circulars of Information of the Bureau of Education* (Washington), No. 2, 1884, p. 8; and *Notes and Queries*, 2d ser., vol. ii. p. 394. *A* is represented by a straight line, the other letters of the alphabet by a straight line with a hook, circle, or tick added at the beginning. Each alphabetic sign placed in various positions, and having some additional mark at the end, was used to indicate arbitrarily chosen words beginning with *a*, *b*, *c*, *d*, etc. There were four slopes given to each letter and twelve ways of varying the base, so that forty-eight words could be written under each letter of the alphabet if necessary. Thus the sign for *b* with different terminal marks and written in four different directions signified a number of words commencing with *b*; 537 such signs had to be learned by heart. By adding certain external marks these signs were applied to other words: thus by writing a dot in one of two positions with respect to a sign the latter was made to represent either a synonym or a word of opposite meaning. Under *air* are given as synonyms *breath*, *exhalation*, *mist*, *reek*, *steam*, *vapor*. The best account of Bright is given in the *Dictionary of National Biography*, vol. vi. (1886).

[3] Bales's method was to group the words in dozens, each dozen headed by a Roman letter, with certain commas, periods, and other marks to be placed about each letter in their appropriate situations, so as to distinguish the words from each other. For an account of Bales, see Wood's *Athen. Oxon.*, vol. i. col. 655, and the *Dict. of Nat. Biog.*, vol. iii. (1885).

[4] The first edition, published anonymously, is entitled *The Art of Stenographie . . . wherevnto is annexed a very easie Direction for Steganographie, or Secret Writing*, printed at London in 1602 for Cuthbert Burbie. The only known copy is in the Bodleian Library.

the pen and writing the next consonant in a certain position with respect to the preceding one. Both these plans are bad; for lifting the pen involves expenditure of time, and vowels expressed by joined signs and not by marks external to the word cannot be omitted, as is often necessary in swift writing, without changing the general appearance of the word and forcing the eye and the hand to accustom themselves to two sets of outlines, vocalized and unvocalized. In the better a, b, c systems the alphabetic signs, besides combining to denote words, may also stand alone to designate certain short common words, prefixes, and suffixes. Thus in Harding's edition of Taylor's system the sign for *d*, when written alone, denotes *do*, *did*, the prefixes *de-*, *des-*, and the terminations *-dom*, *-end*, *-ened*, *-ed*. This is a good practice if the words are well chosen and precautions taken to avoid ambiguities. Numbers of symbolical signs and rough word-pictures, and even wholly arbitrary marks, are employed to denote words and entire phrases. Symbolical or pictorial signs, if sufficiently suggestive and not very numerous, may be effective; but the use of "arbitraries" is objectionable because they are so difficult to remember. In many shorthand books the student is recommended to form additional ones for himself, and so, of course, make his writing illegible to others. The *raison d'être* of such signs is not far to seek. The proper shorthand signs for many common words were so clumsy or ambiguous that this method was resorted to in order to provide them with clearer and easier outlines. For the purpose of verbatim reporting the student is recommended to omit as a rule all vowels, and decipher his writing with the aid of the context. But, when vowels are omitted, hundreds of pairs of words having the same consonant skeleton (such as *minister* and *monastery*, *frontier* and *furniture*, *libel* and *label*) are written exactly alike. This is one of the gravest defects of the a, b, c systems.

John Willis's system was largely imitated but hardly improved by Edmond Willis (1618), T. Shelton (1620), Witt (1630), Dix (1633), Mawd (1635), and Theophilus Metcalfe (1635). T. Shelton's system, republished a great many times down to 1687, was the one which Samuel Pepys used in writing his diary.[1] It was adapted to German, Dutch, and Latin.[2] An advertisement of Shelton's work in the *Mercurius Politicus* of 3d October, 1650, is one of the earliest business advertisements known. The book of Psalms in metre (206 pages, $2\frac{3}{8}\times1\frac{1}{2}$ inches) was engraved according to Shelton's system by Thomas Cross. Metcalfe's *Radio-Stenography*, or *Short-Writing*, was republished again and again for about a hundred years. The 35th "edition" is dated 1693, and a 55th is known to exist. The inefficiency of the early systems seems to have brought the art into some contempt. Thus Thomas Heywood, a contemporary of Shakespeare, says in a prologue[3] that his play of *Queen Elizabeth*

John Willis.

> "Did throng the seats, the boxes and the stage
> So much that some by stenography drew
> A plot, put it in print, scarce one word true."

Shakespeare critics would in this manner explain the badness of the text in the earliest editions of *Hamlet*, *Romeo and Juliet*, *Taming of the Shrew*, *Merry Wives of Windsor*, and *Henry V.* Perhaps a study of J. Willis's system and of E. Willis's (which, though not published till after Shakespeare's death, was practiced long before) may shed light on corrupt readings of the text of these plays.[4] Rich's system (1646, 20th edition 1792) was reproduced with slight alterations by many other persons, including W. Addy, Stringer, and Dr. Philip Doddridge (1799 and three times since). The New Testament and Psalms were engraved in Rich's characters (1659, 596 pages, $2\frac{1}{2}\times1\frac{1}{2}$ inches, 2 vols.), and Addy brought out the whole Bible engraved in shorthand[5] (London, 1687, 396 pp.). Locke, in his *Treatise on Education*, recommends Rich's system; but it is encumbered with more than 300 symbolical and arbitrary signs. In 1847 it was still used by Mr. Plowman, a most accomplished Oxford reporter.

Rich.

In 1672 William Mason, the best shorthand author of the 17th century, published his *Pen pluck'd from an Eagle's Wing*. The alphabet was largely taken from Rich's. But in his *Art's Advancement* (1682) only six of Rich's letters are retained, and in his *Plume Volante* (1707) further changes are made. Initial vowels are written by their alphabetic signs, final vowels by dots in certain positions (*a*, *e* at the beginning; *i*, *y* at the middle; *o*, *u* at the end), and medial vowels by lifting the pen and writing the next consonant in those same three positions with respect to the preceding one. Mason employed 423 symbols and arbitraries. He was the first to discover the value of a small circle for *s* in addition to its proper alphabetic sign. Mason's system was republished by Thomas Gurney in 1740, a circumstance which has perpetuated its use to the present day, for in 1737 Gurney was appointed shorthand-writer to the Old Bailey, and early in the 19th century W. B. Gurney was appointed shorthand-writer to both Houses of Parliament. Gurney reduced Mason's arbitraries to about a hundred, inventing a few specially suitable for parliamentary reporting. The Gurneys were excellent writers of a cumbrous system. Thomas Gurney's *Brachygraphy* passed through at least eighteen editions, but the sale of the book has now almost ceased.

Mason.

In 1767 was published at Manchester a work by John Byrom, sometime fellow of Trinity College, Cambridge, entitled *The Universal English Shorthand*, distinguished for its precision, elegance, and systematic construction. Byrom had died in 1763. Having lost his fellowship by failing to take orders, he made a living by teaching shorthand in London and Manchester, and among his pupils were Horace Walpole, Lord Conway, Charles Wesley, Lord Chesterfield, the duke of Devonshire, and Lord Camden. Shorthand, it is said, procured him admission to the Royal Society. He founded a stenographic club, to the proceedings of which his journal,[6] written in shorthand, is largely devoted. In the strangers' gallery of the House of Commons in 1728, Byrom dared to write shorthand from Sir R. Walpole and others. In 1731, when called upon to give evidence before a parliamentary committee, he took shorthand notes, and, complaints being made, he said that if those attacks on the liberties of shorthand men went on he "must have a petition from all counties where our disciples dwell, and Manchester must lead the way." Thomas Molyneux popularized the system by publishing seven cheap editions between 1793 and 1825. Modifications of Byrom's system were issued by Palmer (1774), Nightingale (1811), Adams (1814), Longmans (1816), Gawtress (1819), Kelly (1820), Jones (1832), and Roffe (1833). Byrom's method received the distinction of a special Act of Parliament for its protection (15 Geo. II. c. 23, for twenty-one years from 24th June, 1742). To secure lineality in the writing and facility in consonantal joinings he provided two forms for *b*, *h*, *j*, *w*, *x*, *sh*, *th*, and three for *l*. *A*, *e*, *i*, *o*, *u*, be represented by a dot in five positions with respect to a consonant. Practically it is impossible to observe more than three (beginning, middle, and end). With all its merits, the system lacks rapidity, the continual recurrence of the loop seriously retarding the pen.

Byrom.

[4] See M. Levy's *Shakspere and Shorthand* (London), and *Phonetic Journal*, 1885, p. 34.

[5] This curiosity is described in the *Phonetic Journal*, 1885, pp. 158, 196. The Bodleian Library has a copy.

[6] Byrom's private journal and literary remains have been published by the Chetham Society of Manchester. See, too, a paper by J. E. Bailey in the *Phonetic Journal*, 1875, pp. 109, 121.

In 1786 was published *An Essay intended to establish a Standard for a Universal System of Stenography*, by Samuel Taylor (London). This system did more than any of its predecessors to establish the art in England and abroad. Equal to Byrom's in brevity, it is simpler in construction. No letter has more than one sign, except *w*, which has two. Considering that five vowel places about a consonant were too many, Taylor went to the other extreme and expressed all the vowels alike by a dot placed in any position. He directs that vowels are not to be expressed except when they sound strong at the beginning and end of a word. Arbitraries he discarded altogether; but Harding, who re-edited his system in 1823, introduced a few. Each letter when standing alone represents two or three common short words, prefixes and suffixes. But the list was badly chosen: thus *m* represents *my* and *many*, both of them adjectives, and therefore liable to be confounded in many sentences. To denote *in* and *on* by the same sign is evidently absurd. Taylor's system was republished again and again. The latest editions are those of J. H. Cooke (London, 1865), and A. Janes (London, 1882). In Harding's edition (1823 and at least twelve times since) the vowels are written on an improved plan, the dot in three positions representing *a*, *e*, *i*, and a tick in two positions *o*, *u*. Several other persons brought out Taylor's system, in particular G. Odell, whose book was re-edited or reprinted not less than sixty-four times, the later republications appearing at New York. The excellence of Taylor's method was recognized on the Continent: the system came into use in France, Italy, Holland, Sweden, Germany, Portugal, Roumania, Hungary, etc. In England at the present day no method excepting Pitman's phonography is more popular than Taylor's, although the systems which have appeared since Taylor's are far more numerous than those which preceded it.

Taylor.

The *Universal Stenography* of William Mavor (1780 and nine times since) is a very neat system, and differs from Taylor's in the alphabet and in a more definite method of marking the vowels. *A*, *e*, *i*, are indicated by commas, *o*, *u*, *y*, by dots, in three places with respect to a letter, namely beginning, middle, and end. Other systems by J. H. Lewis (1812) and Moat (1833) are still used to a small extent.

Mavor

The vast mass of a, b, c systems are strikingly devoid of originality, and are mostly imitations of the few that have been mentioned. Nearly all may be briefly described as consisting of an alphabet, a list of common words, prefixes and suffixes expressed by single letters, a list of arbitrary and symbolical signs, a table showing the best way of joining any two letters, a few general rules for writing, and a specimen plate.[1]

Pitman's phonography, on account of its enormous diffusion in Great Britain and the colonies, and in America, its highly organized and original construction, and its many inherent advantages, merits a more extended notice than has been given to the systems already mentioned. In 1837 Isaac Pitman, then teacher of a British school at Wotton-under-Edge and an excellent writer of Taylor's system, composed at the invitation of Samuel Bagster a short stenographic treatise of his own, which Bagster published under the title of *Stenographic Sound-Hand*. The price was fixed at fourpence, for the author had determined to place shorthand within the reach of everybody. He had won the friendship of the Bible publisher by voluntarily verifying the half a million references in the *Comprehensive Bible*, and Mr. Bagster for nine years published Mr. Pitman's shorthand books. In 1840 a second edition appeared in the form of a penny plate bearing the title *Phonography*, the principal feature of the system being that it was constructed on a purely phonetic basis. The name of Bagster helped the enterprise, and the author was indefatigable in spreading the knowledge of his system by lectures and gratuitous teaching through the penny post, then just established. In December, 1841, the first number of what is now known as the *Phonetic Journal* appeared at Manchester in a lithographed form. It was then called the *Phonographic Journal*, and subsequently in turn the *Phonotypic Journal*, the *Phonetic News*, and the *Phonetic Journal*. The chief instruction books issued by the author at the present time from his press at the Phonetic Institute, Bath, are the *Phonographic Teacher*, a little sixpenny book for beginners, of which 1,030,000 copies have been published; the *Manual of Phonography* (470th thousand), in which the art is sufficiently developed for the purpose of correspondence, private memoranda, and easy reporting; and the *Phonographic Reporter* (133d thousand). The weekly circulation of the *Phonetic Journal* is about 20,000 copies. A part of it is printed in the phonographic character from movable types. The system has been warmly taken up in America, where it has been republished in more or less altered forms, especially by the author's brother Benn Pitman, and by Messrs. A. J. Graham, J. E. Munson, E. Longley, and Eliza B. Burns. A large number of periodicals lithographed in phonography are published in England and America. The *Shorthand Magazine*, monthly, has existed since 1864. Of standard English books printed or lithographed in phonography may be mentioned, besides the Bible, New Testament, and Prayer Book, *The Pilgrim's Progress*, *The Vicar of Wakefield*, *Pickwick Papers*, *Tom Brown's School Days*, Macaulay's *Essays* and *Biographies*, *Gulliver's Travels*, Blackie's *Self-culture*, Bacon's *Essays*, and a long list of tales and selections. Numerous societies have been formed in all English-speaking countries for the dissemination of phonography. The largest is the Phonetic Society with 3350 members, who have all certificates of a knowledge of the art and engage to teach through the post gratuitously. Most important towns in the United Kingdom have a phonographic association. London has three. Phonography has been adapted to several foreign languages, but not so successfully as Gabelsberger's German system. Mr. T. A. Reed's *French Phonography* (1882) is intended only for English phonographers who wish to report French speeches. Other adaptations to French are by A. J. Lawson and J. R. Bruce. A society for the adaptation of phonography to Italian was organized at Rome in 1883 by G. Francini, who has published his results (Rome 1883, 1886). Phonography adapted to Spanish by Parody (Buenos Ayres, 1864) is practiced by half the stenographers employed in the senate and chamber at Buenos Ayres. It has been adapted to Welsh by R. H. Morgan (Wrexham, 1876), and to German by C. L. Driesslein (Chicago, 1884). Phonography is steadily driving all other English systems out of the field. Mr. T. A. Reed stated in the *Phonetic Journal*, 1883, p. 62, that of the 61 writers employed by the *Times*, *Standard*, *Telegraph*, *Morning Post*, and the Press Association 31 were using phonography, 18 Taylor's, 5 Gurney's (*i.e.*, Mason's), 4 Lewis's, and 3 other systems; of the 67 members composing the Institute of Shorthand Writers, chiefly practitioners in the law courts, 26 were using phonography, 29 Taylor's, 7 Gurney's (*i.e.*, Mason's), 3 Mavor's, and 2 Lewis's; while of the 80 members of the London Shorthand Writers' Association, chiefly employed in business offices, at least five-sixths were phonographers. According to a recent (1882) history of shorthand, of 291 professional stenographers in London 134 used phonography, 89 Taylor's, 35 Gurney's, 8 Lewis's, 8 Mavor's, and 17 other systems (Byrom's, Graham's, Moat's, etc.).

Pitman's phonography.

The main features of Pitman's system must now be described. The alphabet of consonant-sounds is *—p, b; t, d; ch* (as in *chip*), *j; k, g* (as in *gay*); *f, v; th* (as in *thing*), *dh* (as in *them*); *s, z; sh, zh* (as in *vision*); *m, n, ng* (as in *thing*); *l, r; w, y, h.* The sounds *p, t, ch, k* are represented respectively by the

Pitman's system.

[1] For Early English systems, see especially some careful papers by Mr. A. Paterson in *Phonetic Journal* (1886).

four straight strokes ; and the corresponding voiced sounds *b, d, j, g* by exactly the same signs respectively written heavy. *F, th* (as in *thing*), *s, sh* are indicated by respectively ; the same signs written heavy and tapering to the ends are used for *v, dh, z, zh* respectively. *M, n, l, r* are denoted by respectively. *R* is also represented by written upwards and in a more slanting direction than the sign for *ch*. The signs for *sh* and *l* may be written up or down when in combination, but standing alone *sh* is written downwards and *l* upwards. The signs for *w, y, h* are , all written upwards. *H* has also down. *Ng, mp* (or *mb*), *rch* (or *rj*), *lr*, are represented by the signs for *n, m, r, l* respectively written heavy. Signs are provided for the Scotch guttural *ch* (as in *loch*), the Welsh *ll*, and the French nasal *n*. *S* is generally written by a small circle. The long-vowel sounds are thus classified—*ā* (as in *balm*), *ē* (as in *bait*), *ee* (as in *feet*), *aw* (as in *law*), *ō* (as in *coat*), *ōō* (as in *boot*). The vowels *ā, ē, ee* are marked by a heavy dot placed respectively at the beginning, middle, and end of a consonant-sign ; *aw, ō, ōō* by a heavy dash in the same three positions, and generally struck at right angles to the direction of the consonant. The short vowels are *ă* (as in *pat*) *ĕ* (as in *pet*), *ĭ* (as in *pit*), *ŏ* (as in *pot*), *ŭ* (as in *but*), and *o͝o* (as in *put*). The signs for these are the same as for the corresponding long vowels just enumerated, except that they are written light. Signs similarly placed are provided for the diphthongs *oi* (as in *boil*), *o͝ă* or *o͝ĕ*, *o͝ĭ* (as in *Bonnerges, poet, coincide*), for the series *yā, yē, yee*, etc., and for the series *wā, wē, wee*, etc. The signs for *ei* (as in *bite*) and *ou* (as in *cow*) are , and may be placed in any position with respect to a consonant. A straight line may receive four hooks, one at each side of the beginning and end, but a curve only two, one at each end in the direction of the curve. Hooks applied to a straight line indicate the addition of, *r, l, n*, and *f* or *v* respectively, thus— *pr*, *pl*, *pf* or *pv*, and *pn* ; *kr*, *kl*, *kf*, *kn* ; *rf* or *rv*, *rn*. Hooks applied to a curve denote the addition of *r, n* respectively, thus— *fr*, *fn* ; *mr*, *mn*. Vowel-signs placed after (or, in the case of horizontal strokes, under) a consonant, having the *n* or *f, v* hook are read between the consonant and the *n* or *f* ; thus *cough*, *fun*, but *crow*, *pray*. A large hook at the commencement of a curve signifies the addition of *l*, as *fl*. The hooks combine easily with the circle *s*, thus— *sp*, *spr* (where the hook *r* is implied or included in the circle), *spl*, *pns* (the hook *n* being included), *pfs*, etc. The halving principle is one of the happiest devices in the whole history of shorthand. The halving of a light stroke —that is, writing it half length—implies the addition of *t* ; the halving of a heavy stroke that of *d*, the vowel placed after (or under) the halved stroke being read between the consonant and the added *t* or *d*, thus— *saw*, *sought*, *Dee*, *deed*, *pit*, *cat*, *fat*, *note*, etc. By this means very brief signs are provided for hosts of syllables ending in *t* and *d*, and for a number of verbal forms ending in *ed*, thus— *ended*. The halving of a heavy stroke may, if necessary, add *t*, and that of a light stroke *d*, thus— *beautified*. By combining the hook, the circle, and the halving principle, two or three together, exceedingly brief signs are obtained for a number of consonantal series consisting of the combination of a consonant with one or more of the sounds *s, r, l, n, f, t*, thus— *sp*, *spr*, *sprt*, *sprts* ; *pl*, *spl*, *splt*, *splnt*, *splnts* ; *fn*, *fns*, *fnt*, *fnts* ; *frn*, *frnd*, etc.

As a vowel-mark cannot conveniently be placed to a hook or circle, we are easily led to a way of distinguishing in outline between such words as *cough* and *coffee*, *pen* and *penny*, *race* and *racy*, etc. This distinction limits the number of possible readings of an unvocalized outline. A large hook at the end of a stroke indicates the addition of *-shon* (as in *fashion, action*, etc.). This hook easily combines with the circle *s*, as in *actions*, *positions*. The circle *s* made large indicates *ss* or *sz*, as in *pieces*, *losses*. The vowel between *s* and *s* (*z*) may be marked inside the circle, as in *exercise*, *subsistence*. The circle *s* lengthened to a loop signifies *st*, as in *step*, *post*, while a longer loop indicates *str*, as in *muster*, *minster*. The loop may be continued through the consonantal stroke and terminate in a circle to denote *sts* and *strs*, as in *boasts*, *minsters*. The loop written on the left or lower side of a straight stroke implies the *n* hook and so signifies *nst*, as in *against*, *danced*. A curve (or a straight stroke with a final hook) written double length implies the addition of *tr, dr*, or *thr*, as in *father*, *letter*, *kinder*, *fender*, *render*. This practice is quite safe in the case of curves, but a straight stroke should not be lengthened in this way when there is danger of reading it as a double letter. The lineal consonant-signs may stand alone to represent certain short and common words as in many of the old a, b, c systems, with this difference, that in the old systems each letter represents several words, but in phonography, in almost every case, only one. By writing the horizontal strokes in two positions with respect to the line (above and on) and the others in three positions (entirely above, resting on, and passing through the line) the number is nearly trebled, and very brief signs are obtained for some seventy or eighty common short words (e.g., *be, by, in, if, at, it, my, me*, etc.). A few very common monosyllables are represented by their vowel-marks, as . *the* (remnant of), *of* (remnant of), *on* (remnant of). A certain number of longer words which occur frequently are contracted, generally by omitting the latter part, sometimes a middle part of the word, as in (*ksp*) *expect*, (*djr*) *danger*, (*krk sk*) *characteristic*, (*nd f t*) *indefatigable*. The connective phrase *of the* is intimated by writing the words between which it occurs near to each other. *The* is often expressed by a short slanting stroke or tick joined to the preceding word and generally struck downwards, thus *in the*, *for the*.

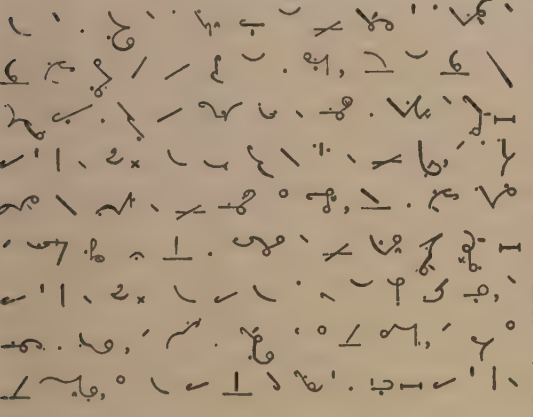
Three principles which remain to be noticed are of such importance and advantage that any one of them would go far to place phonography at the head of all other systems. These are the principles of positional writing, similar outlines, and phraseography. (1) The first slanting stroke of a word can generally be written so as either to lie entirely above the line, or rest on the line, or run through the line, thus— . In the case of words composed wholly of horizontal strokes the last two positions (on and through the line) coincide, as . These three positions are called first, second, and third respectively. The first is specially connected with first-place vowels (*ā, ă ; aw, ŏ ; ī ; oi*), the second with second-place vowels (*ē, ĕ ; ō, ŭ*), and the third with third-place vowels (*ee, ĭ ; o͞o, o͞ŏ ; ou*). In a fully vocalized style position is not employed, but in the reporting style it is of the greatest use.

Thus the outline (*tm*) written above the line () must be read either *time* or *Tom* ; when written resting on the line ( ) *tome* or *tame* ; when struck through the line () *teem, team*, or *tomb*. By this method the number of possible readings of an unvocalized outline is greatly reduced. That word in each positional group which occurs the most frequently need not be vocalized, but the others should. In the case of dissyllables it is the accented vowel which decides the position ; thus *methoúght* should be written first position (), *méthod* second position (). (2) Another way of distinguishing between words having the same consonants but different vowels is to vary the outline. The possibility of variety of outline arises from the fact that many consonant-sounds have duplicate or even triplicate signs, as we have seen. For instance, *r* has two lineal signs and a hook sign, and so each of the words *carter, curator, creature* and *creator* obtains a distinct outline. A few simple rules direct the student to a proper choice of outline, but some difference of practice obtains among phonographers in this respect. Lists of outlines for words having the same consonants are

given in the instruction books; the *Reporter's Assistant* contains the outline of every word written with not more than three strokes, and the *Phonographic Dictionary* gives the vocalized outline of every word in the language. Aided by a true phonetic representation of sounds, by occasional vocalization, variety of outline, and the context, the phonographic verbatim reporter should never misread a word.[1] (3) Lastly, phraseography. It has been found that in numberless cases two or more words may be written without lifting the pen. A judicious use of this practice promotes legibility, and the saving of time is very considerable. Words written thus should be closely connected in sense, and awkward joinings avoided. Such phrases are *I am,* *I have,* *you are,* *you may,* *it would,* *it would not,* *we are,* *we have,* *we have not,* *we have never been,* *my dear friends,* *in a very short time,* *as far as possible,* *for the most part,* and many thousands of others. For the sake of obtaining a good phraseogram for a common phrase it is often advisable to omit some part of the consonant outline. Thus the phrase *you must recollect that* may very well be written (*you must recollect that*). Lists of recommended phraseograms are given in the *Phonographic Phrase Book*, the *Legal Phrase Book*, and the *Railway Phrase Book*.

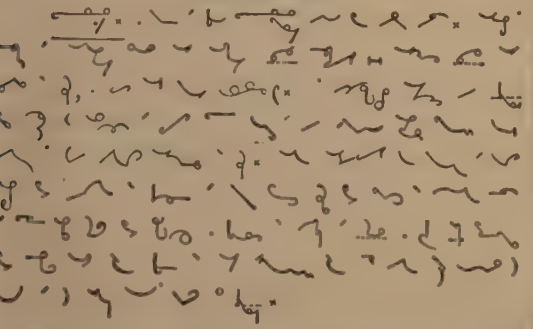
Specimens of Phonography.

Corresponding Style.



KEY.—If all the feelings of a patriot glow in our bosoms on a perusal of those eloquent speeches which are delivered in the senate, or in those public assemblies where the people are frequently convened to exercise the birthright of Britons—we owe it to shorthand. If new fervor be added to our devotion, and an additional stimulus be imparted to our exertions as Christians, by the eloquent appeals and encouraging statements made at the anniversaries of our various religious societies—we owe it to shorthand. If we have an opportunity in interesting judicial cases, of examining the evidence, and learning the proceedings with as much certainty, and nearly as much minuteness, as if we had been present on the occasion—we owe it to shorthand.

Reporting Style.



[1] Phonography is so legible that the experiment of handing the shorthand notes to phonographic compositors has often been tried with complete success. A speech of Richard Cobden, on the Corn Laws, delivered at Bath on 17th September, 1845, and occupying an hour and a quarter, was reported almost verbatim, and the notes, with a few vowels filled in, handed to the compositors of the *Bath Journal*, who set them up with the usual accuracy. A notice of the occurrence appeared the next day in the *Bath Journal*, and was immediately transferred to the columns of the *Times* and other newspapers. Mr. Reed has tried the same experiment with equal success, the notes being handed to the compositors in their original state (*Phonetic Journal*, 1884, p. 337). In Mr. Pitman's printing-office at Bath more type-setting is done from shorthand copy than from longhand. Of course it is generally unadvisable to print a speech verbatim, but much time would be saved if the reporter could write his copy in the "corresponding" or less brief and more vocalized style of phonography. Compositors could acquire the faculty of reading phonography in a very short time.

KEY (the phraseograms being indicated by hyphens).—CHARACTERISTICS OF THE AGE.—The peculiar and distinguishing characteristics of the present-age are-in every respect remarkable. Unquestionably an extraordinary and universal-change has commenced in-the internal as-well-as-the external-world—in-the-mind-of-man as-well-as in-the habits of society, the one indeed being-the necessary-consequence of the other. A rational consideration of the circumstances in-which-mankind are at-present placed must-show-us that influences of the most-important and wonderful character have-been and are operating in-such-a-manner-as-to bring-about if not-a reformation, a thorough revolution in-the-organization of society. Never in-the-history-of-the-world have benevolent and philanthropic institutions for-the relief of domestic and public affliction; societies for-the promotion of manufacturing, commercial, and agricultural interests; associations for-the instruction of the masses, the advancement of literature and science, the development of-true political-principles, for-the extension in-short of-every description of knowledge and-the-bringing-about of-every kind-of reform,—been-so numerous, so efficient, and so indefatigable in-their operation as at-the-present-day.

Of the numerous systems published since the invention of phonography the principal are A. M. Bell's *Stenophonography* (Edinburgh, 1852), Professor J. D. Everett's (London, 1877), Pocknell's *Legible Shorthand* (London, 1881), and J. M. Sloan's adaptation of the French system of Duployé (1882). Of these Professor Everett's must be pronounced much the best. The author claims to have adhered to the phonetic principle more strictly than Mr. Pitman. Thus he distinguishes the *o* in *home*, *comb*, from that in *so*, and treats *ur*, *er* as a diphthong. The alphabet is very like Mr. Pitman's in construction, light and heavy sounds being represented by light and heavy strokes. The chief feature of the system is that all vowels are marked in. This is done by joined signs, by lengthening the preceding consonant, by separating the preceding from the following consonant, by lifting the pen and writing the one consonant attached to the other, and by intersection. Mr. Pocknell, in his somewhat bewildering system, seeks (like Mr. Melville Bell) to provide a method of indicating whether a consonant is preceded or followed by a vowel or vowels. To this end he gives to each consonant three linear signs (two curves and a straight line), the requisite number of signs being made up by using three lengths of stroke. The selection of the right sign is determined by the *length* and *class* of the words represented. Much energy is devoted to indicate where a vowel stands, but not to what it is. The vowels, when expressed, are disjoined, as in phonography and most systems. Though Mr. Bell's too elaborate classification of vowels is adopted, the phonetic method of representing consonants is frequently discarded in favor of the alphabetic. Thus, no sign is provided for *zh* (as in *vision*), and the barbarous *gh* (as in *bright*) is often retained "for the sake of legibility." Mr. Pocknell goes back to the antiquated device of pictorial and arbitrary signs. The Sloan-Duployan system has been vigorously propagated; but it does not provide alphabetic characters for all the vowels and consonants in the language, contents itself with representing not actual but "approximate" sounds, does not always indicate the order in which the characters should be read, recommends the frequent omission of consonants and syllables at the "discretion" of the student, avoids angles, and introduces three slopes, instead of one, between the perpendicular and the horizontal, and therefore is not likely to meet with general acceptance.

* Systems subsequent to Pitman's.

American systems.

A considerable number of American systems, as well as systems based on Taylor's and Gurney's, were issued during the early days of the republic. Since the introduction of phonography into the States in 1845, the dissemination of the art has gone steadily forward, and its use since 1880 has been greatly on the increase, shorthand being now taught in a large number of schools. From elaborate statistics given in Mr. Rockwell's *Circular of Information* it appears that during 1882 10,197 persons received instruction in schools and classes and 2273 by correspondence. But these figures probably bear no proportion to the number of persons studying without a teacher. In almost every case phonography, or a modification of it, was selected for instruction. American shorthand societies are very numerous, most of them having been formed since 1880. Two are devoted to the Stolzean system. Of the fourteen shorthand magazines which Mr. Rockwell enumerates eleven are phonographic.

In nine cases out of ten phonography will be found admirably adapted to the purposes of verbatim reporting. But to be legible it must be written with care. This necessity arises from its brevity and its use of light and heavy, halved and double-length strokes. Hence a clumsy scribe may find a longer system, such as Gurney's, answer his purpose better. A theoretical knowledge of most systems may be gained in a few hours. Pitman's method is not so easily acquired, but an intelligent person can master its details in a few weeks. Shorthand writing is, however, mainly a matter of practice. Few can make any considerable use of it with less than six months' assiduous practice. The average rate of public speaking is very slightly over 120 words a minute. Some speakers average 150. The slowest utterance is now and then exchanged for a rapid flow of words, and 180 or 200 words a minute is no uncommon speed in certain styles of speech such as the conversational,—a speed which many persons would never acquire.[1] Most persons of average intelligence may by perseverance write with certainty at 150 words a minute. The best method of practice in the early period is to write at dictation from a book; in public speaking the frequent pauses help the writer to regain lost time. The student should write on ruled paper, which checks the tendency to a large sprawling hand when following a rapid speaker. Taylor's, Gurney's, and Lewis's systems can be written without lines, but Pitman's only at a disadvantage. Ink is preferable to pencil.

Parliamentary reporting.

Shorthand was first employed officially in the service of Parliament in 1802, when a resolution was passed that "the evidence given before all committees inquiring into the election of members should or might be reported by a person well skilled in the art of writing shorthand," and shortly afterwards W. B. Gurney was appointed shorthand-writer in this capacity to both Houses of Parliament. In 1813 a further resolution was passed by both Houses that the official writer "should attend by himself or sufficient deputy when called upon to take minutes of evidence at the bar of this House or in committees of the same." The lucrative office of shorthand-writer to both Houses of Parliament is still held by the Gurney family. Of course most of the work is done by deputy. Some of the most efficient members of Messrs. Gurney's staff are phonographers; others use Taylor's system. The amount of evidence given in the course of a tolerably long day's sitting may amount to 400 or 500 folios (72 words make a folio), which would occupy from 12 to 15 columns of the *Times* in small type. The whole must often be transcribed and delivered to the printers in the course of the night, and copies, damp from the press, are in the hands of the members and "parties" at the beginning of the sitting on the following day. Since parliament abolished election-committees and committed to judges the duty of inquiring into petitions against the return of a member, an official shorthand-writer has to be in attendance upon the judge appointed to hear any particular case. He has often a small staff of assistants. Messrs. Gurney or their representatives are also required to attend the sittings of the House of Lords as a court of appeal to take the judgments of the law lords. Finally, Government shorthand-writers are often employed in taking notes of important state-trials and inquiries conducted by the various departments of Government, as well as of the proceedings of Royal Commissions, whenever the evidence of witnesses is taken.[2] The transcription of the notes may be accomplished in several ways, as by dictating from different parts of the notes to several longhand-writers simultaneously.[3] Not all the newspaper parliamentary reporters can take a perfect note, and cases occur in which the reporter enters the gallery without being able to write shorthand at all.

Foreign Shorthand Systems.

Foreign systems.

German.—C. A. Ramsay's *Tacheographia* (Frankfort, 1679, and several times afterwards until 1743) was an adaptation of T. Shelton's English system. Mosengeil (1797) first practically introduced shorthand writing into Germany in an adaptation of the Taylor-Bertin method. Reischl's (1808) is a modification of Mosengeil's. On Horstig's (1797) are based those of an anonymous writer (Nuremberg, 1798), Heim (1820), Thon (1825), an anonymous author (Tübingen, 1830), Nowack (1830), Ineichen (1831), an anonymous author (Munich, 1831), and Binder (1855). Mosengeil published a second system (1819) in which Horstig's alphabet is used. On the Mosengeil-Horstig system are based Berthold's (1819) and Stärk's (1822). On Danzer's (1800), a close imitation of Taylor's, is based that of Ellison v. Nidlef (1820). Other systems are those of Leichtlen (1819); J. Brede (1827); Nowack (1834), a system in which the ellipse is employed as well as the circle; Billharz (1838); Cämmerer (1848), a modification of Selwyn's phonography (1847); Schmitt (1850); Fischbäck (1857), a reproduction of Taylor's; and that of an anonymous author (1872), based on Horstig, Mosengeil, and Heim. Nowack, in his later method of 1834, makes a new departure in avoiding right or obtuse angles, and in endeavoring to approximate to ordinary writing. This system Gabelsberger considered to be the best which had appeared down to that date. F. X. Gabelsberger's *Anleitung zur deutschen Redezeichenkunst* (Munich, 1834) is the most important of the German systems. The author, an official attached to the Bavarian ministry, commenced his system for private purposes, but was induced to perfect it on account of the summoning of a parliament for Bavaria in 1819. Submitted to public examination in 1829, it was pronounced satisfactory, the report stating that pupils taught on this system executed their trial specimens with the required speed, and read what they had written, and even what others had written, with ease and certainty. The method is based on modifications of geometrical forms, designed to suit the position of the hand in ordinary writing. The author considered that a system composed of simple geometrical strokes forming determinate angles with each other was unadapted to rapid

[1] Phenomenal rates of speed are recorded in the *Phonetic Journal* for 1885, p. 338. Mr. T. A. Reed, the veteran phonographer, had been engaged to report a well-known American divine preaching at Westminster Abbey. The sermon was carefully timed and the words in the printed report counted. The average came out at 213 words a minute. A photographed specimen page of Mr. Reed's notes on this occasion is given in the *Reporter's Magazine*, September, 1885.

[2] There is no full official report of the debates in the British Parliament (as in most other countries), and technically no person has a right to report them. The House may be cleared at any moment of all strangers, including representatives of the press, by an order of the House as a whole. On seven occasions of note resolutions have been passed prohibiting the reporting of the proceedings of the House of Commons, the last on 25th March, 1771. But times have changed, and members now frequently complain that their speeches are not reported. To supply the deficiencies of the newspapers arrangements have been made by the House with Mr. Hansard for the special reporting of debates in committee and those occurring at an early hour in the morning, which are given only in the most summary form in the daily papers. Formerly all Hansard's reports were collected from those appearing in the newspapers. See further Mr. S. Whitaker's *Parliamentary Reporting in England, Foreign Countries, and the Colonies, with notes on Parliamentary Privilege* (Manchester, 1878).

[3] On the best methods of transcribing and dictating, see Mr. T. A. Reed's papers in the *Phonetic Journal*, 1886, pp. 10, 33, 45.

writing. He does not recognize all the varieties of sound, and makes some distinctions which are merely orthographical. Soft sounds have small, light, and round signs, while the hard sounds have large, heavy, and straight signs. The signs too are derived from the current alphabet, so that one can find the former contained in the latter. Vowels standing between consonants are not literally inserted, but symbolically indicated by either position or shape of the surrounding consonants, without however leaving the straight writing line. The proceedings of the chambers in Austria, Bavaria, Baden, Würtemberg, Saxony, Saxe-Weimar, Coburg-Gotha, Silesia, and the Rhine provinces are reported solely by writers of this method, and half the stenographers in the German reichstag use it. There are in Germany and Austria more than 540 societies containing over 20,000 members devoted to it. It is officially taught in all the middle class schools in Bavaria, Saxony, and Austria. It has been adapted to foreign languages to such an extent that legislative proceedings are reported by it in Prague, Agram, Pesth, Sophia, Athens, Copenhagen, Christiania, Stockholm, and Helsingfors. On Gabelsberger's system is based that of W. Stolze (1840). There are nearly 400 Stolzean associations with over 8000 members. The system is officially used in the Prussian, German, and Hungarian parliaments, in the last two along with Gabelsberger's. Faulmann (Vienna, 1875) attempted in his *Phonographie* to combine the two methods. While Gabelsberger's system has remained unchanged in principle, Stolze's has split into two divisions, the old and the new. These contain many smaller factions, *e.g.*, Velten's (1876) and Adler's (1877). Arends's (1860) is copied from the French system of Fayet. Roller's (1874) and Lehmann's (1875) are offshoots of Arends's. Many other methods have appeared and as rapidly been forgotten. The schools of Gabelsberger and Stolze can boast of a very extensive shorthand literature. Gabelsberger's system has been adapted to English by A. Geiger (Dresden, 1860 and 1873), who adhered too closely to the German original, and more successfully by H. Richter (London, 1886), and Stolze's by G. Michaelis (Berlin, 1863).

French.—The earliest French system worthy of notice is that of Coulon de Thévenot (1777), in which the vowels are disjoined from the consonants. The methods practiced at the present day may be divided into two classes, those derived from Taylor's English system, translated in 1791 by T. P. Bertin, and those invented in France. The latter are (*a*) Coulon de Thévenot's; (*b*) systems founded on the principle of the inclination of the usual writing.—the best known being those of Fayet (1832) and Sénocq (1842); and (*c*) systems derived from the method of Conen de Prépéan (5 editions from 1813 to 1833). Prévost, who till 1870 directed the stenographic service of the senate, produced the best modification of Taylor. Many authors have copied and spoiled this system of Prévost. The best known are Plantier (1844) and Tondeur (1849). Zeibig thinks well of A. Delaunay's improvements on Prévost's system. On Conen's are based those of Aimé-Paris (1822), Cadrès-Marmet (1828), Potel (1842), the Duployé brothers (1868), Guénin, etc. Among amateur writers the Duployan method is best known, owing largely to vigorous pushing, but the profession class it among the least efficient of all. Of the forty writers in the official service of parliament twenty-two use Prévost's and those founded on it (all based ultimately on Taylor's), while ten employ methods based on Conen's.

Spanish.—The father of Spanish stenography was Don Francisco de Paula Marti, whose system, first published in 1803, still holds its ground against all rivals. The alphabet is a combination of Taylor's and Coulon's. By decree of 21st November, 1802, a public professorship of shorthand was founded in Madrid, Marti being the first professor. Founded on Marti's system are those of Serra y Ginesta (1816) and Xamarillo (1811). Of the thirty-two Spanish systems enumerated by Zeibig many are merely imitations or reproductions of Marti's, and adaptations of Gabelsberger's, Stolze's, and Pitman's systems. That of Garriga y Maril (1863) has attained some popularity in Spain.

Portuguese.—Marti's son carried his father's system to Portugal, where shorthand is still entirely unknown except in the parliament and the courts. Of the twenty reporters in the senate and chamber at Buenos Ayres ten use Pitman's phonography, six Marti's, and the rest Garriga's. A shorthand society was organized in Buenos Ayres in 1880. The systems used in the Brazilian chambers are those of Silva Velho (1852) and Garriga. The reporters in the assembly of Venezuela use Marti's method.

Italian.—Italian translations and adaptations of Taylor's system succeeded one another in considerable numbers from Amanti (1809) to Bianchini (1871). Delpino's (1819) is the best. The Gabelsberger-Noe system (1863) is the only other which has gained many followers. Since 1885 the debates of the senate have been partly reported by the Michela stenographic machine with fair results.

Dutch.—J. Reijner's Dutch method (1673) was an adaptation of Shelton's and Bussuijt's (1814) of Conen's system. Sommerhausen and Bossaert (1829) received prizes from the Government for their productions. The twelve stenographers employed in the parliament use the system of Cornelis Steger (1867), president of the bureau, who translated Taylor's work and has written a history of shorthand. Gabelsberger's system was transferred to Dutch by Rietstap (1869) and Stolze's by Reinbold (1881).

Adaptations of Gabelsberger's method have come into use in the remaining countries of Europe, superseding all others.

Numerous mechanical reporting machines have been invented. The best is by Michela mentioned above. For a description of such machines see *Phonetic Journal* for 1881, p. 274; 1884, pp. 12, 34, 35; 1885, pp. 52, 268, 278, 291, 447; 1886, p. 22. They take as long to learn as a shorthand system, cannot easily be carried about, are liable to get out of order, and make a noise.

Sources of Information.—J. W. Zeibig's *Geschichte u. Literatur der Geschwindschreibkunst* (Dresden, 1878) contains an historical sketch of the use of shorthand in ancient and modern times (especially in Germany), a full bibliography of shorthand literature in all languages, a number of lithographed specimens, and a useful index. *Circulars of Information of the Bureau of Education*, No. 2, 1884 (Washington, 1884), by J. E. Rockwell, contains a very complete and accurate bibliography of English and American shorthand publications, a chronological list of 483 English and American shorthand authors, notices on shorthand in the United States, on the employment of stenographers in the American courts, on American shorthand societies and magazines, and a beautifully engraved sheet of 112 shorthand alphabets. The *Phonetic Journal*, especially the recent volumes, contains a mass of information on shorthand subjects. Isaac Pitman's *History of Shorthand* (reprinted in the *Phonetic Journal* of 1884) reviews the principal English systems previous to phonography, and a few foreign ones. The author draws largely on J. H. Lewis's *Historical Account of the Rise and Progress of Stenography* (London, 1816). Other histories of shorthand are by F. X. Gabelsberger (prefixed to his *Anleitung zur deutschen Redezeichenkunst*, Munich, 1834) A. Fossé (prefixed to his *Cours théorique et pratique de Sténographie*, Paris, 1849), Scott de Martinville (Paris, 1849), M. Levy (London, 1862), and T. Anderson (London, 1882). Here too should be mentioned J. Heger's *Bemerkenswerthes über die Stenographie* (Vienna, 1841), mainly historical; J. Anders's *Entwurf einer allgemeinen Gesch. u. Lit. d. Stenographie* (Coeslin, 1855); R. Fischer's *Die Stenographie nach Geschichte, Wesen, u. Bedeutung* (Leipsic, 1860); Krieg's *Katechismus der Stenographie* (Leipsic, 1876); Dr. Westby-Gibson's *Early Shorthand Systems* (London, 1882); T. Anderson's *Shorthand Systems*, with a number of specimens (London, 1884); T. A. Reed's *Reporter's Guide* (London, 1885) and *Leaves from the Notebook of T. A. Reed* (London, 1885). Mr. C. Walford's *Statistical Review of the Literature of Shorthand* (London, 1885) contains valuable information on the circulation of shorthand books and on shorthand libraries. The largest stenographic library in the world is that of the Royal Stenographic Institute at Dresden. (I. G N. K.-F.)

SHORTSIGHT. See OPHTHALMOLOGY.

SHOSHONG, a town in the British protectorate of Bechuanaland, the chief settlement of the Eastern Bamangwatos, is situated in a glen at the foot of a range of Primary rocks on the Shoshou, a periodically flowing brook which flows eastwards into the Limpopo or Uri river. It lies about 400 miles north of Kimberley, with which it was connected by road and telegraph under Sir Charles Warren's administration. For white men—traders, hunters, and explorers—it is and must always be a place of primary importance, as three great routes, from Griqualand West, the Orange Free State, and the Transvaal, meet at this point and again branch off north to the Zambesi, northeast to the Matabele and Mashona countries, and northwest to the Western Bamangwato and Damaraland. Shoshong is thus a main gateway between Southern and Central Africa. The site was originally chosen as easily defensible against the Matabele. Water is scarce, and the present king, Khama, has taken over a well dug by one of the traders, the use of which he permits on the payment of a water-rate of £1 per month per family. Altogether there are 7000 to 8000 native huts in Shoshong, and the population is estimated at from 15,000 to 30,000. The white inhabitants—mostly English traders—number about 20. A flourishing mission station of the London Missionary Society, preceded for many years by a station of Hermannsburg Lutheran Missionary Society was founded in 1862, and has exercised a great influence on the history of the town and tribe. There is a brick-built church, erected in 1867.

See Mackenzie, *Ten Years North of the Orange River*, 1871; Holub, *Seven Years in South Africa*, 1881; *Further Government Correspondence respecting the affairs of the Transvaal*, 1886.

SHOVEL, Sir Cloudesley (*c.* 1650–1707), English admiral, was according to some accounts a native of Yorkshire, but the most commonly accepted statement is that he was born of poor parents about 1650 in Clay, a fishing-village of Norfolk, where he was apprenticed to a shoemaker. Having run away to sea, he became cabin-boy on board a ship commanded by Sir Christopher Mynns. He set himself to study navigation, and, owing to his able seamanship and brave and open-hearted disposition, became a general favorite and obtained quick promotion. In 1674 he served as lieutenant under Sir John Narborough in the Mediterranean, where he burned four men-of-war under the castles and walls of Tripoli, belonging to the pirates of that place. He was present as captain of the "Edgar" at the first fight at Bantry Bay, and shortly afterwards was knighted. In 1690 he convoyed William III. across St. George's Channel to Ireland; the same year he was made rear-admiral of the blue, and was present at the battle of Beachy Head on 10th July. In 1692 he was appointed rear-admiral of the red, and joined Admiral Russell, under whom he greatly distinguished himself at La Hogue, having a principal share in burning twenty of the enemy's men-of-war. Not long after, when Admiral Russell was dismissed from the service, Shovel was put in joint command of the fleet with Admiral Killigrew and Sir Ralph Delaval. In 1702 he was sent to bring home the spoils of the French and Spanish fleets from Vigo, after their capture by Sir George Rooke, and in 1704 he served under Sir George Rooke in the Mediterranean. In January, 1705, he was named rear-admiral of England, and shortly afterwards commander-in-chief of the British fleets. He coöperated in the capture of Barcelona along with the earl of Peterborough in 1705, and made an unsuccessful attempt on Toulon in October, 1707. When returning with the fleet to England his ship, the "Association," at eight o'clock at night on the 22d October, struck on the rocks near Scilly, and was seen by those on board the "St. George" to go down in three or four minutes' time, not a soul being saved of 800 men that were on board. The body of Sir Cloudesley Shovel was cast ashore next day, and was buried in Westminster Abbey.

See *Life and Glorious Actions of Sir Cloudesley Shovel*, 1707; Burnet's *Own Times;* and various discussions in *Notes and Queries*, 5th series, vols. x. and xi.

SHOVELER, formerly spelt Shovelar, and more anciently Shovelard, a word by which used to be meant the bird now almost invariably called Spoonbill (*q.v.*), but in the latter half of the 16th century transferred to one hitherto generally, and in these days locally, known as the Spoon-billed Duck—the *Anas clypeata* of Linnæus and *Spatula* or *Rhynchaspis clypeata* of modern writers. All these names refer to the shape of the bird's bill, which combined with the remarkably long *lamellæ* (not wholly incomparable with the "whalebone" of the toothless Cetaceans) that beset both maxilla and mandible, has been thought sufficient to remove the species from the Linnæan genus *Anas*. Except for the extraordinary formation of this feature, which carries with it a clumsy look, the male Shoveler would pass for one of the most beautiful of this generally beautiful group of birds. As it is, for bright and variegated coloring, there are few of his kindred to whom he is inferior. His golden eye, his dark green head, surmounting a throat of pure white and succeeded by a breast and flanks of rich bay, are conspicuous; while his deep brown back, white scapulars, lesser wing-coverts (often miscalled shoulders) of a glaucous blue, and glossy green speculum bordered with white present a wonderful contrast of the richest tints, heightened again by his bright orange feet. On the other hand, the female, excepting the blue wing-coverts she has in common with her mate, is habited very like the ordinary Wild-Duck, *A. boscas* (see vol. vii. p. 437). The Shoveler is not an abundant species, and in Great Britain its distribution is local; but its numbers have remarkably increased since the passing of the Wild-Fowl Protection Act in 1876,[1] so that in certain districts it has regained its old position as an indigenous member of the Fauna. It has not ordinarily a very high northern range, but inhabits the greater part of Europe, Asia, and America, passing southwards, like most of the *Anatidæ* towards winter, constantly reaching India, Ceylon, Abyssinia, the Antilles, and Central America, while it is known to have occurred at that season in New Granada, and, according to Gould, in Australia. Generally resembling in its habits the other freshwater Ducks, the Shoveler has one peculiarity that has been rarely, if ever, mentioned, and one that is perhaps correlated with the structure of its bill. It seems to be especially given to feeding on the surface of the water immediately above the spot where Diving Ducks (*Fuliguliæ*) are employing themselves beneath. On such occasions a pair of Shovelers may be watched, almost for the hour together, swimming in a circle, about a yard in diameter, their heads turned inwards towards its centre, their bills immersed vertically in the water, and engaged in sifting, by means of the long *lamellæ* before mentioned, the floating matters that are disturbed by their submerged allies and rise to the top. These gyrations are executed with the greatest ease, each Shoveler of the pair merely using the outer leg to impel it on its circular course, and to the observer the prettiest part of the performance is the precision with which each preserves its relative distance from its comrade.

Four other species of the genus *Spatula*, all possessing the characteristic light blue "shoulders," have been described: one, *S. platalea*, from the southern parts of South America, having the head, neck, and upper back of a pale reddish brown, freckled or closely spotted with dark brown, and a dull bay breast with interrupted bars; a second, *S. capensis*, from South Africa, much lighter in color than the female of *S. clypeata;* a third and a fourth, *S. rhynchotis* and *S. variegata*, from Australia and New Zealand respectively,—these last much darker in general coloration, and the males possessing a white crescentic mark between the bill and the eye, very like that which is found in the South-American Blue-winged Teal (*Querquedula cyanoptera*), but so much resembling each other that their specific distinctness has been disputed by good authority. In these last two the sexual difference is well marked by the plumage; but in the South-American and South-African species it would seem that both male and female have much the same appearance, as is the case with so many species of the restricted genus *Anas*, though this cannot yet be asserted with certainty.

(A. N.)

SHREVEPORT, a city of the United States, capital of Caddo parish, Louisiana, on the west bank of Red River and near to Sodo Lake, is the eastern terminus of the Texas Pacific Railroad, 327 miles by rail northwest of New Orleans, with which it has regular steamboat communication. Situated in the heart of a very fruitful cotton-growing region, it is one of the principal cotton-markets in the southwest of the United States, and is the second commercial city in the State. It exports annually about 125,000 bales of cotton, and carries on a trade likewise in hides, wool, and tallow. It has factories for carriages, cotton gins, cotton-seed oil, soap, ice, sashes, and blinds, and spokes and hubs, also foundries, machine-shops, a planing-mill, sawmills, and breweries. The town possesses among public buildings a handsome court-house and a cotton exchange. Red River is spanned by an iron bridge 20 feet wide and 1200 long. Shreveport, which was incorporated in 1839, had a population of 4607 in 1870

[1] Prior to that year there was perhaps only one district in England wherein the Shoveler could be said to breed regularly, and thereto only a few pairs resorted. In 1885 there must have been a dozen counties in which it nested, and in some of them the pairs breeding might be reckoned by the score.

and of 8009 in 1880; in 1886 the population was estimated at 15,000.

SHREW, a general term applied to the species of the family *Soricidæ*, order *Insectivora* (see vol. xv. p. 407), but in the British Isles more particularly to the common and to the lesser shrew (*Sorex vulgaris*, L., and *S. pygmæus*, Pall.).

The common shrew is, in England at least, by far the commoner of the two. It is a small animal about the size of the common mouse, which it somewhat resembles in the shape of its body, tail, and feet. But here the resemblance ends, for, unlike the mouse, it possesses a remarkably long and slender muzzle, with prominent nostrils, which project far beyond the lower lip; the eyes are very small and almost concealed by the fur; the ears are wide and short, scarcely rising above the long hairs surrounding them, and are provided internally with a pair of deep folds, capable, when laid forward, of closing the entrance; the tail, which is slightly shorter than the body (without the head), is quadrangular in shape and clothed more or less densely with moderately long hairs, terminating in a short pencil (in old individuals these hairs become worn away, so that in some specimens the tail is almost quite naked); the feet are five-toed, the toes terminating in slender, acutely pointed, non-retractile claws. The dentition is very peculiar and characteristic: there are

Common Shrew (*Sorex vulgaris*, L.).

in all thirty-two teeth, tipped with deep crimson; of these twelve only (the number is characteristic, with one exception only, of the family) belong to the lower jaw; of the remaining twenty ten occupy each side of the upper jaw, and of these the first three, as they are implanted in the premaxillary bone, are termed incisors. The first incisor is a large tooth with a long anterior canine-like cusp and a small posterior one; then follow two small unicuspidate teeth; these are succeeded by three similar progressively smaller teeth, whereof the first has been called a canine and the other two premolars; the next tooth, also a premolar, is a large multicuspidate tooth; and this is followed by three molars, of which the third is small with a triangular crown. In the lower jaw we find on each side anteriorly three teeth corresponding to the seven anterior teeth above, of which the first is almost horizontal in direction, its upper surface being marked by three notches, which receive the points of the three upper front teeth with which they come in contact when the jaws are closed; then follow two small teeth and three molars. The body is clothed with closely set uniformly long fur, very soft and dense, varying in color from light reddish to dark brown above, rarely speckled over or spotted or even banded with white. The under surface of both the body and the tail is grayish; the basal four-fifths of all the hairs above and beneath are dark bluish gray; the hairs of the tail are less densely set and coarser. On each side of the body, at a point about one-third of the distance between the elbow and the knee, may be found, especially in the rutting season, a cutaneous gland covered by two rows of coarse inbent hairs. This gland secretes a peculiar fluid, on which the unpleasant cheesy odor of the animal depends, and which is evidently also protective, rendering it secure against the attacks of many predaceous animals.

The lesser shrew (*S. pygmæus*) is much less abundant in England and Scotland, but comparatively common in Ireland, where the common shrew has not yet been found. It appears at first sight to be a diminutive variant of that species which it closely resembles in external form. It was said to differ in having the tail longer than the body (without the head), whereas in the common shrew the body (without the head) is longer than the tail, and in the last unicuspidate upper molar tooth being comparatively larger and more external than in the other species. But the present writer has found these characters so exceedingly liable to variation as to be almost worthless; he has therefore discovered reliable points of distinction as follows: in *S. pygmæus* the third upper incisor (when the teeth are unworn) is shorter, or at least not longer, than the next following tooth, whereas in *S. vulgaris* it is always longer, and the length of the forearm and hand combined is very constantly 13 m.m. [.51 in.] in the former species, while in the latter it is 17 m.m. [.66 in.].

The habits of both the common and the lesser shrew correspond. They live generally in the neighborhood of woods, making their nests under the roots of trees or in any slight depression, occasionally even in the midst of open fields, inhabiting the disused burrows of field-mice. Owing to their very small size, dark color, rapid movements, and chiefly nocturnal habits, they easily escape observation. They seek their food, which consists of insects, insect larvæ, small worms, and slugs, under dead leaves, fallen trees, and in grassy places. Like the mole, they are very pugnacious, and if two or more are confined together in a limited space they invariably fight fiercely, the fallen becoming the food of the victorious. They also, like the mole, are exceedingly voracious, and soon die if deprived of food; and it is probably to insufficiency of food in the early dry autumnal season that the well-known immense mortality amongst these animals at that time of the year is due. The breeding season extends from the end of April to the beginning of August, and five to seven, more rarely ten, young may be found in their nests; they are naked, blind, and toothless at birth, but soon run about snapping at everything within reach, the anterior pair of incisors in both jaws quickly piercing the gum, followed by the last pair of upper premolars, which at birth form prominent elevations in the gum.

The alpine shrew (*S. alpinus*, Schinz), restricted to the Alpine region of Central Europe, is slightly longer than the common shrew and differs from it conspicuously in its much longer tail, which exceeds the length of the head and body, in the color of the fur, which is dark on both surfaces, and in the large size of the upper antepenultimate premolar.

The water-shrew (*Crossopus fodiens*, Pall.), the third and last species inhabiting England, differs from the common shrew in being considerably larger with a shorter and much broader muzzle, comparatively smaller eyes, and larger feet adapted for swimming,—the sides of the feet and toes being provided with comb-like fringes of stiff hairs. The tail is longer than the body (without the head) and possesses a well-developed swimming fringe of moderately long regularly ranged hairs, which extend along the middle of its flat under surface from the end of its basal third to its extremity. The fur of the body is long and very dense, varying much in color in different individuals, and this has given rise to descriptions of many nominal species; the prevailing shades are dark, almost black, brown above, beneath more or less bright ashy tinged with yellowish; occasionally, sometimes in the same brood, we find some individuals with the under surface more or less dark colored. In the number as well as in the shape of the teeth the water-shrew differs from the common shrew: there is a premolar less on each side above; the bases of the teeth are much more

prolonged posteriorly; and their cusps are much less stained brown, so that in old individuals with worn teeth they often appear altogether white. This species resembles the otter in its aquatic habits, swimming and diving with great agility. It frequents rivers and lakes, making its burrows in the overhanging banks, from which, when disturbed, it escapes into the water. Its food consists of the different species of water insects and their larvæ, small crustaceans, and probably the fry of small fishes. It is generally distributed throughout England, is less common in Scotland, but as yet it has not been recorded in Ireland.

The geographical range of the common shrew is exceedingly wide, extending eastward through Europe and Asia (north of the Himalayas) to North America. The lesser shrew extends concomitantly through Europe and Asia to Saghalin Island; and specimens of the water-shrew have been brought from different parts of Europe, and from Asia as far east as the Altai range. In Siberia the common shrew is abundant in the snow-clad wastes about the Olenek river within the arctic circle. Indeed the hardiness of this little animal, as well as of other species of red-toothed shrews is very remarkable. In Dr. C. H. Merriam's *Mammals of the Adirondack Region* we find the following note on the habits of the common North American species (*Blarina brevicauda*) of an allied genus: "The rigors of our northern winters seem to have no effect in diminishing its activity, for it scampers about on the snow during the severest weather, and I have known it to be out when the thermometer indicated a temperature of —20° Fahr. It makes long journeys over the snow, burrowing down whenever it comes to an elevation that denotes the presence of a log or stump, and I am inclined to believe that at this season it must feed largely upon the chrysalides and larvæ of insects that are always to be found in such places." Other species of red-toothed shrews are restricted chiefly to North America, where they are found in much greater variety than in the Old World, though *Crossopus* is not represented. Its place is taken by two species of the genus *Sorex* (*S. palustris*, Richardson, east of the Rocky Mountains, and *S. hydrodromus*, Dobson, from Unalaska Island), provided, like the water-shrew, with pedal swimming fringes, but with the unfringed tail and dentition of the common shrew,—the first named being about as large as the water shrew, while the Unalaska species scarcely exceeds the size of the lesser shrew. Of the American forms *S. bendiri*, Merriam, is by far the largest known species of the genus. In it, as in many others inhabiting North America, the canine shows a tendency to diminish in size, which is more pronounced in *S. richardsonii*, Bachm., and in *S. vagrans*, Cooper; in *S. hoyi*, Baird, it is rudimentary, and in *S. crawfordi*, Baird, altogether absent. The diminutive *S. personatus*, Geoff., widely distributed throughout temperate North America, resembles *S. pygmæus*, in its small size. Other red-toothed shrews belonging to the allied genus *Blarina*, distinguished from *Sorex* by their dentition and by the remarkable shortness of the tail, are very common and characteristic of the North American continent. All the red-toothed shrews (except the aquatic forms) closely resemble one another in habits and Dr. Merriam has made the highly interesting discovery that the common short-tailed North American shrew supplements its insectivorous fare by feeding on beech-nuts, which will account for the generally very worn state of the teeth in this species. In destroying great numbers of slugs, insects, and insect larvæ they greatly aid the farmer in the preservation of his crops and merit protection. Although their penetrating odor renders them in a great measure safe from the attacks of rapacious mammals, they are destroyed in large numbers by nocturnal birds of prey. (G. E. D.)

SHREWSBURY, an old market-town, a municipal and parliamentary borough, and the county and assize town of Shropshire, England, is situated on a slightly elevated peninsula formed by a bend of the Severn, and on various railway lines, 30 miles south of Chester, and 163 northwest of London by the London and Northwestern Railway, the distance by the Great Western being 171 miles. The Severn is crossed by three stone bridges,—the English bridge (re-erected 1774), on the east, consisting of seven semicircular arches; the Welsh bridge (re-erected 1795); of five arches, on the west; and the Kingsland bridge (opened in 1882), of iron on the bow and girder principle. The streets are hilly and irregular, but strikingly picturesque from their number of antique timber houses, among which may be mentioned that in Butcher Row formerly the town residence of the abbot of Lilleshall, and the old council-house overlooking the Severn, erected in 1502 for the presidents of the council of the Welsh marches. Of the town ramparts built in the reign of Henry III. the principal remains are a small portion on the north side called the Roushill walls, and another portion on the southwest, used as a public walk, on which stands a square embattled tower. The castle built by Roger de Montgomery was dismantled in the reign of James II. but there still remain the archway of the interior gateway, the walls of the inner court, and two large round towers of the time of Edward I. Roger de Montgomery also founded in 1083 the abbey of St. Peter and St. Paul, which was of great extent and very richly endowed. At the dissolution it was destroyed except part of the nave and the western tower of the church, which have been converted into a parish church, under the name of the church of the Holy Cross. The other churches of special interest are St. Mary's, founded in the 10th century, a fine cruciform structure with a tower and spire 222 feet in height, displaying examples of various styles of architecture from Early Norman to Perpendicular,—the base of the tower, the nave, and the doorways being Norman, the transept Early English, and the aisles 15th century, while the interior is specially worthy of notice for its elaborate details, its stained glass, and its ancient monuments; St. Julian's, originally built before the Conquest, but rebuilt, in 1748, except the tower, the older portion of which is Norman and the upper part 15th century; St. Alkmonds, also dating from the 10th century, but rebuilt towards the close of the 18th century, with the exception of the tower and spire; and St. Giles's, dating from the time of Henry I., much altered at various periods, but still retaining its ancient nave and chancel. The old church of St. Chad, supposed to have occupied the site of a palace of the princes of Powis, was destroyed by the fall of the tower in 1788, and of the ancient building the bishop's chancel alone remains. The new church of St. Chad was built on another site in 1792. There are still slight remains of the abbey of Greyfriars founded in 1291, and of the Augustine friary founded in 1255. The old buildings completed in 1630 for the free grammar-school of Edward VI., founded in 1551, are now occupied by the county museum and free library, the school having been removed in 1882 to new buildings at Kingsland. Among the principal secular buildings of the town are the fine market-house in the Elizabethan style (completed according to an inscription over the northern arch in 1595), the shire hall (rebuilt in 1837, and again, after a fire, in 1883), the music-hall buildings (1840), the general market and corn exchange (1869), the working-men's hall (1863), the drapers' hall (an old timbered structure dating from the 16th century), the theatre (1834), and the post-office (1877). The principal benevolent institutions are the county infirmary (1747), Millington's hospital (1734), and the eye, ear, and throat hospital (1881). A monument to Lord Clive was erected in the market-place in 1860, and a Doric memorial pillar to General Lord Hill in 1816 at the top of the Abbey Foregate. The town racecourse occupies a portion of the "Soldiers' Piece," where Charles I. addressed his army in 1642. To the southwest of the town is a fine park 23 acres in extent, known as the Quarry, adorned by a beautiful avenue of lime trees. Formerly Shrewsbury was one of the principal marts for Welsh flannel, but this trade has now in great part ceased. Glass-staining, the spinning of flax and linen yarn, iron-founding, brewing, malting, the preparation of brawn, and the manufacture of the well-known Shrewsbury cakes are now the principal industries. The population of the municipal and parliamentary borough (area 3674 acres) in 1871 was 23,406, and in 1881 it was 26,478.

Shrewsbury, anciently called Pengwerne, was founded in the 5th century as a defence against the inroads of the Saxons, and became the seat of the princes of Powis. After its conquest by the Saxons its name was changed to Scrobbesbyrig, altered gradually into Sloppesbury, Shrewsbury, and Salop. It became one of the principal cities of the Saxon kingdom, and a mint was established there by Athelstan about 925. After the Norman Conquest it was included in the earldom of Shrewsbury bestowed by William I. on Roger de Montgomery, who erected a strong castle on the site of the ancient Saxon fortress. But in 1067 it was besieged by Owen Gwynedd, prince of Wales, till relieved by William, who marched specially to its assistance from York. On the rebellion of Robert de Belesme, son of the first earl of Shrewsbury, the castle and town were attacked by Henry I. and surrendered in 1102. During the wars of the next two centuries the town was frequently attacked and plundered by the Welsh, being captured by Llewelyn in 1215, surrendered to the English in 1221, plundered by the earl of Pembroke in 1223, burnt by Llewelyn ap Jorwerth in January, 1234, taken by Simon de Montfort in 1264, and restored to the crown in 1265. In 1267 Henry III. assembled his army there, to threaten the Welsh, but peace was restored without bloodshed, after which he strengthened its fortifications. Edward I. in 1277 made it the seat of his government, and removed to it the Courts of Exchequer and King's Bench. In 1283 he held a parliament there for the trial of David, the last of the royal princes of Wales, who was dragged through the streets of the town and afterwards hanged and quartered. At a parliament held in Shrewsbury in January, 1398, Richard II. assumed the title of Earl of Chester. Near the town was fought, 23d July, 1403, the battle of Shrewsbury, described in Shakespeare's *Henry IV.*, when the king defeated the earl of Northumberland with great slaughter, Hotspur, the earl's son, being among the slain. It became the headquarters of Charles I., 20th September, 1642, but was taken by the Parliamentarians in February, 1645. The town from the reign of William I. to that of James II. received no less than thirty-two charters, its first governing charter being obtained from Richard I. It returned two members to parliament from the reign of Edward I. until 1885, when it was allowed only one.

See Phillips, *History and Antiquities of Shrewsbury*, 1779; Owen and Blakenay, *History of Shrewsbury*, 1825; Pidgeon, *Memorials of Shrewsbury*, 1857.

SHREWSBURY, Earls of. See Talbot.

SHRIKE, a bird's name so given by Turner (1544), but solely on the authority of Sir Francis Lovell, for Turner had seen the bird but twice in England, though in Germany often, and could not find any one else who so called it. However, the word[1] was caught up by succeeding writers; and though hardly used except in books—for Butcher-bird is its vernacular synonym—it not only retains its first position in literary English, but has been largely extended so as to apply in general to all birds of the Family *Laniidæ* and others besides. The name *Lanius*, in this sense, originated with Gesner[2] (1555), who thought that the birds to which he gave it had not been mentioned by the ancients. Sundevall, however, considers that the *Malacocraneus* of Aristotle was one of them, as indeed Turner had before suggested, though repelling the latter's supposition that Aristotle's *Tyrannus* was another, as well as Belon's reference of *Collyrion*.

The species designated Shrike by Turner is the *Lanius excubitor* of Linnæus and nearly all succeeding authors, nowadays[3] commonly known as the Greater Butcher-bird, Ash-colored or Great Gray Shrike,—a bird which visits the British Islands pretty regularly, though not numerously, in autumn or winter, occasionally prolonging its stay into the next summer; but it has never been ascertained to breed there, though often asserted to have done so. This is the more remarkable since it breeds more or less commonly on the Continent from the north of France to within the Arctic Circle. Exceeding a Song-Thrush in linear measurements, it is a much less bulky bird, of a pearly-gray above with a well-defined black band passing from the forehead to the ear-coverts; beneath it is nearly white, or—and this is particularly observable in Eastern examples—barred with dusky. The quill-feathers of the wings, and of the elongated tail, are variegated with black and white, but are mostly of the former, though what there is of the latter shows very conspicuously, especially at the base of the remiges, where it forms either a single or a double patch.[4] Much smaller than this is the Red-backed Shrike, *L. collurio*, the best-known species in Great Britain, where it is a summer visitor, and, though its distribution is rather local, it may be seen in many parts of England and occasionally reaches Scotland. The cock is a sightly bird with his gray head and neck, black cheek-band, chestnut back, and pale red breast, while the hen is ordinarily of a dull brown, barred on the lower plumage. A more highly-colored species is called the Woodchat, *L. auriculatus* or *rutilus*, with a bright bay crown and nape, and the rest of its plumage black, gray, and white. This is an accidental visitor to England, but breeds commonly throughout Europe. All these birds, with many others included in the genus *Lanius*, which there is no room here to specify, have, according to their respective power, the very remarkable habit (whence they have earned their opprobrious name) of catching insects, frogs, lizards, or small birds and mammals, and of spitting them on a thorn or of fixing them in a forked branch, the more conveniently to tear them in pieces and eat them.

The limits of the Family *Laniidæ* have been very variously regarded, and agreement between almost any two systematists on this point seems at present out of the question. The latest synopsis is that by Dr. Gadow (*Cat. B. Brit. Museum*, viii. pp. 88–321), who frankly states that it is "quite impossible to give a concise diagnosis of what we are to understand by" the Family. For his purpose he makes it to include about 250 species and divides it into five sub-families: *Gymnorhininæ*, *Malaconotinæ*, *Pachycephalinæ*, *Laniinæ*, and *Vireoninæ*. Of these doubts may be entertained as to the affinity of the first and especially of the last. He, but for the crude plan to which he was compelled to conform, would not have separated *Strepera* from *Gymnorhina*; but the former had been already included, to the exclusion of the latter, among the *Corvidæ*, and even placed among the normal *Corvinæ*. The need of exercising reserve on this matter has been before stated (Crow, vol. vi. p. 545); but the number of ornithologists who think that these two genera should be placed in different Families must be small. The view taken by Prof. Parker seems to be the most reasonable: these genera—with others doubtless and most of them Australian—are morphologically inferior to the *Corvidæ*, and perhaps deserve some such designation as that of "*Noto-Coracomorphæ*" suggested by him (*Trans. Zool. Society*, ix. p. 327). At the same time their relationship to the *Laniidæ* appears to be

[1] Few birds enjoy such a wealth of local names as the Shrikes. M. Rolland (*Faune Pop. de la France*, ii. pp. 146–151) enumerates upwards of ninety applied to them in France and Savoy; but not one of these has any affinity to our word "Shrike."

[2] He does not seem, however, to have known that Butcher bird was an English name; indeed it may not have been so at the time, but subsequently introduced.

[3] According to Willughby, Rae, and Charleton, it was in their day called in many parts of England "Wierangle" (Germ. *Würgengel* and *Würger*, the Strangler); but it is hard to see how a bird which few people in England could know by sight should have a popular name, though Chaucer had used it in his *Assemblye of Foules*.

[4] On this character great store has been laid by some recent writers, who maintain that the birds presenting only a single patch, with some other minor distinctions, as the barred breast above mentioned, come from the far East and deserve specific recognition as the *Lanius major* of Pallas. But it is admitted that every intermediate form occurs, and Prof. Collett has now shown (*Ibis*, 1886, pp. 30–40) that the typical *L. excubitor* and typical *L. major* may be found in one and the same brood, and also that this occasional divergence is due neither to age nor sex. That it does depend to some extent on locality is allowed; for, though examples with the single patch (*i.e.*, *L. major*) occasionally reach Great Britain, it is asserted that nearly all the specimens from Eastern Siberia are so marked. But it is also found that by almost insensible degrees other (and sometimes more important) distinctions are manifested, and the extreme terms of the several series have been exalted to the rank of "species"—or at least local races. These are too many to be here enumerated, but it may be mentioned that the Great Gray Shrike of North America, which ordinarily has the lower plumage strongly barred, and is usually known as *L. borealis*, seems to be only one of these divergent forms, though perhaps the most divergent, as might be expected from the wholly distinct area it occupies. Yet occasionally examples occur in the Old World, which there is no reason to suppose have an American origin, indistinguishable from the typical *L. borealis*, and an uninterrupted series from one extreme to the other can be found. The differences when compared with those observable in other animals are, as a whole, too slight to justify the epithet "polymorphic" to *L. excubitor* as a species; but enough has been said to show that it indicates a tendency in that direction.

evident, and they may perhaps be best regarded as the less-altered descendants of an old type, whence both the true Crows and the true Shrikes have sprung, each to develop into higher morphological rank, and by the way to throw out numerous other branches. As to the Vireos it would seem almost certain that they have little or no connection with the *Laniidæ*.

(A. N.)

SHRIMP, the name applied to two species of Crustaceans commonly used as food in Great Britain. One kind after boiling is brown in color, the other bright red. The brown kind belongs to the species *Crangon vulgaris*, the red to the species *Pandalus annulicornis*. Both these species belong to the sub-order *Decapoda*, and to that division of it which is distinguished by a well-developed abdomen or tail, and called *Macroura*. The Crustaceans placed in this division have five pairs of limbs adapted for crawling on the sea-bottom; usually the anterior one or more pairs of these five are chelate or pincer-formed. In front of the ambulatory limbs are six pairs of limbs whose function is to assist in the conveyance of food to the mouth, three pairs of maxillipeds, two pairs of maxillæ, and a pair of mandibles. In front of these, again, are two pairs of antennæ and a pair of eyes. The latter are held by some naturalists to represent a pair of limbs, but evidence exists which is in opposition to this view. Behind the ambulatory limbs are six segments of the body, each bearing a pair of limbs adapted for swimming. The sixth pair of these abdominal limbs are larger than the rest and expanded, extending backwards in the same plane as the flattened terminal segment of the body or telson, and the three together form a powerful organ of locomotion by which a rapid backward movement of the whole body in the water is produced. The genus *Crangon* is the type of a family, the *Crangonidæ*. The most conspicuous characteristic of the genus is the shape of the first pair of ambulatory limbs. These differ less from the rest than is usually the case, and the terminal pincer apparatus is but slightly developed. The terminal joint is small, and the projection of the second joint against which it acts is still smaller, so that the cutting edges of the pincer are transverse to the rest of the limb. The second pair of limbs have also a terminal pincer apparatus, and both the second and the third are slender. The fourth and fifth pairs are short and thick. The rostrum, the median projection of the anterior part of the carapace, is rudimentary. The line joining the attachments of the two pairs of antennæ are transverse to the axis of the body. The abdomen is large. There are seven branchiæ on each side.

The specific characters of *C. vulgaris*, Fabr., are the smoothness of the dorsal surface, the carapace presenting only three small spines, one median in the gastric region and one on each side on the branchiostegite. The second pair of ambulatory limbs are nearly as long as the third. The size of the adult animal is about 2½ inches. The species is abundant on sandy shores at nearly all parts of the British and Irish coasts, and is captured by nets which have a semicircular mouth, and are attached to a pole wielded by a fisherman wading in the water at ebb-tide. The common shrimp is an exception to the general rule that the cuticle of Crustaceans is either red in the living animal or becomes so on boiling. The cuticle of *C. vulgaris* in the living state is light brown or almost white, and the animal is somewhat translucent. The color closely approximates to that of the sand on which the animal is found. After boiling the cuticle assumes its well-known brown color. Several other species of *Crangon* are known on the British shores, but none of them are as abundant as *C. vulgaris*, and they are not captured as food. *C. vulgaris* is common on the east coast of North America from North Carolina to Labrador; in the neighborhood of New York it is used as food. The species also occurs on the west coast of America from San Diego to Alaska, and is commonly eaten at San Francisco, as also is another species, *Crangon franciscorum*, Stimpson.

The genus *Pandalus*, first defined by Leach in his *Malacologia Britannica*, is chiefly distinguished by the great length of the second pair of antennæ, which are longer than the whole body, the presence of a long spiny rostrum curved upwards, the total absence of pincers on the first pair of ambulatory limbs, and the great length of the second of these limbs on the left side. The ambulatory limbs are all long and slender, and the first pair are not thicker than the rest. The second pair are provided with a very small pincer apparatus. The third somite of the abdomen is large and projects upwards, so that the body has a hump-backed appearance. The serrated upper edge of the rostrum extends backwards along the median line of the carapace, half way to its posterior border. The specific characters of the species *Annulicornis* are that the rostrum is equal in length to the carapace, and that its anterior half is destitute of teeth above, with the exception of one small tooth near the apex. This species is not so abundant as *C. vulgaris* and is an inhabitant of deeper water. It is taken usually for the market on the east and south coasts of Britain, but is widely distributed, occurring in Scotland, Ireland, Shetland, and Iceland. In color it is when alive of a reddish gray with spots of deeper red; when boiled it is of a uniform deep red. This species is sometimes confounded with the common prawn; but it never reaches the size of the prawn, its adult length being 2 to 2½ inches. *P. annulicornis* is the only species of the genus occurring in Great Britain. The common prawn when adult is above 4 inches in length. It belongs to the species *Palæmon serratus*. In *Palæmon* the second pair of antennæ are long, as in *Pandalus*, but the first pair are much larger in the former than in the latter. In *Palæmon* both of the first two pairs of ambulatory limbs are didactyle or pincer formed; the second pair are stronger than the first, and the left not longer than the right. Some of the smaller species of *Palæmon* are used as food and sometimes called shrimps. At Poole in Dorsetshire, according to Prof. Bell's *British Crustacea*, *Palæmon squilla*, Fabr., *P. varians*, Leach and *P. leachii*, Bell, are all taken, and sold as cup-shrimps.

SHROPSHIRE, or SALOP, an inland county of England, on the borders of Wales, lies between 52° 20′ and 53° 4′ N. lat. and 2° 17′ and 3° 14′ W. long., and is bounded N. by Cheshire and an interpolated portion of Flint, E. by Stafford, S. E. by Worcester, S. by Hereford, S. W. by Radnor, W. by Montgomery, and N. W. by Denbigh. The total area in 1880 was 844,565 acres, or about 1319 square miles. Plate VIII.

Towards the west Shropshire partakes of the hilly scenery of the neighboring Wales, from which several ranges are continued into it. South of the Severn on the borders of Montgomery the Breidden Hills of Lower Silurian formation rise abruptly in three peaks, of which Cefn-y-Castell, about 1300 feet high, is in Shropshire; and in the southwest there is a broad range of rough rounded hills known as Clun Forest, extending from Radnor. South and west of the Severn there are four other principal chains of hills extending from southwest to northeast—the Long Mynd (1674 feet), to the west of Church Stretton, of Cambrian formation; the Caradoc Hills, a little to the north, which cross the Severn, terminating in the isolated sugar-loaf peak of the Wrekin (1320 feet); the Wenlock Edge, to the east of Church Stretton, a sharp ridge extending for 20 miles, and in some places rising above 1000 feet; and the Clee Hills, near the southeastern border (Brown Clee Hill, 1805 feet; Titterstone Clee Hill, 1750 feet). The remainder of the county is for the most part pleasantly undulating, finely cultivated, and watered by numerous rivulets and streams. It may be said to lie in the basin of the Severn, which enters the county near its centre from Montgomery, and flows eastwards to Shrewsbury, after which it turns southeastwards to Ironbridge, and then continues in a more southerly direction past Bridgnorth, entering Worcester near Bewdley. It is navigable to Shrewsbury and has connection with the Donington, the Shropshire Union, the Shrewsbury, the Birmingham and Liverpool, and the Chester and Ellesmere Canals. Its principal tributaries within the county are—from the right the Meol (which receives the Rea), the Cound, the Mor, and the Borle, and from the left the Vyrnwy (dividing Shropshire from Montgomery), the Perry, the Tern (which receives the Roden), the Bell, and the Worf. touches the northwestern boundary of the county with Denbigh. In the south the Teme, which receives the Clun, the Onny, and the Corve, flows near the borders of Hereford, which it occasionally touches and intersects. Of the numerous lakes and pools the largest is Ellesmere (116 acres) near the borders of Denbigh. The Severn forms the boundary between the Old and the New Red Sandstone formations, which constitute the principal strata of the county. The Old Red Sandstone rocks lying to the south and west of the river are bounded and deeply interpenetrated by Cambrian and Silurian strata. There are five separate coal-fields within the county,—the Forest of Wyre, Colebrookdale, Shrewsbury, Clee Hills, and Oswestry. The Forest of Wyre field on the borders of Worcester rests directly on the Devonian rocks, and has a great thickness of measures, but comparatively few workable seams. The Colebrookdale embraces an area of 28 square miles, and is triangular in form, with its base resting on the Severn and its northern apex at Newport. On its western side it is bounded partly by a great fault, which brings in the New Red Sandstone, and partly by the Silurian strata; on its eastern side it passes beneath the Permian strata; and it is supposed that the productive measures are continued towards South Staffordshire. Its general dip is eastwards, and the strata have a vertical thickness of over 1000 feet. The organic remains include fishes, crustaceans, and molluscs. Mingled with the coal strata are several valuable courses of ironstone. The original quantity of coal in the field is estimated to have been about 43 million tons, of which there are about 12 millions now remaining. Neither the Shrewsbury nor the Clee Hills fields are of much value. The Oswestry field is small, but has some workable seams adjoining the extensive field of Denbigh. In 1884 850,000 tons of coal, valued at £286,000 [$1,389,960], were raised in Shropshire from fifty-five collieries, while 198,700 tons of iron were obtained valued at £109,285 [$531,125.10]. Iron-casting forms one of the most important industries of the county. Lead mining is carried on with some success on the Stiperstones, 3788 tons of lead ore being raised in 1884. The other principal minerals are iron pyrites (500 tons in 1884, valued at £250 [or $1215]), barytes (4939 tons, worth £7395 [or $35,939.70]), and fire-clay (56,000 tons, worth £8475 [or $41,188.50]). There are also a large number of stone and lime quarries.

Manufactures.—With the exception of iron, the manufactures of the county are comparatively unimportant. Bricks and tiles, earthen and china ware, and tobacco pipes are largely made in various districts. At Shrewsbury there are linen, yarn, and thread mills, and in several districts small paper-mills.

Agriculture.—There is much fertile land suitable for all kinds of culture, the richest soil being that in the vicinity of the Severn, including the Vale of Shrewsbury. Much of the hilly ground, including Wenlock Edge and the Clee Hills, admits of tillage; but a portion of the western mountainous region is of comparatively small value even for the pasturage of sheep. Out of a total area of 844,565 acres there were 716,509 in 1885 under culture, of which 150,085 were under corn crops, 61,101 under green crops, 426,859 under permanent pasture, 71,470 under rotation grasses, and 6978 fallow. The area under woods in 1881 was 45,641 acres, and in 1885 the area under orchards was 4015. Of corn crops the areas under wheat and barley were in 1885 nearly equal, 53,161 and 53,300 acres respectively, while that under oats amounted to 34,445 acres, rye to 848, beans 4648, and pease 3683. Nearly five-sixths of the area under green crops were occupied by turnips and swedes, which covered 47,119 acres, the area under potatoes being 6874, and that under mangold wurzel 4355. Horses in 1885 numbered 32,323, of which 19,377 were used solely for purposes of agriculture; cattle (chiefly Herefords) 162,932, of which 60,976 were cows and heifers in milk or in calf and 69,865 animals under two years old; sheep (mainly Shropshire) 438,664; pigs 61,067; and poultry 369,890. In the northern districts Cheshire cheese is largely made. According to the latest *Landowners' Return for England* Shropshire was divided among 12,119 owners, possessing 791,941 acres at an annual value of £1,484,833 [$7,216,288.38], or an average value of about £1, 16s. 8d. [$8.91] per acre. There were 7281 proprietors or about 60 per cent. who possessed less than 1 acre, and 19,675 acres were common land. The following possessed over 8000 acres each—Earl of Powis, 26,986; Duke of Cleveland, 25,604; Earl Brownlow, 20,233; Duke of Sutherland, 17,495; Lord Hill, 16,290; Lord Forester, 14,891; Lord Windsor, 10,846; Earl of Bradford, 10,515; Sir V. R. Corbet, 9489; W. O. Foster, 8547; W. L. Childe, 8430; Lord Boyne, 8424; I. D. Corbet, 8118.

Administration and Population.—Shropshire comprises 14 hundreds and the municipal boroughs of Bridgnorth (population, 5885 in 1881), Ludlow (5035), Oswestry (7847), Shrewsbury (26,478), and Wenlock (18,442). For parliamentary purposes the county, which was formerly shared between North and South Shropshire, was in 1885 divided into four separate divisions,—Mid (Wellington), North (Newport), South (Ludlow), and West (Oswestry), each returning one member. At the same time the boroughs of Bridgnorth, Wenlock, and Ludlow were merged in the county divisions to which they severally belong; but Shrewsbury continues to return one member. Shropshire contains also the following urban sanitary districts: Broseley (population, 4458 in 1881), Dawley (9200), Ellesmere (1875), Madeley (9212), Much Wenlock (2321), Newport (3044), Wellington (6217), and Whitchurch and Dodington (3756). The county has one court of quarter sessions, and is divided into nineteen special sessional divisions. All the boroughs have separate courts of quarter sessions and commissions of the peace. The county contains 252 civil parishes with parts of six others. Ecclesiastically it is in the dioceses of Hereford, Lichfield, and St. Asaph. The population (240,959 in 1861) in 1881 was 248,014 (124,157 males and 123,857 females). The number of persons to an acre was 0.29 and of acres to a person 3.41.

History and Antiquities.—The British tribes inhabiting Shropshire at the time of the Romans were named by them the Ordovices and the Cornavii. It was within its boundaries that Caractacus (Caradoc) struggled against Vespasian in 51 A.D. A connected chain of military works was erected by him over the southern and western districts of the county, the most important fortresses being Caer Caradoc (where he is said to have made his last stand), occupying a commanding position in the forest of Clun, and the earthwork of Hên Dinas at Old Oswestry, consisting of four or five concentric circles, still well marked. The Roman Watling Street entered Shropshire near Weston-under-Lizard in Stafford and passed in an oblique line to Leintwardine in Hereford. Various other Roman roads diverged from it in different directions. Wroxeter, a little to the west of the Wrekin, occupies the site of the ancient Roman city Uriconium, of which a portion of the wall, originally 3 miles in circumference, still remains. Explorations made on the site of the city have revealed many interesting features of its construction, and have led to the discovery of an immense variety of remains. By some authorities the Roman Mediolanum is placed near Drayton and Rutunium near Wem; but the evidence in both cases is doubtful. Throughout Shropshire there are many remains of Roman camps. Under the Romans it was included in the province of Flavia Cæsariensis. After their departure it was annexed to the kingdom of the Saxons by Offa, who about 765 caused Watt's dyke to be erected to guard against the incursions of the Welsh, and later erected parallel with it, 2 miles to the west, the entrenchment known as Offa's dyke, which, extending from the Wye near Hereford to the parish of Mold in Flintshire, forms in some places a well-defined boundary between Shropshire and Montgomery. The greater part of the history of Shropshire is included under that of SHREWSBURY (*q.v.*). There are several important old ecclesiastical ruins, including Wenlock priory, once very wealthy, said to have been founded by St. Milburg, grand-daughter of Penda, king of the Mercians, as a college for secular priests, and changed into a priory for Cluniac monks by Roger de Montgomery about 1080; Lilleshall abbey, for Augustinian canons, founded in the reign of Stephen; Shrewsbury abbey, founded in 1083 in honor of St. Peter and St. Paul; Buildwas abbey, one of the finest ruins in the county, founded in 1135 for Cistercians by Roger de Clinton, bishop of Chester; and Haughmond abbey, for Augustinian canons, founded by William Fitzalan about 1138. Other remains of less consequence are those of the convent of White Ladies or St. Leonard's, a Norman structure, said to have been founded in the reign of Richard I. or John; slight traces of Wombridge priory, for Augustinian canons, founded before the reign of Henry I.; Alberbury priory, for Benedictines, founded by Fulk Fitzwarin between 1220 and 1230; and Chirbury priory, founded towards the close of the 12th century. The castles of Bridgnorth (see BRIDGENORTH), Ludlow, and Shrewsbury are referred to in the notices of

these towns, and in addition to these may be mentioned Clun Castle, which after a long siege was taken and burnt by the Welsh prince Rees about 1196, and Boscobel House, near which Charles II. is said to have been sheltered in an oak.

SHROVE TUESDAY, the day preceding Ash Wednesday, or the first day of Lent, was so called as the day on which "shrift" or confession was made. Compare CARNIVAL.

SHUMLA (Bulg. *Shumen*, Turk. *Shumna*), a fortified town of Bulgaria, 58 miles south-southwest of Silistria and in that pashalic and 50 west of Varna. The town is built within a cluster of hills which curve round it on the west and north in the shape of a horse-shoe. A rugged ravine intersects the ground longitudinally within the horse-shoe ridge. From Shumla roads radiate northwards to the Danubian fortresses of Rustchuk and Silistria and those in the Dobrudja, southwards to the passes of the Balkans, and eastwards to Varna and Baltchik. Shumla is therefore one of the most important military positions to the north of Turkey, while it ranks as the third largest town in Bulgaria. Spread over a large extent of ground, each house mostly isolated in the midst of its own stables and cow-houses, Shumla has the appearance of a vast village. A broad street and rivulet divide the military or upper quarter, Gorni-Mahlé, from the lower quarter, Dolni-Mahlé. The latter, dirty and unhealthy, intersected by a labyrinth of lanes, is inhabited mostly by Christians and Jews. The Armenians possess a small church, and each of the two Bulgarian quarters has its temple. The houses of the Gorni-Mahlé, occupied chiefly by Turks, stand pleasantly embowered each in its flower and fruit garden. Gorni-Mahlé has preserved the old church of the Resurrection. In the Dolni-Mahlé is the new church of St. Cyril, a fine basilica adorned with a peristyle. The Bulgarian community possesses two boys' and two girls' schools, giving instruction superior to that obtainable at the primary Turkish school. In the upper part of the town is the magnificent mausoleum of Jezairli Hassan Pasha, who in the 18th century enlarged the fortifications of Shumla. The principal mosque, with a cupola of very interesting architecture, forms the centre of the Moslem quarter. At the farther end of the town, isolated on a hill, is a large military hospital. The population of Shumla in 1881 was 23,093, exclusive of the garrison. The town is renowned for its manufacture of red and yellow slippers, ready-made clothes, richly embroidered dresses for females, and its copper and tin wares. It also rears silk-worms, spins silk, and carries on an important trade in grain and wine. The branch railway from Shumla to Kaspidjan, 9½ miles, to connect the town with the Rustchuk-Varna Railway, though commenced in 1870, was not finished in 1886.

In 811 Shumla was burned by the emperor Nicephorus, and in 1087 was besieged by Alexius. In 1388 the sultan Murad I. forced the castle to surrender; and thence till the 17th century Shumla disappears from history. In the 18th century it was enlarged and fortified. Three times—1774, 1810, and 1828—it was unsuccessfully attacked by Russian armies. The Turks consequently gave it the name of Gazi ("Victorious"). But on 22d June, 1878, Shumla capitulated to the Russians. The treaty of Berlin stipulated the demolition of the fortifications; but this article has not been executed, and Bulgarian troops garrison the fort.

See F. Kanitz, *La Bulgarie Danubienne* (1882): H. C. Barkley, *Bulgaria before the War* (1877), and *Between the Danube and Black Sea* (1876); S. G. B. and C. A. St. Clair, *Residence in Bulgaria* (1869); J. L. Farley, *New Bulgaria* (1880); and J. G. Minchin, *Bulgaria since the War* (1880).

SHUSHA, a town, formerly a fortress, of Russia, in the Caucasian government of Elisabethpol, lies in 39° 46′ N. lat. and 46° 25′ E. long., 230 miles southeast of Tiflis, on an isolated rocky eminence, 3860 feet high. The town, which is accessible only on one side, occupies but a small part of the plateau, whence there is a splendid view over the surrounding mountain gorges and defiles. In 1873 the population was 24,552 (males 13,666, females 10,886), of whom 13,504 were Armenians and 10,804 Tatars. Instead of flat earthen roofs, as in most other towns of Transcaucasia, the houses have very high steep roofs, covered with shingle. The streets are sinuous, and are intersected by ravines. Shusha was formerly the capital of the khanate of Karabagh. The town is locally renowned for its carpet manufactures, and the district for its excellent breed of Karabagh horses.

The fortress, formed in 1789 by Paua Khan, has a wall on one side, and is defended naturally on the other three sides. In 1795 Shusha successfully withstood a siege by Agha Mohammed of Persia, but was constrained to surrender two years afterwards. In 1805 Ibrahim Khan of Karabagh invoked the protection of Russia, but the annexation was completed only in 1822. The present district of Shusha (2934 square miles) forms only a part of the former khanate of Karabagh. In 1873 it had (exclusive of Shusha) a population of 80,913 (males 45,163, females 35,750), Armenians numbering 43,562 and Tatars 37,351. Agriculture and cattle breeding are almost the sole occupations of the inhabitants. General culture is very low: there is no enterprise, and but inadequate security for life and property.

SHUSTAR, or SHÚSTAR, SHÚSHTAR (Arab. *Tostar*), once a flourishing provincial capital of Persia, is now a comparatively unimportant town of 6000 inhabitants,—exclusive, however, of the Bakhtiáris, who during the winter months encamp with their flocks and herds in the immediate vicinity. It is situated (32° 3′ 30″ N. lat. and 48° 52′ E. long.) at the foot of an offshoot of the Bakhtiári Mountains in the northwest of Khuzistán and just below the point in the Kárún (Dojail or Little Tigris) where—the main stream running westwards—a cutting of 70 feet deep has been made through the natural rock for an easterly branch. Thence the two streams, enclosing a wide alluvial tract, of which Shustar is the crown, follow independent courses until they reunite some 40 miles to the south. According to Lieutenant Selby, I. N., who ascended the Kárún from Muhamrah (Mohammera) in 1842 by the Shutait (or main stream on the west) to within 6 miles, and further tested the navigation of the Ab-i-Gargar (or eastern channel) to within 1 mile, of Shustar, the town is built on a small hill which rises gradually from the southwest and increases in elevation to the citadel, which presents on the northeastern side an abrupt face of about 150 feet in length, having the river immediately beneath. Mr. Loftus, who visited Shustar some eight years after Lieutenant Selby, gives an account of the two great dams thrown across the river,—the "Band-i-Mizán" over the natural course, the "Band-i-Kaisar" over the artificially diverted branch. About a mile below the latter is a similar work of more recent and more solid and substantial construction, called the "Púl," or bridge of Belaiti. Legend ascribes these ancient works to Shápúr I. and his captive the emperor Valerian. In 1875, and again in 1878, Mr. Mackenzie visited Shustar; he speaks of the town as being in a wretchedly decayed and filthy condition. The houses are of stone, some few good, with underground rooms (*sardábs* or *zír zamin*) excavated to a depth of two stories below the ground level. In these relief is obtained from the intense summer heat. The traffic of the bazaar, which is a poor one, seemed to depend chiefly on the Iliyáts or wandering tribes. The inhabitants—for the most part Arabs and Sáiyids—have a reputation for hospitality.

Some writers have identified Shúshar with Susa (Shushan of the Bible), the capital of Susiana and a residence of the Achæmenian kings. The true site of the latter, however, as Loftus's explorations showed, is at Shúsh, a widely spread ruin 30 or 40 miles to the northwest. On the other side of Shustar is the locally classic ground of Rám Hormuz. In fact, of the whole neighborhood Sir H. Rawlinson writes that it "still requires elaborate exploration, and would well repay any traveller who would devote six months to examining the ruins and carefully copying the inscriptions."

The river Karún, which rises in the Bakhtiári Mountains and passes down the broad Shattu 'l-'Arab, joins the Tigris and Euphrates. It has been declared by many and trustworthy authorities to be well adapted for steam navigation—save as regards one obstacle at Ahwaz, removable at little cost—from its mouth to the near neighborhood of Shustar. Thence to Ispahan the land journey would be shorter than from Bushahr (Bushire) to that city by 200 miles.

SHUYA, one of the chief centres of the cotton industry in middle Russia, is a district town in the government of Vladimir, 68 miles northeast of the town of Vladimir. A branch railway connects it with the Novki station of the railway from Moscow to Nijni-Novgorod. The town is built on the high left bank of the navigable Teza, a tributary of the Klazma, with two suburbs on the right bank. Annalists mention princes of Shuya in 1403. Its first linen manufactures were established in 1755; but in 1800 its population did not exceed 1500. Its growth began only with the development of the cotton industry in central Russia, and since then has been rapid; in 1882 it had 19,560 inhabitants, as against 10,440 in 1870. Of these about 10,000 live by the manufactures, and only a few keep to agriculture and gardening. In 1881 the output of twelve cotton-mills was valued at £442,160 [$2,148,897.60] for various cotton stuffs and £48,000 [$233,280] for cotton yarns. Tanneries, especially for the preparation of sheepskins—widely renowned throughout Russia—still maintain their importance, although this industry has migrated to a great extent to the country districts. The products of its manufactories are chiefly sent to Moscow and Nijni-Novgorod. The town is mainly built of wood. Its cathedral (1799) is a large building, with five gilt cupolas. Shuya has also two gymnasia, for boys and girls, besides a progymnasium for girls, and several secondary and primary schools.

The surrounding district is also important for its manufactures. The village of Ivanovo-Voznesensk, north of Shuya, with a population of more than 19,000 inhabitants, employed 11,329 workmen in its 39 manufactories in 1881, and showed a return of £1,939,950 [$9,428,157] (£1,700,000 [$8,262,000] for cottons and the remainder for chemicals and machinery). Teikovo and Kokhma are two other centres of manufacture,—the whole production of the manufactories within the district (exclusive of Shuya and Ivanovo) being estimated at £630,000 [$3,061,800]. These figures, of course, do not include any statistics of the petty trades carried on side by side with agriculture. Nearly every village has a specialty of its own—bricks, pottery (Menschikovo), wheels, toys, packing-boxes, looms and other weaving implements, house furniture, sieves, combs, boots, gloves, felt goods, candles, and so on. The manufacture of linen and cotton in villages, as well as the preparation and manufacture of sheepskins and rough gloves, occupies about 40,000 peasants. The Shuya merchants carry on an active trade in these products all over Russia, and in corn, spirits, salt, and other food stuffs, which are imported to a great extent. In 1880 the imported goods reached 1,613,000 cwts. (1,208,000 by rail), and the exports 1,318,000 cwts., chiefly by the Teza.

SHWE-GYENG, a district of British Burmah, in the Tenasserim division, containing an area of 5567 square miles, and lying in the valley of the Tsit-toung (Sitoung) river. It is bounded on the N. by Toungguú district, on the E. by the Poung-loung Hills and the Salwin Hill Tracts, on the S. by Amherst district, and on the W. by the Pegu Yoma Hills. The boundaries have more than once been altered, the last change having taken place in 1877. The aspect of the country is mountainous, especially in the north. The Tsit-toung is navigable throughout its entire length in the district by large boats and steam-launches. Shwe-gyeng has never been accurately surveyed from a geological point of view, but is supposed to be rich in minerals. Gold is found in most of the affluents of the river Shwe-gyeng; copper, lead, tin, and coal also exist, but are not worked. Except in the hills, the climate is generally healthy; the average annual rainfall at Shwe-gyeng station is 144 inches.

In 1881 the population of the district was 171,144 (89,687 males and 81,457 females) of whom Hindus numbered 958, Mohammedans 855, Buddhists 158,149, and Christians 1250. The only town with more than 5000 inhabitants is Shwe-gyeng, the capital and headquarters of the district, which was founded during the 18th century, before the Burmese conquest, by Alompra. It is situated at the junction of the Shwe-gyeng with the Tsit-toung, and had a population of 7519 in 1881. Only 187 square miles of the district were cultivated in 1883–84; the cultivated area is, however, gradually extending, and there are some 3474 square miles capable of cultivation. The principal crop is rice, of which twenty-five different kinds are grown; other products are cotton, betel-nuts, tobacco, and sugar-cane. The only industries are potteries, salt-making, and silk-spinning. In 1883–84 the total revenue amounted to £36,476 [$177,273.76], of which the land-tax contributed £15,967 [$77,599.62].

SIÁLKOT, or SEALKOTE, a district of British India, in the Amritsar division of the lieutenant governorship of the Punjab, with an area of 1959 square miles. It lies between 31° 44′ and 32° 50′ N. lat. and 74° 12′ and 75° 3′ E. long., and is bounded on the N.E. by the Jámu state of Kashmir, on the N.W. by the Chénab, on the E. by Gurdáspur, on the S.E. by the Rávi, and on the W. by Lahore and Gujránwála. Siálkot is an oblong tract of country occupying the submontane portion of the Rechna (Rávi Chenáb) Doáb, and is fringed on either side by a line of fresh alluvial soil, above which rise the high banks that form the limits of the river beds. The Degh, which rises in the Jámu Hills, traverses the district parallel to the Rávi, and is likewise fringed by low alluvial soil. The northeastern boundary of Siálkot is 20 miles distant from the outer line of the Himálayas; but about midway between the Rávi and the Chenáb is a high dorsal tract, extending from beyond the border and stretching far into the district. Siálkot is above the average of the Punjab in fertility: three-fourths of its area have already been brought under the plough, and a third of the remainder is reported to be capable of improvement. The upper portion of the district is very productive: but the southern portion, farther removed from the influence of the rains shows a marked decrease of fertility. The district is also watered by numerous small torrents; and several swamps or *jhils*, scattered over the face of the country, are of considerable value as reservoirs of surplus water for purposes of irrigation. Siálkot is reputed to be healthy; it is free from excessive heat, judged by the common standard of the Punjab; and its average annual rainfall is about 37 inches.

The district possesses a total length of 790 miles of road; and a branch line of the Punjab Northern State Railway, from Wazirábád in the northwest corner of the district to Siálkot town (28 miles), was opened in January, 1884. In 1881 the population was 1,012,148 (males 539,661, females 472,487) of whom Mohammedans numbered 669,712, Hindus, 299, 311, Sikhs 40,195, and Christians 1535. The only town of any importance is SIÁLKOT (*q.v.*). The principal agricultural products of the district are wheat, barley, rice, maize, millets, pulses, oil-seeds, sugar-cane, cotton and vegetables. The local commerce centres in the town of Siálkot, which gathers into its bazaars more than half the raw produce of the district. Its surplus stock finds a ready outlet in the markets of Lahore and Amritsar, while the great rivers on either side form natural channels of communication with the lower parts of the Punjab. The native manufactures comprise silk, saddlery, shawl edging, coarse chintzes, pottery, brass vessels, country cloth, cutlery, and paper. The gross revenue of the district in 1883–84 amounted to £145,531 [$707,280.66], of which the land-tax contributed £111,713 [$542,925.18].

The early history of Siálkot is closely interwoven with that of the rest of the Punjab. It was annexed by the British after the Second Sikh War in 1849; since then its area has been considerably reduced, assuming its present proportions in 1867. During the mutiny of 1857 the native troops stationed in the cantonments of Siálkot besieged the European residents in the fort, and remained masters of the whole district; they also plundered the treasury and destroyed all the records.

SIÁLKOT, the capital and administrative headquarters of the above district, is situated in 32° 31′ N.

lat and 74° 36′ E. long., on the northern bank of the Aik torrent. It is an extensive city with handsome and well-built streets, and contains several shrines and buildings of historical interest. In 1881 its population was 39,613.

SIAM.[1] The kingdom of Siam embraces the greater part of the Indo-Chinese and part of the Malay peninsula. On the northwest the river Salwín separates it from Karen-nee, southwards thence the river Toon-gyeen; then, from the Three Pagodas in 18° 15′ N. lat. down to the Pak-chan river in 10° N. lat., the principal watershed separates it from Pegu and Tenasserim. Its seaboard on the Bay of Bengal extends from the Pak-chan river to Wellesley Province in 5° 30′ N. lat.; but the islands along the coast are British. On the other (east) side of the peninsula the territory extends to 4° 35′ N. lat., or, if the vassal state of Pahang is included, to Johore in about 2° 30′ N. lat. On the east side of the Gulf of Siam the frontier line (according to the Siamese authorities; cf. Plate IX.) starts from the Bay of Compong Som in 103° 20′ E. long., and runs north inland to Mount Pang-chak, thence, after crossing Tonle-sap Lake, east across the Me-kong to the crest of the range which separates the Me-kong valley from Anam. It then follows this range north, including the country northeast of Luang Prabang, to the frontiers of Tongking. Thence it runs west-southwest, separating the tributary from the independent or Burmese Shan states, and meets the Salwín in about 20° N. lat.

Plate IX.

Boundaries.

The great natural and economical centre of Siam is the delta of the Me-nam river, which is annually flooded between June and November, the waters attaining their greatest height in August. The inundation covers several thousand square miles, so that the capacity for production of rice, which furnishes two-thirds of the entire exports, is almost unlimited, but is very partially developed both from scarcity of population and want of means of transport, mills, and better cultivation. Irrigation channels are, however, cut above the point where the creeks naturally cease by some of the small Chinese settlers. The bar formed at the mouth of this and of the other converging rivers—the Tachim, the Me-klong, and the Pechaburi on the west, and the Kharayok on the east—extends right across the upper end of the gulf, and has 12 or 13 feet of water at high water. The yearly encroachment of the land on the sea is considerable, and the entire delta from Chein-nat in 15° 20′ N. lat. downwards has probably been formed in comparatively recent times. At Bangkok sea-shells are found 20 feet below the surface. The Tachim, the first great branch of the Me-nam, joins its right bank above Chein-nat; below this the main stream anastomoses naturally or by canals freely, the banks of the different channels being densely peopled. Above Chein-nat the Me-nam continues deep and navigable up to the junction of the Pak-nam Pho, its east branch being formed by several important affluents from the northeast. The west branch of the Me nam is formed mainly by two affluents, the Me-wang and the Me-ping, which flow down through the west Laos states, some of whose chief towns are situated on their banks. In this more elevated region the hill ranges, with a general north-south direction, ramify widely, rising in places to from 6000 to 8000 feet, while the valleys between them widen out into great fertile plains, having the appearance of former lake-basins—a view which coincides with ancient local traditions. On the west frontier the rapid and broken stream of the Toon-gyeen, whose tributary valleys on the Siamese side produce valuable teak and cinnamon, flows from a mass of laterite, south of which the central range consists of granite, with syenite and quartzose rocks. Its spurs (6000 feet high) extending in every direction, of sandstones, Carboniferous limestones, and other Secondary formations, are clothed with sappan and other forest trees, and contain probably gold, besides argentiferous lead, tin, coal, and iron, the latter in nodules of clay oxide and brown hematite. On the west of the Gulf of Siam, as far south as 11° N. lat., is a dry barren region, enclosed between two ranges which intercept the rainfall on either side, but farther south are luxuriant damp forests containing *Hopea* (wood-oil), iron-wood, etc., with occasional clearings for cultivation, and many rivers with wide mouths, but becoming mere streams higher up.

Rivers.

In about 10° 30′ N. lat. the Malay peninsula is narrowed by a river at either side to a width of only 27 miles, and there a survey for a canal has been made; the maximum height of the section is 250 feet, the mean 130; the amount of excavation is estimated at 84 million cubic feet, mostly through hard rock, and the cost at £20,000,000 [$97,200,000]. But the approaches by the river mouths on both sides are intricate and bad. This has latterly been the chief route across the peninsula; but there are other breaks in the range which forms the backbone of the peninsula, and the Buddhist propaganda is said to have crossed by the isthmus of Ligor. Here, however—perhaps, properly speaking, in Junk Ceylon Island—is the real termination of the great range which comes down unbroken from Yun-nan, separating the Salwín and the Me-nam valleys.

Isthmus of Kra.

East from the plain of the Me-nam, and separating it from the Me-kong valley, a plateau rises with very gradual ascent, clothed to a width of from 30 to 50 miles with forest. From its east side several large and partly navigable rivers flow towards the Me-kong through a sandy and for the most part arid plain, with stunted growth of resinous trees and bamboos, brushwood and grass; but on the lower courses of some of these streams are rich irrigated tracts, producing rice, bananas, sugar, maize, and the usual tropical vegetables. The whole region is very unhealthy, especially in the wet season. Travelling would hardly be possible without elephants, of which some are kept in every village. The rocks are mostly calcareous or sandstone, and at the south edge of the plateau corals and recent shells at a slight depth show the former limits of the land. Farther north the mountains of Pechaboun and Lom are rich in magnetic iron ore, argentiferous copper, antimony, and tin. Only the first-named is worked to any extent; and, though by very primitive methods, a large quantity of tools and weapons are manufactured. From the south of the plateau a range sweeps round to the southeast into Cambodia, outliers from which are the two peaks north and east from Chantaboun, the latter noted for its emeralds, topazes, and sapphires. Isolated hills, apparently volcanic, occur, as the sacred Mount Phrabat, to the northeast of Ayuthia, where there are hot springs and a famous footprint of the Buddha, and the conical hills at Pechaburi in the southwest, consisting of lavas, scoriæ, and trachytic rocks, abounding in caverns elaborately fitted as temples.

Eastern Siam.

Tin is extensively distributed, especially throughout the Malay peninsula, where it is worked at Bang-ta-phang in the province of Chumphon, at Chaija and Chaliang, also on the Me-klong, at Kanburi, and at Rapri. Gold is found pretty extensively in Tringanu and Pahang; there are mines at Bang-ta-phang; and it is extracted in the Me-kong valley by washing or with mercury. Most of it is consumed in trinkets and presents given by the king,—gold leaf being imported from China for gilding pagodas, etc. Iron abounds in the east, as at Lom and Mulu Prey, antimony at Rapri, lead at Pak-phrek and Suphan, silver in the Me-pik valley. Both the lead and copper ores are often argentiferous.

Minerals.

Much of the natural rainfall in Siam is intercepted by the high lands of the Malacca peninsula and by the mountains on the northwest and north, while the proximity of the Gulf of Siam tempers the heat. The rainfall at Bangkok on an average of ten years is 67.04 inches, of which 50.59 inches fall from May to October in-

clusive.[1] The mean annual temperature is 80.1°, varying from 74.8° in December to 83.4° in April; the lowest recorded absolute minimum was 57° in December, 1866, the highest recorded absolute maximum 97.5° in May, 1867. The northeast monsoon begins to blow early in November, preceded by a month of variable weather. It has lost half its force in January, and by March strong south and south-southwest winds have set in, the southwest monsoon blowing then steadily and strongly till September. Thus there are three seasons of four months each,—the hot, rainy, and cold.

Fauna.

As to general features, the fauna of Siam is identical with that of Burmah and of southern China, and is one of the richest in the world. Elephants are very numerous in the south and east, but are not found so far north as in India. They are as intelligent as the Indian, but usually less highly trained. White (albino) monkeys are sacred, as are the elephant, an iguana which lives in the house and kills rats and other vermin, and the crow; white ants' nests are respected as resembling pagodas, so that libraries are often kept in tanks to escape the ants' ravages.

Flora.

The flora is very similar in character to that of Burmah and has much in common with the Chinese, the transition to which is almost insensible. The coast region is characterized by mangroves, pandanus, rattans, and similar palms with long flexible stems, and the middle region by the great rice-fields, the cocoa-nut and areca palms, and the usual tropical plants of culture. In the temperate uplands of the interior, as about Luang Prabang, Himalayan and Japanese species occur,—oaks, pines, chestnuts, peach and great apple trees, raspberries, honeysuckle, vines, saxifrages, *Cichoraceæ*, anemones, and *Violaceæ*; there are many valuable timber trees,—teak, sappan, eaglewood, wood oil (*Hopea*), and other *Dipterocarpaceæ*, *Cedrelaceæ*, *Pterocarpaceæ*, *Xylia*, iron-wood, and other dye-woods and resinous trees, these last forming in many districts a large proportion of the more open forests, with an undergrowth of bamboo.

Trade.

Numerous caravans of cattle, horses, mules, and porters pass annually from Yun-nan (southwest China) to the northern (Siamese) Shan states, whence many of them proceed *via* Chieng-mai to Moulmain (Maulmain). They bring from China silk goods, tea, opium, and brass wares, and take back raw cotton, deer and rhinoceros horns, ivory, and saltpetre. The northern states, which are a great breeding-ground for cattle and ponies—elephants too are exported into Burmah—send down teak and other produce. The proposed railway from Moulmain *via* Myawaddi to Raheng, and thence to Kiangsen, 190 miles from the Chinese frontier, is intended to stimulate not only the traffic with China but the local resources (see address by Mr. Holt Hallett, C.E., in *London Chamber of Commerce Journal*, 5th May, 1885). The eastern states, comprising nearly half the area and a considerable part of the wealth of the kingdom, send much produce *via* Korat to Bangkok. They produce chiefly China grass (*Bæhmeria nivea*), sugar, indigo, silk, cardamoms, cotton, tobacco, sisiet (a substitute for betel), beeswax, benzoin, lac, iron, lime, sulphur, salt, coarse pottery, mats, hides, tigers, and bones, horns, and tusks of elephants, rhinoceroses, and boars. European cottons and hardware and Chinese goods penetrate everywhere, the chief entrepôts being Nangkoi in the east and Chieng-mai in the west. The eastern plains produce alternate crops of rice and salt. The rains dissolve the salt in the soil and wash it down, making cultivation possible. In the dry season the salt comes up again and is swept up from the surface. Much alcohol is distilled and consumed. Vast quantities (6900 to 7900 tons) of dried fish are prepared at Lake Tonle-sap, and at fisheries on the coast.[2] Although silk has been known from remote antiquity, it is produced exclusively by the Lao communities settled throughout the country,—the chief centres being Korat and Battampong. The export in 1884 was 325 cwts., valued at £19,890 [$96,665.40]; but the best quality hardly reaches the Bangkok market, its natural bright yellow color making it difficult to dye. There is, however, not much of it, the demand for the better kinds being supplied from Cambodia. But for the apathy and indolence of the people the production might be largely increased; the spinning and reeling apparatus too are very primitive, though some beautiful cloths are woven at Chieng-mai. Much of the trade in teak and cattle is worked by Burmese; otherwise almost all the trade of the country is in Chinese hands. In some of the remoter districts barter is resorted to, beeswax, salt, lac, and bars of iron being mediums of exchange; but generally silver is used, and sometimes Indian rupees. Civilization increases in the eastern districts as the frontier of China is approached. In 1884 419 vessels cleared from Bangkok with cargoes valued at £27,170 [$132,046.20]; of these 240 (tonnage, 151,984) were British. In addition, there were 143 junks (tonnage, 3350). The total value of the exports was £2,262,240 [$10,994,486.40], rice being the principal item, £1,444,200 [$7,018,812]. The imports were valued at £1,044,255 [$5,075,079.30], the chief items being—gray and white shirtings, £161,997 [$787,305.42]; opium (704 chests), £81,410 [$395,652.60]; chowls, *i.e.*, shawls, a cotton cloth from Bombay, £105,264 [$511,583.04]. In 1885 the exports were valued at £1,907,006 [$9,268,049.16], and the imports at £1,380,233 [$6,707,932.38]. The exports being in excess of the imports, the difference is paid in Mexican dollars, which are melted down and re-coined,—the silver coinage being the standard of weight.

Exports and imports.

Coinage and weights.

The money and weights seem to be the same as the Old Cambodian. A copper coinage has replaced the cowries, and there is also a silver coinage, viz., the fuang = 7½ cents, the salung = 15 cents, the bat or tikal = 60 cents or half a crown, 5 tikals = 3 Mexican dollars. From the tikal upwards these coins are also used as measures of weight. Thus 1 tikal weighs 15 grammes or 231 grains, 4 tikals = 1 tamlung, 20 tamlungs = 1 chang or catty, or two Chinese catties = 3.2 lb. There are a few gold coins, but not in general circulation. Their value is sixteen times their weight in silver.

Taxation.

The land-tax is fixed at ten per cent., the first person who clears land being entitled to hold it. The tax on garden produce and on fruit trees is higher, but is fixed at intervals of some fifteen years, or at the beginning of a reign. There is a *corvée* of four months in the year, to which all classes except the nobles and the priesthood are theoretically liable, but it may be commuted for a poll-tax of from 6 to 18 tikals [$3.60 to $10.80], payable either directly in money to Government or to the feudal superior, for all except the nobility are thus dependent on a superior; in the provinces it is payable in kind through the governor. A smaller amount, 1½ tikals [90 cts.], is payable by masters for their slaves. But there are some considerate exceptions, viz., persons over sixty or under eighteen years of age, or who have three sons paying the tax, and cases of incurable illness. If a special demand for labor be made there is exemption from poll-tax for that year. The Chinese only pay 4½ tikals [$2.55] triennially, and Europeans are exempted. There is a tax on houses, on amusements (theatricals, dancers, etc.), and on fishing-boats, nets, and other tackle. There is a royalty on tin, and the sale of opium and of alcohol is a Government monopoly, farmed to Chinese. Three per cent. is levied by treaty on British and other foreign imports, export duties on a great number of raw articles, and inland or transit dues on certain tropical products. The revenue from all these sources is estimated at 80,000 catties (£800,000 [$3,888,000]).

Administration.

The head of the administration is the king, with five ministers,—viz., of war, foreign affairs, northern provinces, agriculture, justice,—and some thirty councillors. The office known to Europeans as "second king" (Siamese, *wang-na*, lit., "front palace") is difficult to define, as the share taken in government by him depends very much on his individual character. He has a palace and an official establishment, and a few soldiers at his orders. The country is divided into forty-one provinces, excluding the Laos and Malay states, and the Cambodian provinces. The provinces are of different grades, and their governors have very different degrees of authority. Speaking generally, they have cognizance of all civil cases, —though there is an appeal to the capital (which generally reaches its destination, as the governor's council act as spies),—and of minor criminal cases. The graver crimes, as murder and dacoity, involving a question of life or death committed in Siam proper, are referred to a special department in the capital. Villages are governed by a head-man (*kamnan*, *amp'hon*, or *nakhon*), sometimes with a small salary, chosen usually in accordance with the popular wish, and dependent on the provincial capital. The Siamese mandarins in the Lao provinces do not oppress overmuch, nor do the native chiefs, since their power depends on their popularity. Besides the lower grades there are always four principal officials, the *chao*, lord or king, the *uparat*, *rachavangsa*, and *rachabutr* (the first title of Chinese, the others of Indian origin). These are hereditary in one or two families, any disputed succession being referred to Bangkok. The Siamese law is recognized, but the national "customs" are much regarded, and in ordinary cases followed. Civil and criminal processes alike end usually in a fine. Besides the capitation tax, there is a duty on rice, and each state

[1] But on the neighboring ranges the fall is, at Moulmain 244 inches, at Tavoy 202, at Mergui 185.

[2] During the floods vast quantities of fish swarm into the rice-grounds and are caught when the water recedes, furnishing a valuable and abundant food-supply

pays tribute to Bangkok. The tie between Bangkok and the Malay states is slighter, being confined usually to interference in cases of disputed succession, and to a triennial tribute of a gold or silver tree or flower. The rules of procedure in Siam are very strict, but theoretically there is no hereditary rank.

Laws.

The laws of Siam are ancient, though not very full or complete, a great part having been lost at the sack of Ayuthia in 1753. Generally speaking, they are referable to an Indian origin, especially as regards religious, moral, and ceremonial ordinances; the civil and criminal codes bear the impress of Chinese influence. There are several digests of the law, some centuries old, under systematic headings, *e.g.*, of the civil law, real and personal property, inheritance, ranks, evidence and ordeal, marriage, education, parental authority, slavery, money, weights and measures, contracts, and of the penal code, crimes, punishments, police, prisons. The king is absolute, but claims no absolute rights over the land. Great attention is paid to precedents. Among the peculiarities of the system are the employment of ordeal—by diving or chewing rice, etc.—in the absence of witnesses, and the rejection of the evidence of certain classes, viz., drunkards, gamblers, virgins, executioners, beggars, persons who cannot read, and bad characters. When a crime is committed the family and even the neighbors of the accused can be held responsible for his appearance. The property of intestates goes to the king, of an intestate priest to his monastery; but the neglect of the heir to perform funeral rites renders his claim to property invalid,—a curious relic of Hindu feeling. Another trace of this may be found in the hereditary professions, though their doctrinal significance as castes has disappeared. The laws have many curious and not inequitable provisions about slavery (see below), *e.g.*, if a temporary (debtor) slave has undergone punishment or suffering for his master, his debt shall be remitted wholly or in part; but if he is a slave absolutely, his master is not legally liable. And there are well-defined rules as to non-fulfilment of contract with a slave, his maintenance during famine, injury by accidents, employment as a substitute in war, etc. Slaves who are allowed to become priests or nuns are free.

Army and navy.

All men are liable to serve in war; but only from 4000 to 5000, taken from classes specially at the disposal of the war department, are regularly trained under European officers. The capital and surrounding forts are garrisoned, and there is a body of palace guards. The fleet consists of some twenty men-of-war and armed steamers and 500 junks.

Population.

The population is estimated by the Siamese Government at 6,000,000 for Siam proper, 3,000,000 Siamese Laos, and 1,000,000 Malays; others estimate it variously at from 6,000,000 to 8,000,000. There are besides perhaps from 1,500,000 to 2,000,000 Chinese. In lower Siam the population is clustered along the rivers and canals; in the diversified hill and plain country to the north it is distributed more generally. In character the Siamese are mild, patient, and submissive to authority. They are hospitable to strangers and to the poor; quarrels, violent crimes, and suicide are rare. But they are idle and apathetic; much time is devoted to amusements, as festivals and processions, boat-races, games, cock and dog fighting, and even combats between fish. The position of women is good, although girls can be sold as wives. The Chinese population are energetic and industrious, but very independent, and sometimes give trouble, so that their increasing numbers and organization through their secret societies are a source of anxiety. The Siamese are of medium height, well formed, with olive complexion, darker than Chinese, but fairer and handsomer than Malays, eyes well shaped, nose slightly flattened, lips a little prominent, the face wide across the cheek bones, top of forehead pointed and chin short, thus giving the face a lozenge shape, beard scanty and with hairs pulled out, hair of head coarse and black. But intermarriage during many ages with Peguans, Laos, and Cambodians (though in many cases they and their descendants keep themselves apart), as well as of slaves from the aboriginal races, has produced much variety of type. Besides the Karens, who are the remnant of a more widely extended people, and who are found on the borders of Siam and Burmah and throughout the mountains of north and west Siam, the Lawas in the same region, and the Khongs, a settled people inland from the northeastern angle of the Gulf of Siam, many other tribes of the earlier inhabitants are found occupying the whole of the forest region on both sides of the Me-kong, and known to their different neighbors by various names, all probably meaning simply "man," or "savage," as Kha, Moi, Pnom, Lolo. These eastern tribes more or less resemble each other. They are shy and timid, some having no chiefs or social organization, and these are preyed on or hunted down as slaves by their more civilized fellows in combination with the Laos. One divison of these tribes, the Kouis (the name recalls the savage "Gueos" of the Portuguese), amalgamates readily with the Laos and in some provinces forms the bulk of the population. They live by cultivating rice, by collecting honey, beeswax, and resin, or by the chase. Their women are absolutely free before marriage, but adultery is punished with death. They worship ancestral and other spirits and can hardly be called Buddhists. Yet with a few exceptions these earlier peoples are by no means inferior in appearance to the Thai or Siamese, but often the contrary; some ethnologists assign them a Caucasian origin, and identify them with the brown Polynesian race.

Slavery.

Slavery is general, but consists mainly of bondage for debt, a debtor being able to sell himself, wife, or children, or nephews or nieces,—their freedom being recoverable on payment of the debt. But the present enlightened ruler has set his face against the practice, and decreed its abolition, except in the Laos provinces and in the eastern states. The market is further recruited, first by the sale of offenders, who have the option between death and slavery, and secondly by slave-hunting raids, made in combination with the Anamites, on the villages of the wilder aborigines. These are disposed of on the spot or else to dealers from Cambodia or Siam proper.

Towns.

BANGKOK (*q.v.*) was established as the capital in 1782 after the sack of Ayuthia by the Burmese. Its population was estimated at about 300,000 in 1886. Ayuthia, now called Krung-krao, the famous capital founded in 1351 and half destroyed by the Burmese in 1767, was a generation ago the second city of the kingdom. It is still important as the entrepôt of the trade of south Laos. Many junks and fishermen come up from Bangkok. The modern town is chiefly on the water. In its most prosperous days in the 16th century it was three leagues in circumference, and contained distinct quarters for foreigners of different nationalities—Chinese, Peguans, Malays, Malabars, Japanese, and Portuguese. Prominent among its great buildings is the pyramidal structure called the Golden Mount, some 400 feet high, surmounted by a dome and spire; but most of them are now crumbling away into great broken masses of sculptured masonry, statues, and spires, half buried under the vegetation of the tropics. Chantaburi, near the Cambodian frontier, the second port of the kingdom, is noted for its shipbuilding and fisheries, and has an active export trade from the southeastern provinces. There are considerable Chinese and Burmese elements in the population, which in many of these southern towns is much mixed. Paknam, the port of Bangkok, 3 miles from the river's mouth, is fortified, as is Paklat Lang, 5 miles higher up, which is inhabited chiefly by Peguans. Various canals extend hence across the delta towards the Me-klong. Near its mouth is the town of Me-klong, peopled by Chinese merchants, fishermen, and gardeners. Higher up the river, at the foot of the hills, is Prapri, peopled by descendants of Cambodian captives. Pechaburi, a little to the south, at the foot of a range some 1500 feet high, where the king has a palace, is built after English designs; its inhabitants are Peguans. Petriu, on the east side of the Gulf of Siam, on the Kharayok river, has sugar plantations cultivated by Chinese. At Baugplasoi, at the mouth of the river, are extensive fisheries. Raheng, some 300 miles up the Me-nam, possesses docks, and there a good many teak ships are built. In the Lao or Shan country to the north Chieng-mai (Zimmé) is the most important tributary state. Its capital, Chieng-mai, the Jangomai of early European travellers, is the principal town of that region, with broad streets of good teak-built houses, surrounded with gardens, numerous pagodas, markets, and a large population. It lies in the wide fertile valley of the Me-ping, and is a great entrepôt of trade from Bangkok and southwest China (Yun-nan and Ssmao), which finds its natural outlet thence to the Bay of Bengal. The rice, timber, etc., of the districts through which this route passes are considerable. Lapong, in the same valley, and Lagong, on a neighboring tributary, are Lao towns of less importance and subordinate to Chieng-mai, as were formerly Nan and Pre, fertile teak-producing valleys to the east. Kiang-hai and Kiang-sen, farther north, on the Me-kong, were old Lao capitals of note (see SHANS), as was Luang Prabang, with its charming capital, which, like Chieng-mai, still retains some administrative independence. The extensive fertile and partly wooded plains to the north and east support great herds of cattle. With Vien-chang, a little lower down the river, Luang Prabang held its own for centuries against both Siam and Burmah. On the destruction of Vien-chang in 1828, Nangkoi, 25 miles lower down, increased in size and importance, and now has an extensive trade in English and Chinese goods. This district might perhaps without much difficulty be opened up by an easy route starting from Lak-

hon, only 130 miles distant from the sea. One of the most important provincial centres is the district of Korat, on the eastern plateau. The country is a series of fertile oases separated by tracts of waterless forest, containing good timber, and full of game. The town is fortified, and has about thirty pagodas and some well-built houses, belonging chiefly to the Chinese merchants. Cart roads converge hither with the traffic both of north Laos and of the Cambodian provinces south and east, the latter passing up the fertile Moun valley on its way to Bangkok. The whole region between the Dang-rek Mountains and the Moun river is full of splendid ruins, attesting the former Cambodian influence as far at least as 16° north, to which limit, therefore, the southward movement of the Laos may be supposed to have reached at the date of these buildings. The principal ruins of the district are found at Korat, Bassac, Phimai, and Kukhan. The character of this wonderful series of buildings, the greatest of which, those of Angkor, are on Siamese territory, have been touched on under CAMBODIA (*q.v.*), to which they properly belong; but it may be mentioned here that the earliest inscription yet found, relating to the erection of a Sivaite linga, is interpreted as belonging to 589 saka = 667 A.D., though another, undated, refers to three generations earlier. The earliest references indisputably Buddhist that have been found are three centuries later than this.

Education.

With the exception of a few schools in the capital, education is entirely in the hands of the priests, the boys going to the temples between the ages of eight or nine and thirteen. The teaching is elementary, and, by the precepts of Buddhism, must be gratuitous, the pupils repaying it by menial services in house or boat or garden, or by presents of food. At thirteen the boy enters on a novitiate, which lasts till the age of twenty-one; but, if not inclined for study, he may give it up after three or four months,—this temporary consecration symbolizing a separation from the world. At twenty-one, if so disposed, he may enter the priesthood; but there are no perpetual vows. Girls are taught, if at all, only at home, by parents or brothers. There are no educational endowments; but a certain number of persons occupy themselves with literary studies, as history, astrology, or alchemy, with which medicine is more or less combined. Medical practice, indeed, comprises a good deal of magic; but there is also considerable knowledge of medicinal herbs, and ancient medical works were written in Pali. Inoculation was long ago introduced by the Chinese, and vaccination lately by European missionaries. Women after childbirth are exposed for some time to the heat of a strong fire, the result being sometimes fatal.

Arts.

Skill is shown in the casting of large metal statues 50 feet high or more, in *repoussé* work in gold and silver, in enamelling on metals, and in gold and silver tissue work. Their drawing is spirited, but strictly conventional. The system of music is elaborate, but with no written notation. There is no harmony, but all the instruments of the orchestra play in unison, breaking off into variations and then returning to the air. They are proud of their national music, and both men and women play and sing generally. Their instruments are—a harmonicon with wooden or metal bars struck with a hammer, a two-stringed and a three-stringed violin, flutes, drums, and pipes, also the Lao "organ," the tones of which, produced by metal tongues in the pipes, are very effective.

Religion.

The Buddhism of Siam is the same as that of Ceylon, with slight doctrinal differences, much insisted on, from the Burmese. It is, however, professed in its purity by very few. The religious reform initiated by King Phra Mongkut, himself for many years a priest, has divided the people of the capital into two sects,—the reformed, known as Dhammayut, and the older or unreformed, Phra Maha Nikai. The former attach more weight to the observance of the canon than to meditation. The other sect is again divided into two parties, the one holding more to meditation, the other to the study of the scriptures. The only Brahmanical temple remaining in the country is at Bangkok, and its priests are said to be of Indian descent. Brahmans, however, are constantly employed in divination, in fixing the fortunate days for warlike expeditions, business transactions, marriages, and the like, and in arranging festivals. Buddhism is corrupted by a general worship or propitiation of nats or phees (spirits or demons); superstition in the more remote districts constitutes practically the only religion. The belief in these spirits informs and affects every department of life. There are local earth divinities to whom temples or shrines are erected. Others with human or animal form dwell in the water. Others cause children to sicken and die. Others wander and deceive as *ignes fatui*. By certain spells men can become tigers or were-wolves. Bodies of the dead are sometimes possessed, and they are carried out not by the door, but by an extemporized opening, so that they may not be able to find their way back. The numerous offerings and honors paid to these spirits lead to drunkenness and to killing of animals in sacrifice. Phallic worship prevails to a considerable extent, notwithstanding the efforts of the king to put it down. A female incarnation of deity, the Nang Tim, is found in one or two villages of east Laos. Pilgrimages are frequently made to sacred places with Indian names (all the chief towns, indeed, have an official Indian name). Many of the figures and designs employed in the ornamentation of houses are really talismans intended to avert evil. The temples, with their surrounding monastic establishments, form a conspicuous feature everywhere. Some are very extensive, covering altogether an area of 100 or 150 acres. New temples are often built, or the priests' quarters in the existing buildings repaired, by rich men desirous of "acquiring merit." The temples (*wats*) hold very little landed or house property; but, where they have been built or repaired by the king, or presented to him by some high official, they enjoy a small income chargeable on the revenues of the district, besides receiving presents from the king when he visits them in state. The priests of such temples are bound in return to give their services at state ceremonies, and their secular affairs, including repairs of temples and disciplinary matters, are administered by a special department of state. There remain now at Bangkok only two communities of nuns, who are employed in the service of the temples, and are allowed to receive voluntary offerings.

Festivals.

The numerous public festivals are partly connected with religion, but are accompanied with much rejoicing and amusement. Among them are the lunar and the fixed New-Year's Day, and the festival of agriculture, when the plough is guided by the minister, the ladies of the court following and sowing seeds, which are picked up by the people to add to their usual sowings. At the ceremony at which the king and his ministers pledge themselves, the former to administer impartial justice, the latter to be faithful and loyal in their service, the oath is taken by drinking water, and the meeting of the king and nobles, with all the attendant paraphernalia, forms a gorgeous spectacle, the day terminating with fireworks and processions of boats. On the king's state visits to the *wats* there are festive processions of boats and troops. Other festivals are at the beginning and end of the rainy season. When the floods begin to subside there is a great water procession, and the priests command the waters to retire. Even the cutting of the king's hair is made an occasion for rejoicing. In every family the cutting, at the age of twelve or thirteen, of the tuft left on the top of the head is a great ceremony; it is not practiced, except by way of imitation, among the Laos. The head is considered very sacred (this is a characteristic Papuan notion); no one must touch it, nor may it be raised above that of a superior, as in a carriage or boat. The funeral ceremonies of a prince or great man, often delayed for some months after death, are also attended by elaborate feasting, dancing, and other amusements in temporary buildings erected for the purpose. The dead, with the exception of the poor, whose bodies are given to the vultures and wild beasts, and women who die in childbirth, are usually burned within the *wats*, the ashes being preserved, or mixed with lime to plaster the sacred walls. A rich man will often bequeath a limb to the birds and beasts.

Calendar.

The Siamese month is lunar, and, as a lunar month contains 29½ days, they give the odd months 29 and the even 30. This gives a year of 354 days, and to make up the deficiency they intercalate seven or eight months in nineteen years, and add besides an occasional day to the seventh month. The years are denoted by a cycle of twelve names (of animals) taken in decades, so that every sixtieth year the year of a given name returns to the same place in the decade. The system resembles the Indian cycle of sixty years, but it is derived from China, where it dates from 2637 B.C. Two eras are in use, the Putta Sakarat or Buddhist, used in religious matters, which commences 543 B.C., and the civil era or Chula Sakarat (*i.e.*, little era), said to commemorate the establishment of Buddhism in 638 A.D. The ancient Aryan inscriptions usually employ the Saka (Salivahana) era, dating from 79 A.D.

History.

History.—The name "Siam" has been usually derived from a Malay word, *sajam*, "brown;" but this is mere conjecture. They and the Shans both call themselves Thai (Shan *Tai*), *i.e.*, "free," and the Peguans call them Shan or Shian, which seems to be a translation of "Thai" and an allied word, as are perhaps Ahom = Assam, and Sam (Assamese for Shan). The obsolete Siamese word is Siem and the Chinese Sien-lo,—the Sien being, according to them, a tribe which came from the north about 1341 and united with the Lohoh, who had previously occupied the shores of the gulf, and were prob-

ably Shans. The Siamese call the Shans *Thai-nyai*, "Great Thai," perhaps as having preceded them, and themselves *Thai-noi* or "Little Thai." They are probably therefore closely related, though this is disputed by De Rosny and others; but the inferior physique of the Siamese may be explained as due to intercourse with Malays and other southern races and to their more enervating climate. Meanwhile for many centuries before the southward move above referred to the entire south as well as southeast of the Indo-Chinese peninsula was Cambodian. The town of Lapong is said to have been founded in 575, and the half-mythical king, Phra Ruang, to have freed the Siamese from the Cambodian yoke and founded Sangkalok, on the upper waters of the Me-nam, in the following century. Buddhism is said to have been introduced in his time, but Indian influences had penetrated the country both from the north and from the south long before this. Other Lao towns were built about the 7th century, and during the following centuries this branch of the race gradually advanced southwards, driving the Karens, Lawas, and other tribes into the hills, and encroaching on what had hitherto been Cambodian territory. Their southward progress may indeed almost be traced by their successive capitals, several of which are clustered on the Me-nam within a short distance of each other, viz., Phitsalok, Sukkothai, and Sangkalok on the eastern branch, Nakhon Savan at the junction, and Kamphong-pet, the immediate precursor of Ayuthia, on the western branch. A Sukkothai inscription of about 1284 states that the dominions of King Rama Kamheng extended across the country from the Me-kong to Pechaburi, and thence down the Gulf of Siam to Ligor; and the Malay annals say that the Siamese had penetrated to the extremity of the peninsula before the first Malay colony from Menangkabu founded Singapore, *i.e.*, about 1160. The ancestors of the Siamese were then on the western branch of the Me-nam, and in 1351, under the famous Phaya Uthong (afterwards styled Phra Rama Thibodi, and probably of a Shan family) moved down from Kamphong-pet, where they had been for five generations, to Chaliang; and, being driven thence, it is said, by a pestilence, they established themselves at Ayuthia. This king's sway extended to Moulmain, Tavoy, Tenasserim, and the whole Malacca peninsula (where among the traders from the West Siam was known as Sornau, *i.e.*, Shahr-i-nau or Newtown, probably in allusion to Ayuthia,—Yule's *Marco Polo*, ii. 260), and was felt even in Java. This is corroborated by Javan records, which described a "Cambodian" invasion about 1340; but Cambodia was itself invaded about this time by the Siamese, who took Angkor and held it for a time, carrying off 90,000 captives. The great southward expansion here recorded, whether of one or of two allied Thai tribes, confirms in a remarkable way the Chinese statement above mentioned, and was probably a consequence or a part of the great contemporaneous activity of the more northern Shan kingdom of Mau. The wars with Cambodia continued with varying success for some 400 years, but Cambodia gradually lost ground and was finally shorn of several provinces, her sovereign falling entirely under Siamese influence. This, however, latterly became displeasing to the French, now in Cochin China, and Siam has been obliged to recognize the protectorate forced on Cambodia by that power. Vigorous attacks were also made during this period on the Lao states to the northwest and northeast, followed by vast deportation of the people, and Siamese supremacy was pretty firmly established in Chiengmai and its dependencies by the end of the 18th century, and over the great eastern capitals, Luang Prabang and Vien-chang, about 1828. During the 15th and 16th centuries Siam was frequently invaded by the Burmese and Peguans, who, attracted probably by the great wealth of Ayuthia, besieged it more than once without success, the defenders being aided by Portuguese mercenaries, till about 1555, when the city was taken and Siam reduced to dependence. From this condition, however, it was raised a few years later by the great conqueror and national hero Phra Naret, who after subduing Laos and Cambodia invaded Pegu, which was utterly overthrown in the next century by his successors. But after the civil wars of the 18th century the Burmese, having previously taken Chiengmai, which appealed to Siam for help, entered Tenasserim and took Mergui and Tavoy in 1764, and then advancing simultaneously from the north and the west captured and destroyed Ayuthia after a two years' siege (1767).

The intercourse between France and Siam began about 1580 under Phra Narain, who by the advice of his minister, the Cephalonian adventurer Constantine Phaulcon, sent an embassy to Louis XIV. When the return mission arrived, the eagerness of the ambassador for the king's conversion to Christianity, added to the intrigues of Phaulcon with the Jesuits with the supposed intention of establishing a French supremacy, led to the death of Phaulcon, the persecution of the Christians, and the cessation of all intercourse with France. An interesting episode was the active intercourse, chiefly commercial, between the Siamese and Japanese Governments from 1592 to 1632. Many Japanese settled in Siam, where they were much employed. They were dreaded as soldiers, and as individuals commanded a position resembling that of Europeans in most Eastern countries. The jealousy of their increasing influence at last led to a massacre, and to the expulsion or absorption of the survivors. Japan was soon after this, in 1636, closed to foreigners; but trade with Siam was carried on at all events down to 1745 through Dutch and Chinese and occasional English traders. In 1752 an embassy came from Ceylon, desiring to renew the ancient friendship and to discuss religious matters. During recent agitations of the Buddhist priests against Christianity in Ceylon they received much active sympathy from Siam. After the fall of Ayuthia a great general, Phaya Takh Sin, collected the remains of the army and restored the fortunes of the kingdom, establishing his capital at Bangkok; but, becoming insane, he was put to death, and was succeeded by another successful general, Phaya Chakkri, who founded the present dynasty. Under him Tenasserim was invaded and Tavoy held for the last time by the Siamese in 1792, though in 1825, taking advantage of the Burmese difficulty with England, they bombarded some of the towns on that coast. The supremacy of China is indicated by occasional missions sent, as on the founding of a new dynasty, to Peking, to bring back a seal and calendar. But the Siamese now repudiate this supremacy, and have sent neither mission nor tribute for thirty years, and yet their trading vessels are admitted to the Chinese free ports, like those of any other friendly power. The late sovereign Phra Paramendr Maha Mongkut, was a very accomplished man, an enlightened reformer, and devoted to science; his death indeed was caused by fatigue and exposure while observing an eclipse. Many of his predecessors, too, were men of different fibre from the ordinary Oriental sovereign. Chao Dua, the adversary of Phaulcon, went about seeking pugilistic encounters. He is reported to have been a cruel tyrant and debauchee and a keen sportsman; but the offence given to his subjects in the latter character and the evil reports of the persecuted French missionaries may have unduly blackened his reputation.

Of European nations the Portuguese first established intercourse with Siam. This was in 1511, after the conquest of Malacca by D'Albuquerque, and the intimacy lasted over a century, the tradition of their greatness having hardly yet died out. They were supplanted gradually in the 17th century by the Dutch, whose intercourse also lasted for a similar period; but they have left no traces of their presence as the Portuguese always did in these countries to a greater extent than any other people. English traders were in Siam very early in the 17th century; there was a friendly interchange of letters between James I. and the king of Siam, who had some Englishmen in his service, and, when the ships visited "Sia" (which was "as great a city as London") or the queen of Patani, they were hospitably received and accorded privileges,—the important items of export being, as now, tin, varnish, deerskins, and "precious drugs." Later on the East India Company's servants, jealous at the employment of Englishmen not in their service, attacked the Siamese, which led to a massacre of the English at Merqui in 1687; and the factory at Ayuthia was abandoned in 1688. A similar attack is said to have been made in 1719 by the governor of Madras. After this the trade was neglected. Penang, a dependency of Quedah, was occupied in 1786, and in the 19th century the stagnation of trade led to the missions of Crawford (1822), Burney (1826), and Sir J. Brooke (1850); but they were not very cordially received, and effected little. Sir J. Bowring's treaty in 1856, however, put matters on a different footing, and Europeans can now reside in Siam, buy or rent houses, and lease land. The export and import duties are also fixed, and there is a vice-consular court at Chiengmai, with appeal to the consular court at Bangkok, held from time to time by a judge from Singapore, with which place there are extradition arrangements. Of late years the northeastern provinces have been harassed by invasions of the Lu and Ho, people of Chinese extraction, their incursions extending down the Me-kong as far as Nong-kai.

Besides works referred to at the end of article SHANS, the chief authorities are La Loubère, *Description du Royaume de Siam*, 1714 (the best of the old writers); Pallegoix, *Royaume Thai ou Siam*, Paris, 1854; Crawford, *Embassy to Siam*; Bowring, *The Kingdom and People of Siam*, London, 1857; Bastian, *Die Völker des östlichen Asiens*, vols. i., iii., Leipsic, 1867; Garnier, *Voyage d'Exploration en Indo-Chine*, Paris, 1873; Mouhot, *Travels in Indo-China, etc.*; *Journ. of Ind. Archip.*, vols. i., v.; Gréhan, *Le Royaume de Siam*, Paris, 1870; Réclus, *Nouvelle Géographie Universelle*, vol. viii.; Bagge, *Re-*

port on the Settlement of the Boundary between Siam and British Burmah, 1868; Satow; *Notes of the Intercourse between Japan and Siam in the 17th Century*; Aymonnier, in *Excursions et Reconnaissances*, Nos. 20–22 (Saigon); *Consular Reports*, 1884–85. (C. T.)

Language and Literature.

Language.

The Siamese language is spoken over the whole of Siam proper. In the Malay peninsula the boundary-line comes down on the west coast nearly as far as Quedah and Perlis, and includes also Junk Ceylon, while on the east coast the population is mainly Siamese as far as Ligor inclusive, and also in Singora Siamese appears to be the ruling language. Its boundary towards Burmah, the Shan and Laos states, and Anam and Cambodia cannot be defined so precisely. There are also in the northeast a number of wild tribes who speak languages of their own. The name by which the Siamese themselves call their language is *phásá thai*, or "language of the freemen;" and it probably dates from the period when the Siamese made themselves independent of Cambodian rule in the 12th century. The Shan tribes, whose language (with those of the Ahom, Khamti, and Laos) is closely akin to Siamese, also use the term *tai* (only with the unaspirated *t*) for their race and language.

Both in Shan and Siamese the system of tones, which is one of the main features of all the languages of Indo-China, has attained its greatest development. But while in Shan the tones are not marked in the written language, in Siamese there are distinct signs to denote at least four of the five simple tones (the even tone not being marked), and there is further a classification of the consonants into three groups, in each of which certain tones predominate. It is always the initial consonant of a word that indicates, either by its phonetic power or by the tonic accent superadded or by a combination of the two, the tone in which the word is to be uttered, so that, *e.g.*, a word beginning with a letter of the second class in which the even tone is inherent, and which has the mark of the ascending tone over it, is to be pronounced with the descending tone.[1] The difficulties caused to a European student of the spoken language by the tones are increased by the greatly expanded vowel-system. In addition to the short and long, there are shortest vowels, sets of open and close vowels, etc., and a large number of vowel combinations. Owing to the introduction of the Indian consonantal system and the incorporation in it of many letters to express certain sounds peculiar to Siamese, the number of consonants has been swelled to forty-three; but, while many of these are only used in words adopted from the Sanskrit and Pali, Siamese utterance knows no more than twenty; *kh*, *g*, *gh* are all pronounced as *kh*; similarly *ph*, *b*, *bh* as *ph*, etc.,—the language having a predilection for hard letters, especially aspirates. The only compound letters at the beginning of words are combinations of hard letters with *l*, *r*, *w*, *y*, while the finals are confined in pronunciation to *k*, *t*, *p*, *ń* (ng), *n*, *m*. This causes a considerable discrepancy between the spelling of words (especially loan words) and their pronunciation. Thus *sampúrn* is pronounced *sombun*, *bhásh*á—*phásá*, *nágara*—*nakhon*, *saddharma*—*satham*, *kuśala*—*kuson*, *śesha*—*set*, *vára*—*van*, *Magadha*—*Makhot*. The foreign ingredients in Siamese are principally Sanskrit, mostly in a corrupted form. The importation of Pali words dates from about the 12th century, when, the country having shaken off the yoke of Cambodia, a religious intercourse was established between Siam and Ceylon. Besides these, there are some Khmêr (Cambodian) and Malay words.[2] Exclusive of those foreign importations, Siamese is a monosyllabic language in which neither the form nor the accent or tone of a word determines the part of speech to which it belongs. Homonymous words abound and are only distinguished from one another by the tones. Compare *lan*, "white"; *làn*, "to relate"; *lan*, "to flatter"; *lân*, "to smooth"; *lăn*, "relation." Words are unchangeable and incapable of inflection. The Siamese are fond of joining two words the second of which is either purely synonymous to or modifies the sense of the first, or is only a jingling addition. There is no article, and no distinction of gender, number, or case. These, if it is at all necessary to denote them, are expressed by explanatory words after the respective nouns; only the dative and ablative are denoted by subsidiary words, which precede the nouns, the nominative being marked by its position before, the objective by its position after, the verb, and the genitive (and also the adjective) by its place after the noun it qualifies. Occasionally, however, auxiliary nouns serve that purpose. Words like "mother," "son," "water" are often employed in forming compounds to express ideas for which the Siamese have no single words; *e.g.*, *lúk cân*, "the son of hire," a laborer; *mé mü*, "the mother of the hand," the thumb. The use of class words with numerals obtains in Siamese as it does in Chinese, Burmese, Anamese, Malay, and many other Eastern languages. As in these, so in Siamese the personal pronouns are mostly represented by nouns expressive of the various shades of superior or lower rank according to Eastern etiquette. The verb is, like the noun, perfectly colorless,—person, number, tense, and mood being indicated by auxiliary words only when they cannot be inferred from the context. Such auxiliary words are *yû*, "to be," "to dwell" (present); *dai*, "to have," *lêw*, "end" (past); *cá*, "also" (future); the first and third follow, the second and fourth precede, the verb *Hài*, "to give" (prefixed), often indicates the subjunctive. As there are compound nouns, so there are compound verbs; thus, *e. g.*, *pai*, "to go," is joined to a transitive verb to convert it into an intransitive or neuter; and *thúk*, "to touch," and *tòng*, "to be obliged," serve to form a sort of passive voice.[3] The number of adverbs, single and compound, is very large. The prepositions mostly consist of nouns. The order of the words in a single sentence is subject, verb, object. All attributes (adjectives, genitive, adverbs) follow the word to which they are subordinated. The following simple sentence may serve as an example of Siamese construction and diction; *mûa* (time) *ân* (read) *nan-sü* (book) *ní* (this); *lêo* (end, done (*coń* (should) *fâk-vai* (entrust) *kí* (to) *phüenbàn* (neighbors) *hai* (give cause) *khan* (they) *ân* (read), *i. e.*, "when you have read this book, please give it to your neighbors that they may read it."

The current Siamese characters are derived from the more monumental Cambodian alphabet, which again owes its origin to the alphabet of the inscriptions, an offshoot of the character found on the stone monuments of Southern India in the 6th and 8th centuries. The sacred books of Siam are still written in the Cambodian character, and some have occasionally an interlinear translation in the current Siamese hand.

The study of the Siamese language was initiated in Europe by La Loubère (1687), from whom Dr. J. Leyden (the Languages and Literature of the Indo-Chinese Nations," in *Asiatic Researches*, vol. x. pp. 158–289, reprinted in *Miscellaneous Papers on Indo-China*, vol. i, 1886, pp (84–171) has derived much of his information. Leyden's *Comparative Vocabulary of the Barma, Malayu, and Thai Languages* appeared in 1810. The first grammar of the language we owe to James Low, Calcutta, 1828. Very useful *Grammatical Notices of the Siamese Language*, by the Rev. J. Taylor Jones, appeared at Bangkok in 1842. The *Grammatica Linguæ Thai* of J. B. Pallegoix, Bangkok, 1850, was followed in 1854 by his great *Dictionarium* in Siamese, Latin, French, and English. An analytical account of the language was attempted by Ad. Bastian in his *Sprachvergleichende Studien*, 1870, pp. 191–226. In 1881 L. Ewald brought out at Leipsic his *Grammatik der Tai-oder Siamesischen Sprache*. Lastly, Prof. Fr. Müller gave a summary of Siamese grammar in his *Grundriss der Sprachwissenschaft*, vol. ii. part 2; Vienna, 1882, pp. 367–376. A new grammar, by the Rev. S. George, is in progress. Compare also W. Schott, *Ueber die indochinesischen Sprachen, insonderheit das Siamesische*, 1856; and E. Kuhn, *Ueber Herkunft und Sprache der transgangetischen Völker*, 1883. An English grammar written in Siamese, and designed for use in schools, appeared at Bangkok in 1837.

Literature.

There are no records in Siamese referring to the time antecedent to the settlement of the nation in their present locality, or, in the words of Mr. Ney Elias, "of earlier date than the founding of their first national capital, Ayuthia, at the commencement of the 14th century."[4] The inscription at Sukkothai, said to be of the year 671 of the Siamese era, nine years after the invention of the present Siamese characters,[5] cannot be put in evidence as an historical record till a facsimile and revised translation shall have been obtained. The few manuscript annals mentioned by Bishop Pallegoix have not yet been critically examined; but metrical compositions, containing legendary tales and romances, abound and are eagerly studied. The subjects are mostly taken from the Indian epics, as in the case of the *Rámá-kiun* or Rámáyana, more rarely from Malay or Javanese legend, such as the drama *I-hnao*. There is a great variety of metres, all of which have been described with much minuteness of detail by Colonel Low in his article on Siamese literature, in *Asiatic Researches*, vol. xx. pp. 351–373.[6] In their romantic poetry the Siamese have a greater tendency to describe than to relate; their pictures of places and scenery are grand and striking and form the best part of their poetical conceptions. The great blemish of their poetry consists in tedious embellishments and a hankering after

indecent and often gross allusions, from which but few works, such as *Sang Sin Chai*, and *Samut Niyai Si Muang*, may be said to be free. The titles of the principal romances are *Hoi Sang*, *Nang Pratham*, *Sang Sin Chai*, *Thepha Lin Thong*, *Suwanna Hong*, *Thao Sawatthi Racha*, *Phra Unarut*, *Dara Suriwong*, *Khun Phan*, *Nong Sip Song*, and the dramas *I-nao* and *Phra Simuang*. The plots of some of these have been given by Colonel Low. The most popular of the religious books, all of which are translations or amplifications from Pali originals, is called *Somanakhodom* (Çramana Gautama), which is identical with the *Wessantara Jâtaka*. In miscellaneous literature may be mentioned *Saphâsit*, consisting of 222 elegant sayings in the accented metre called Klong, and *Wuta Chindamani* (Vritta Chintâmani), a work on prosody like the Pali *Vuttodaya*, but treating also of a number of grammatical questions. The fable literature is of course largely represented; the lists, however, are frequently swelled by the enumeration of single fables which are but parts of larger collections.

The number of works on law is considerable; and it is remarkable that, while in Burmah many Pali codes have currency, not a single Pali text-book on law should have been discovered in Siam; all that we meet with in the law books are a few Pali quotations here and there. *Laksana Phra Thammasat Laksana Phun Mia*, an introduction to the code of Siamese laws, founded on the Dharmaçâstra and on royal edicts, was completed in 1804. It contains thirty books, at the head of which stands the *Phra Thammasat*, attributed to Manosâra or Manu, a treatise on the classification of laws. Next comes the *Inthaphat*, or book of Indra, a guide or exhortation to councillors and judges, and then the *Phra Thamnun*, or rules for the general conduct of judicial business. Then follow in order the undermentioned sections—disputes, plaints and allegations, official rank, classification of people, debt, marriage, criminal law, abduction, slavery, disputes connected with land, evidence, inheritance, examining officers, appeal, disputes as to classification of people, radius of responsibility for burglaries, etc., the thirty-six laws, the royal edicts, trial by ordeal of water and fire, laws of the palace, laws of the priesthood, offences against the king, offences against the people, rebellion, ancient statutes, recent statutes. Only one of these sections, the one on slavery, has been translated into English, by Dr. Bradley; it appeared in the *Bangkok Calendar*. The whole work has been printed at Bangkok in two volumes. The *Kathu Phra Aiyakan*, another compendium of laws, contains edicts principally referring to assaults, adultery, and the appraisement of fines. Among these we find the following: "A man who strikes another with a blank book shall be fined as though he had struck him with his hand; but if the assault is committed with a book of the classics the offender shall be fined twice as much as he would have had to pay for assaulting with a stick." The *Laksana Tat Fong*, or law of plaints and allegations, and of the institution and summary dismissal of suits, appears to be identical with the fifth section of the printed code. There is also a separate work called *Phra Thamnun*, which, though identical in name with the section of the *Laksana Phra Thammasat* above described, covers much more ground. A compendium of law entitled *Rüang Kot Mai Müang Thai*, or Code of Laws of the Kingdom of Siam, in two volumes, was printed at Bangkok in 1879. Colonel Low, who did not touch on jurisprudence in his essay on Siamese literature, made good the omission in a separate article "On the Laws of Siam," in the first volume of Logan's *Journal of the Indian Archipelago* (Singapore, 1847).

Pallegoix, in his "Catalogus præcipuorum librorum linguæ Thai" (*Grammatica*, pp. 172-180), gives the titles of a good many treatises on scientific subjects, medicine, mathematics, astrology; but none appear to have been critically examined. In the first volume of his *Description du royaume Thai* (1854) are inserted various pieces translated from Siamese works. See also on the Siamese language and literature generally the "Remarks" by the Rev. C. Gützlaff, in the *Transactions of the Royal Asiatic Society*, vol. iii. (1835), pp. 291-304; and on the literature Leyden's "Essay" above referred to (*Miscellaneous Papers*, vol. i. pp. 143-147). It is only in quite recent times that an Anamese influence has begun to be traceable in the language and literature of the Siamese.

In 1810 Dr. Leyden undertook, at the instance of the Calcutta Auxiliary Bible Society, to superintend a translation of the four Gospels into Siamese; but he died before the project was carried into effect. Subsequently Messrs. Gützlaff and Tomlin, assisted by learned natives, labored till 1833 at a trustworthy translation of the New Testament into Siamese. Their task was continued and completed by Messrs. Jones and Robinson, and the work was published in 1846. (R. R.)

End of Volume Twenty-first.

APPENDIX.

ROUSSEAU, LOVELL HARRISON (1818–1869).—A conspicuous lawyer in criminal cases and a distinguished soldier, General Rousseau was a native of Lincoln County, Kentucky, being of Huguenot descent. His childhood was destitute of school advantages, but at twenty-three years of age he had won admission to the Indiana bar, and three years later became a member of the legislature of that State, serving successively in each branch. In the war with Mexico he led a company of Indiana volunteers and served with distinction at the battle of Buena Vista. Settling at Louisville in 1849 the outbreak of the civil war found him a member of the Kentucky Senate, resisting efforts to unite that State with the Confederacy. He raised two regiments of Kentucky volunteers which he was obliged to encamp in Indiana on account of the opposition of the authorities in the former State. In October 1861 he was commissioned a brigadier-general, while for gallantry in action at Perryville he was made a major-general. At Shiloh, Stone River, Chattanooga and Chickamauga his troops rendered eminent services. He had command of the military district of Tennessee at the close of the war, sat in the Thirty-ninth Congress as a supporter of President Johnson's reconstruction policy, was commissioned Brigadier general in the regular army in 1867 and the following year was assigned to the command of the department of Louisiana, where he died 8th Jan. 1869 at New Orleans.

RUMSEY, JAMES (*c.* 1743–1792), an American inventor, was born at Bohemia Manor, Cecil county, Maryland, 1743. In September 1784 he exhibited on the Potomac a boat which worked against the stream. After John Fitch had asked public support for his project of steam navigation Rumsey began to experiment in the same direction. In March 1786 he used a steam-engine to propel a boat by pumping in water at the bow and expelling it at the stern. In the summer of that year Fitch exhibited a steamboat on the Delaware and in March 1787 obtained a monopoly of steam navigation in Pennsylvania waters. He afterwards obtained special privileges from the States of Delaware and New York. Rumsey now claimed priority of invention and pamphlets were issued on both sides. A Rumsey Society was formed at Philadelphia in 1788 and another in England whither Rumsey had gone to obtain patents and to perfect his invention. He made a successful trip on the Thames but a few days after died in London, 23 December, 1792.

RUSH, JAMES (1786–1869). For this son of Dr. Benjamin Rush the Philadelphia Library Company is trustee of $1,000,000 with which he endowed its Ridgway Branch—a name which perpetuates the memory of his wife's family through whom he obtained his wealth. He was graduated at Princeton College, studied medicine with his father and in Edinburgh and wrote a book on the *Philosophy of the Human Voice* (1827) which had a wide reputation as a scientific discussion of elocution. A dramatic prelude entitled *Hamlet* (1834), an *Analysis of the Human Intellect* (1865) which propounded a physiological theory of mental action, and a satirical dialogue called *Rhymes of Contrast on Wisdom and Folly* (1869) comprise his publications. He bequeathed his copyrights to the Library Company with instructions to reprint his books every ten years for half a century in sufficient quantities "to supply any demand which may be made for any or either of them at a price not exceeding the cost of publication." The Ridgway Library is a fine fire-proof edifice built of granite in Doric style, and stands on the Broad Street side of an enclosed square in the southern part of the city. It cost about $800,000.

His uncle Jacob (1746–1820) was for years a county judge in Philadelphia, and a controversialist upon religious subjects in contemporary periodicals. He left a daughter Rebecca who was the authoress of a novel called *Kelroy* (1812).

RICHARD RUSH (1780–1859). This accomplished diplomatist, the son of Dr. Benjamin and the brother of Dr. James Rush, was born in Philadelphia on the 29th August, 1780. From the college at Princeton he went to the study of law and rapidly attained an eminent position at the Philadelphia bar. After serving his State as Attorney-General and Comptroller of its Treasury (1811) President Madison summoned him into his cabinet as Attorney-General from 1814 to 1817, in the latter part of which term Rush temporarily discharged the duties of Secretary of State. On Monroe's accession to the presidency a political intimacy began between his chief of cabinet, John Quincy Adams, and Rush, which endured as long as the former held administrative place in the government. Adams maintained his friend for eight years as minister to the Court of Great Britain, and on becoming president himself placed him at the head of the Treasury department. In 1828 the ticket which bore the names of Adams for president and Rush for vice-president was defeated at the general election. Through Rush as Commissioner the United States obtained from the English courts James Smithson's legacy of over $500,000 in 1838. He was also minister to the court of Louis Philippe (1847) and officially recognized the success of the French revolution of the following year. His observations while in France, edited by his executors and published in a volume entitled *Occasional Productions, Political, Diplomatic, and Miscellaneous* (1860), are of permanent historical value. The fishery-treaty of 1818 with Great Britain, whereby the United States perpetually relinquished the greater part of their ancient rights to take fish in the gulfs and bays of British America, was negotiated by Richard Rush in London. As a literary worker besides occasional pamphlets and papers he supervised while Attorney-General of the United States a codification of the national statutes (5 vols., 1815. *A Narrative of a Residence at the Court of London* (1833), *Memoranda* of same residence (1845), *Washington in Domestic Life* (1857) and the *Occasional Productions* already mentioned constitute the extant publications from his pen. He died on 30th July 1859 at the Sydenham estate near Philadelphia inherited from his father. Of three sons who survived him, Benjamin wrote vigorous protests against the

policy of the Southern States in their attempted secession from the Union.

RUSK, THOMAS JEFFERSON (1802–1856), an American senator, was born in South Carolina in 1802. He began the practice of law in Georgia but in 1835 went to Texas to join in the struggle against Mexico. He was a member of the convention which declared Texas independent in March 1836 and was made secretary of war in the provisional government. At the battle of San Jacinto he commanded the Texan army after General Houston was wounded. Under the constitutional government of Texas formed in October 1836 he became secretary of war, and afterwards chief-justice of the Supreme Court but resigned in 1842. He was president of the convention which consummated the annexation of Texas to the United States in 1845, when he was elected to the United States Senate, a position which he held until his death at Nacogdoches, Texas, July 29, 1856.

RUTLEDGE, EDWARD (1749–1800), an American statesman, son of Dr. John Rutledge who had come from Ireland about 1735, was born at Charleston South Carolina, 23 November 1749. He studied law with his brother John and afterwards at the Temple in London, whence he returned in 1773 and in the next year was a delegate to the first Continental Congress. He was a member of successive Congresses until 1777, signed the Declaration of Independence, and served on the first Board of War. In 1779 he was captain of a company of artillery and dislodged the British troops from Port Royal Island. In 1780 he was taken prisoner at the capture of Charleston and detained at St. Augustine for nearly a year. After the war he resumed the practice of his profession and served in the State legislature. He drafted the act to abolish the right of primogeniture and exerted himself in favor of the ratification of the Federal Constitution. In 1798 he was elected governor of the State and died in office at Charleston January 23, 1800.

His elder brother HUGH RUTLEDGE (*c.* 1740–1811) was in 1776 judge of the South Carolina Court of Admiralty, in 1777 speaker of the legislative council, in 1780 was prisoner of war with his brother at St. Augustine, in 1782–5 was speaker of the House of Representatives, and from 1791 till his death in January 1811 was chancellor of South Carolina.

FRANCIS HUGER RUTLEDGE (1799–1866), son of Hugh, graduated at Yale College in 1821, was ordained priest in the Protestant Episcopal Church in 1825, settled in Florida in which State from 1851 to 1866 he was the first bishop of his church.

JOHN RUTLEDGE (1739–1800), an American jurist, brother of Edward, was born in Charleston South Carolina in 1739. His legal education was gained in London and on his return in 1761 he became conspicuous for his ability. Having taken part, as chairman of the committee to appeal to the House of Lords in the Stamp-tax Congress held in New York in 1765 of which he was the youngest member, he acquired national fame, and later he was twice sent to the Continental Congress (1774–75), where in the words of Patrick Henry he was "by far the greatest orator." He became first president of South Carolina under the Constitution of 1776 which he assisted in drafting, resisted the British assault on Fort Moultrie and was governor of his native State in 1779 from which he was driven by the capture of Charleston. In these troublous times the State legislature clothed him and his council with the dictatorial power "to do everything that appeared necessary for the public good," and during the disastrous campaign of Gen. Gates and the more successful operations of Gen. Greene in the South the political freedom of South Carolina was bound up with his administration. He became chancellor of the State in 1784, assisted in framing the United States Constitution, was appointed to the bench of the United States Supreme Court in 1789 and named chief-justice of the same court by Washington in 1795 to succeed John Jay. Although he had acted with the Federalists he denounced the Jay treaty and so incurred the displeasure of his party. He opened the August term of the Supreme Court and set out upon his circuit in November, but when his nomination came before the Senate for confirmation it was known that Mr. Rutledge's mind had become impaired and confirmation was refused. This action "extinguished the last spark of sanity." He died at Charleston 23d July, 1800.

SABINE, LORENZO (1803–1877), an American antiquary, was born at Lisbon New Hampshire, 28 February, 1803. Dependent on his own exertions from an early age he thrice won a seat in the Maine legislature, was appointed a collector of customs and after two years' residence represented Boston in the thirty-first Congress. Though self-educated he obtained the honorary degree of A.M. from Bowdoin and Harvard Colleges. Besides contributions to the *North American Review* he wrote the *Life of Commodore Edward Preble* (1847) for Sparks's *American Biography* and made an able *Report on the American Fisheries* (1853). He is best known by his biographical work *The American Loyalists* (1847; 2d ed., 2 vols. 1864) and his *Notes on Duels and Duelling* (1855).

ST. CLAIR, ARTHUR (1734–1818), an American general of ennobled lineage, was a native of Thurso in Scotland. After passing the course at the University of Edinburgh he studied medicine with the celebrated Dr. John Hunter in London. On the death of his mother St. Clair came into a comfortable inheritance, and purchased an ensign's commission in the Royal American Regiment of Foot 13 May, 1757. Joining his regiment he served the next year at Louisburg under General Amherst and at Quebec under Wolfe. He married Phœbe Bayard, a wealthy lady of Huguenot descent, in Boston two years later and in 1762 settled with her in Ligonier Valley, Pennsylvania, on a tract of 700 acres partly a grant for his military services. Here among a number of Scotch settlers he surveyed lands, erected mills, exercised civil and judicial functions and with a colonel's rank led the local militia. In 1775 the Continental Congress sent him as secretary with a commission to treat with the Indians at Fort Pitt, and at this time he proposed a plan for the capture of Detroit which Congress, expecting a favorable issue of Arnold's expedition against Quebec, neglected. Early in the following year he raised and led a Pennsylvania regiment to Canada arriving in time to cover Arnold's retreat. After the disaster to the American arms at Three Rivers he aided General Sullivan's retreat to Crown Point and thence to Fort Ticonderoga. He now received from Congress a commission as brigadier-general and was detailed to organize the New Jersey militia, and while on this duty by forwarding troops and imparting information materially assisted Washington's successful operations at Trenton. These services led to his joining Washington's staff as adjutant and to his promotion to be a major-general. Congress ordered him on the 31st of March 1777 to Ticonderoga, where he soon passed under General Schuyler's command. Burgoyne was approaching with an army from the north and New England with exaggerated notions of its importance hoped to see him turned back at this fortress. The defensive works required a garrison of 10,000 men and were commanded by Mount Defiance which Major Trumbull had previously shown to be accessible, but which had been left unfortified and unoccupied by the Americans. St. Clair occupied the works with 3300 poorly equipped troops and awaited the enemy's advance. On the 4th of July a British battery frowned from the summit of Mount Defiance and a council of war within the fort determined on the evacuation of the untenable defences. The retreat was sharply pursued by the British and St. Clair reached Fort Edward a week later with less than half his original garrison. But this remnant became the nucleus of the army

which was soon to witness at Saratoga the glorious change of fortunes which their commander had predicted as the consequence of their falling back to new lines. Neither St. Clair nor Schuyler escaped the censures of the disappointed at the loss of Ticonderoga, and the former was suspended from command but found a place with Washington whom he served as an aide at the battle of Brandywine creek. In 1778 Congress after investigation exonerated both the northern commanders. Restored to active service St. Clair joined General Sullivan's expedition against the Six Nations of Indians; he was a member of the court-martial which tried Major Andre; he succeeded Benedict Arnold in the command of West Point; and he participated in the operations at Yorktown which terminated in the surrender of Lord Cornwallis.

The close of the war found General St. Clair's fortunes wrecked by the destruction of his property. In 1785 he entered the Continental Congress and the next year presided over that body. On the erection of the Northwest Territory in 1788 St. Clair was appointed the first governor and its capital was fixed in 1790 at a point on the Ohio River which received its name from the Society of Cincinnati, an association of revolutionary army officers, of the Pennsylvania branch of which St. Clair had been president from 1783 to 1789. From the office of governor, on account of his strong federalism, he was displaced in 1802 by President Jefferson.

St. Clair's operations among the Indians of the frontier were unfortunate. He secured a treaty from them at Fort Harmer in 1789, but the following year they broke out into hostilities and defeated General Harmer who had been sent against them. Congress now devolved the command of its armies upon St. Clair who recruited a new column and, after building and garrisoning Forts Hamilton and Jefferson in the hostile territory, marched northward. Crippled with gout St. Clair was borne forward in a litter. While encamped on a tributary of the Wabash in Darke county Ohio his troops were surprised by the Indians on the 4th of November 1790 and were disastrously defeated. The Indians are said to have been directed by the famous half-breed Captain Joseph Brandt. Although St. Clair was exonerated by Congress from blame on account of this misfortune he resigned his army commission, and when he was deprived of his gubernatorial position he retired to Chestnut Ridge, near Greensburg Pennsylvania, in view of his former estate. His remaining days were passed in poverty and his claims upon the Federal government were left unadjusted, but in 1813 Pennsylvania gave him an annuity of $400, while a small pension from the general Government went to satisfy his creditors. He died on the 31st of August, 1818. His papers, recently brought to light, were purchased, edited and published by order of the Ohio legislature under the title *The St. Clair Papers: Life and Correspondence of Arthur St. Clair, with his Correspondence and other Papers.* By W. H. Smith (Cincinnati, 1882). J. P. L.

SALTONSTALL, a prominent family in the history of New England, of which the most eminent were:

Sir Richard (1586–1658) the ancestor of the American branch of that name was born at Halifax, England, and became a liberal Puritan. Coming to Massachusetts with Governor Winthrop in 1630, he resided at Charlestown and Watertown, but returned to England in 1631 where he befriended the Massachusetts Bay colony and became one of the patentees of Connecticut.

Gurdon Saltonstall (1666–1724) great-grandson of the preceding was born at Haverhill Massachusetts, 27 March, 1666. He graduated at Harvard College in 1684 and was ordained pastor at New London Connecticut in 1691. His administrative abilities secured his selection as Governor of Connecticut in 1707 to which office he was annually re-elected until his death on September 20, 1724. During his administration the first printing-press in Connecticut was established at New London, and Yale College which he generously patronized was removed in 1716 from Saybrook to New Haven. He also assisted the colonial efforts to capture Canada 1709–13 and employed agents in England to defend the original charter of Connecticut.

Leverett Saltonstall (1783–1845), grandson of Governor Saltonstall's brother Richard (1703–56) an eminent judge of the superior court of Massachusetts, was born at Haverhill June 13, 1783. He graduated at Harvard College in 1802, began the practice of law at Salem in 1805, was State senator in 1831, mayor of Salem in 1836 and member of congress 1838–43. He wrote a *Historical Sketch of Haverhill.* Died at Salem 8 May, 1845, having enriched the libraries of Phillips Academy and Harvard College by bequests.

SALVATION ARMY. In July 1865 William Booth, impressed with the religious indifference prevailing amongst the masses of East London, determined to do all he could to bridge the chasm between them and the existing church organizations, believing that an atonement had been made sufficient for every sinner and that by true repentance and faith in the Lord Jesus Christ the very worst might enter upon a new life. Requiring not merely an assent of the mind to a statement of certain truths but thorough submission of heart and an abandonment of all known evil he soon had around him numbers of earnest workers whose whole purpose and delight were to make men listen at least to the claims God had upon their time and service. On being asked where he expected to get ministers who would be willing to work without stipend he pointed to a glittering gin palace and said, "Out of there."

For the first eleven years this band of men and women were known as the "Christian Mission" and worked in a way similar to the Primitive Methodists, having yearly conferences of delegates. In that period of time many were converted, but this method did not satisfy the minds of the more aggressive members of the mission and it was determined to adopt military tactics—seeing that the best minds of the world had been engaged in perfecting that system—and to use them in a spiritual way.

The movement reached America in 1880. Mr. Railton and six young girls called "Hallelujah Lasses" were the first to land here unfurling their colors at Castle Garden. Their first meeting was held on the following Sabbath in the notorious Harry Hill's variety resort on Crosby Street in New York City and they startled Hill when they refused to take any of his ill-gotten gains. He refused to have them there again. Mr. Railton's ignorance of the customs of the country and people were much against his success and many blunders were made in selecting as leaders of meetings people who had no stability. After one year Railton was recalled and another leader sent out. General Booth called Major T. E. Moore to his side saying, "Moore, I want you to lead a forlorn hope. Will you do it? You have won your spurs here; God will help you there in America."

In the spring of the year 1881 Major Moore landed in New York finding nothing of Railton's organization left but a wreck encumbered with debts. In a little room in Philadelphia he began a work which has grown on this continent up to this date to nearly 400 corps, and 1000 men and women wholly engaged in it, who with their converts—soldiers as they are called—are on the streets of 400 towns and cities every night in the week proclaiming the gospel. Such a movement could not go on without attracting general attention and in some quarters it aroused political jealousies. Inquiry soon disclosed the fact that this movement was controlled by a foreign authority, in the hands of which was the absolute right to all the properties acquired by the Army. Three years ago discontent from this cause began to manifest itself and dissolution threatened the American organization. On the 24th October 1885 the present leader and general in America

secured a charter of incorporation under the laws of New York, and the organization in the United States became an independent American institution.

Opposition to the Army.

The *War Cry* says America has put more salvationists into prison than all the European countries put together. The charge against them on the police record is generally that of disorderly conduct based upon their street marching. They take no notice of prosecutions, claiming that while they may not adapt the gospel to the wishes of the people they are as free as birds in the air as to the measures they may use to bring it to the notice of the common people. As effectual to this end and as justifiable under the law they employ street-parades, banners, uniforms, popular songs, the music of the banjo and tambourine, a military discipline and phraseology and a variety of simple drills. The vast majority of those who daily speak at their meetings are ignorant of the language of Scripture and, indeed, of religious phraseology, but perhaps for that reason their appeals so touch the common people that thousands are led to join the Army. The use of brass bands, flags, uniforms, startling announcements and other peculiar means of attracting attention seems attributable to the knowledge that all ordinary means have utterly failed to arouse the masses to a sense of religious duty.

Statistics.

The income from the offerings of people benefited by the work of the Army amounted in the fourth year of its existence in the United States to $65,000, being $20,000 more than that of the parent organization in the mother country after it had been working for fourteen years. In Great Britain Booth asked for the irresponsible use of $150,000 to meet the expenses of the organization for 1886.

The majority of the converts of this society attach themselves to some church of their selection. The American branch has a board of five trustees with its officers and publishes a half-yearly balance sheet audited by a State commissioner. The headquarters are at the Lyceum in Brooklyn. The executive control of the work in the field is in the hands of the general assisted by a staff of his selection, and he assigns the duties and stations of the corps officers who may be of either sex and who bear titles assimilated to military service. In the year 1885 the society granted $7000 to the support of needy stations, paid $3000 of indebtedness and met all its current expenses, deriving its whole income from voluntary offerings made at its daily meetings. The entire Army, as reported by its international Congress held at London in the summer of 1886, numbered 1552 corps and 3602 officers wholly employed in its service who are operating in the following countries: Great Britain, France, Switzerland, Sweden, Canada, South Australia, New South Wales, New Zealand, Queensland, Tasmania, India, Ceylon, South Africa and Germany, besides the corps employed in the United States from the Atlantic to the Pacific coasts and forces preparing for China and the West Indies.

The official paper called the *War Cry* has a weekly circulation of over half a million and is published in seven different languages, the American edition being under the control of the general of that division of the Army. The Army in America increases at the rate of ten stations a month, and holds about 276,000 public meetings per annum, and its methods and aims are limited simply to quickening the conscience of the masses of the people and to awakening in them religious life.

T. E. M.

SANDERSON, John (1783–1844), an American author, was born at Carlisle Pennsylvania in 1783. He studied law in Philadelphia, but became a teacher, contributing occasionally to Dennie's *Portfolio*. In company with his brother he prepared the first two of seven volumes upon the *Lives of the Signers of the Declaration of Independence* (1820), a work which was continued by Robert Waln, Jr., revised in 1846 by R. T. Conrad, and embellished with portrait engravings and fac-simile letters in 1865 by William Brotherhead. Sanderson's health failing in 1835 he went to France, whence he wrote *Sketches of Paris* (1838), afterwards called *The American in Paris* (1847), of which Jules Janin made a French translation (1843). After his return he was professor of ancient languages in the Philadelphia High School. He died at Philadelphia April 5th, 1844.

SANDS, Robert Charles (1799–1832), an American essayist, was born in New York city May 11, 1799. The son of a merchant he was graduated at Columbia College in 1815. Before this date he had joined with J. W. Eastburn in publishing *Academic Researches* and afterwards with the same friend versified the Psalms of David and composed *Yamoyden* or the history of the Indian King Philip. After the death of Eastburn (1819) Sands associated with Bryant, Verplanck, Halleck and others in furnishing essays to *The Talisman* and other periodicals, and in 1824 edited the *Atlantic Magazine* afterwards the *New York Review*. In 1827 he became connected with the New York *Commercial Advertiser* in which was published his last poem *The Dead of* 1832. He himself joined their number, dying suddenly December 17 of that year. He had published the *Life and Correspondence of Paul Jones* (1831) and an *Historical Notice of Hernando Cortes* (1828), of which a Spanish version circulated widely in South America, but most of his poems and essays appeared in works of joint authorship. After his death they were collected in two volumes with a memoir by G. C. Verplanck (1834).

SANITARY COMMISSION (United States). Employed during a long period of peace in protecting a distant frontier from the depredations of Indians or in assisting scientific explorations the War Department of the United States confronted a new and complex undertaking when President Lincoln called into the field troops for the civil war. The army underwent a revolutionary expansion behind which legislation lagged. Linked as it was to every fireside in the land it also became the embodiment of an impassioned national purpose. In mediation between the rigor of military administration and household affection for the 2,700,000 soldiers sent to the field, more than half of whom were under 24 years of age, the Sanitary Commission found its opportunity. Local organizations had sprung into existence devoted to the comfort and welfare of the army. On behalf of one of these, the Women's Central Relief Association of New York a society which aimed to unite and systematize these independent endeavors, a conference was held between Rev. Dr. Henry W. Bellows, Drs. Van Buren, Harsen and Harris on one side and the Government on the other. These gentlemen thought the most alarming peril to beset the new levies would arise from bad sanitary conditions. They desired the Government to create a board authorized to inspect camps and hospitals, to recommend and where occasion demanded to enforce sanitary regulations, as was done by the British Government in the Crimean war. But the medical department, without the consent of which nothing could be done, doggedly opposed the plan. In deference to the popular feeling which was highly excited, and because the Government in its hour of trial could ill afford to alienate the good-will of the citizens, the medical bureau was willing to endure a commission without official position or power privileged to visit troops in the service and to make recommendations to the War Department for the preservation of their health.

Origin.

On the 9th of June 1861 the Secretary of War authorized Rev. Dr. Bellows, Professors A. D. Bache and Walcott Gibbs and Doctors Jeffries Wyman, W. H. Van Buren and S. G. Howe, with three army officers, A. E. Shiras, G. W. Cullum and Dr. R. C. Wood, to act as such a board and to associate others with them as they thought best. The meagre coun-

tenance shown by the Government, which at first disheartened the originators of the plan, proved in the end to be an advantage. The Commission escaped the stifling limitations of official position and throwing itself upon public favor was able to organize the vast compassion of the nation.

Relation to the Government.—From the outset the Commission was drawn into two distinct lines of work reciprocal in effect but never obscured or confused; the one was sanitary or preventive, the other was relief work, or providing the agencies by which the ceaseless generosity of his kindred and friends might reach the soldier in permissible and convenient form. The preventive work lay near the heart of the Commission as being the most productive of humane results, but it was the more difficult undertaking because it could only be accomplished by bringing the officers of the Government to accept their recommendations, and because its importance was not appreciated either by the people or by those in authority.

Official deportment.

From a high sense of patriotism, as well as because its influence in official circles, through which its sanitary measures were to be executed, depended thereupon, the Commission promptly took the ground that the Government "was the soldier's richest, ablest and most constant friend," that all intermeddling with official requirements was to be avoided, that military discipline was to be respected in speech and act. By the tact with which its representatives adhered to these principles unobstructed access was gained to all divisions of the army during the entire war. From beginning to end the administration was reserved and in some quarters jealous in its attitude towards the agents of the Commission; but they learned to encounter this spirit with self-restraint and acquired an etiquette conformed to their position. As the medical bureau of the army was the focus upon which the sanitary plans of this merely advisory board converged, and as that bureau was deeply affected by obsolete traditions and obstructive punctiliousness, successful measures were taken in Congress early in 1862 to place its direction in more proficient and courteous hands. This secured, the independence of the Commission gave scope for the freer and larger development of its machinery, the cooler and skilfuller conduct of its agents and the acquisition of a more commanding influence over the inflamed impulses of the people. In order to supply that studious research and those facilities and stores for which no governmental provision was made, or which the emergencies of campaigning at times rendered unavailable through regular army channels, a system of inspectors was established to whom were confided such duties as required contact with those in authority and the direction of operations in the camps. These inspectors were usually men of wide medical learning and of social position. They with the other field agents were pledged to a definite term of service, were subjected to a drill in the requirements of the Commission and to such military discipline with promotion for merit as the conditions of the service would allow. They were instructed to seek admission to the army through the officers in command whither they went and do nothing without their consent.

Inspectors.

A corps of sixty inspectors under Dr. Henry G. Clark of Boston took in charge the visitation of the hospitals with a view to discover measures which would bring these to the highest efficiency. Out of the information thus gathered grew the plan and management of the American pavilion hospitals adopted by the Government, the excellence of which was of so superior a character that Dr. Brown-Sequard said their vital statistics were at first received with incredulity by the medical profession of Europe. Since then their leading features have been incorporated into recent extensions of the hospitals of Boston, New York, Philadelphia, Baltimore and San Francisco, and have obtained recognition in the systems of Europe.

The medical department of the army was dependent upon the quartermaster for its transportation and there were constantly recurring circumstances when it was without adequate facilities for moving its stores and caring for the sick and wounded. The Commission purchased trains of wagons and horses, chartered at the expense of the Government and fitted up steamboats, constructed and employed hospital cars the invention of Dr. Elisha Harris one of the Commissioners, all of which were pushed forward wherever active operations were going on. The hospital car was hung on springs, was constructed to receive the common field stretcher as a hanging bed and was provided with medical attendance, food, medicine and drinks. It was eventually adopted by the medical department and the service transferred to its officers. For this humane invention the "grand medal" of the Paris Exposition of 1867 was conferred upon the Sanitary Commission. These measures initiated by the Commission contributed to an ambulance and transportation system for the wounded which, by act of Congress in 1864, was made uniform for all the armies of the United States and which attained such respect abroad that it was employed in the Franco-Prussian war of 1870.

Transportation.

At Antietam, the Baltimore and Ohio railroad being blocked on the line of communication between the battle-field and the base of supplies, for four days the medical director received no Government stores. Anticipating this emergency the Commission had for several days pushed forward a wagon train of surgical and hospital supplies, while it succeeded in placing at Frederick, Maryland, 4000 suits of hospital clothing and 120 bales of blankets. That engagement left 9416 Union and several thousand Confederate wounded on the field. Until communications could be reopened these were largely dependent upon the provision made by the Sanitary Commission, which in one week distributed nearly 30,000 articles of apparel, five tons of farina, condensed-milk, canned meats and beef-stock, 3000 bottles of wine and cordials and tons of fruit together with minor stores.

Battle-field relief.

After General Rosecrans's retreat from Chickamauga he was shut up in Chattanooga with 80,000 troops, several thousand wounded and 60,000 beasts of burden from the 22d of September to the 28th of October, when the operations of General Hooker partially lifted the embargo. During this time his single line of supply was by a circuitous mountain road in wretched condition to Bridgeport on the river 30 miles away. To the invested army the Commission sent out seventeen wagons, of which ten were intercepted by the enemy but seven got through with the first army train, and their contents were the main reliance of the medical department there. At Gettysburg two loaded Commission wagons appeared on Cemetery Hill on the first day of the battle. Before the lines of communication were restored its trains were daily urged forward by independent routes from near depots which had been established in anticipation of the conflict. Within ten days from the battle these measures placed at the service of the medical staff at Gettysburg 100,000 pounds of various forms of food for hospital use; nearly 5000 bottles, jars and cans of stimulants and preserves; over 63,000 separate articles of apparel, of bedding and of toilet service; besides boxes of fruit, baskets of fresh vegetables, disinfectants, surgeons' supplies, fans, candles, lanterns and writing paper. During the eight days' combat between Generals Grant and Lee in the Wilderness, when 30,000 wounded men fell under the care of the medical director of the Union army, the Commission placed within his reach 200 tons of stores and 200 relief agents. These are illustrations, drawn it is true from the most sanguinary battles, of the operations of the Commission in the field. Of the 700 conflicts of the civil war the Sanitary Commission was represented at 600, and in its care for the wounded no distinction was made between

friend and foe. It fitted out a medical and relief staff to accompany every expedition of the army from Texas to the Chesapeake.

Among preventive measures the attention of the Commission to dietetics was of incalculable value. Against diseases incident to camp life it was well nigh impracticable for the Government to take commensurate precautions, because of the sudden and enormous expansion of the army and the inexperienced personal material thus brought to hand. While many of the regimental surgeons were tried and capable men more were young, unpracticed and of moderate ability. The inspectors of the Commission supplied these men with especially prepared publications upon the sanitary requirements of an army, sought their confidence and friendship, prompted, entreated and persuaded them until the medical department could acquire a thorough supervision of its extended organization and enforce creditable methods upon its subordinates. But apart from questions of camp sites, cooking, drainage and cleanliness, was that of food; the commissariat of an army seldom affords a dietary varied to suit changing localities and conditions. At the first appearance of scurvy, which was among the troops in Tennessee, the Commission appealed to the farmers of the Northwest who from their own bins immediately supplied it with 15,000 bushels of fresh vegetables, although the markets of that region could not furnish them to the government purveyor. These with other anti-scorbutic food were systematically distributed where the scourge menaced until it disappeared. This experience led to the establishment of extensive truck gardens at Nashville, Chattanooga, Knoxville, Newbern and Murfreesboro, from the second of which in the farming season of 1864 the product was valued at over $55,000.

Dietary.

While the army besieging Vicksburg was crowded in the trenches and oppressed with the fatigues of a long siege, again at Chattanooga in the winter of 1863–4 where the troops destined for the march through Georgia were detained by lack of transportation and the necessity of reorganization, at Newbern when the yellow fever assailed citizens and garrison alike, at Knoxville while General Burnside was cut off from support and besieged, through the weary months when General Gilmore was bombarding Charleston from Morris Island where the water was not fit to drink, the agents of the Sanitary Commission appeared in all these camps with ice, fruits, vegetables and other stores selected with reference to the evils encountered in each situation. They fought scurvy, diarrhœa, typhoids, malaria and yellow fever each with the best preventives known to science. The boats of the Commission patrolled the Mississippi and its tributaries from Louisville and Cairo to the Gulf to supply the military posts scattered along them with anti-scorbutic food. Its messengers were in every general hospital on the same errand from the convalescent far away in the rear to the pavilion hospital at the base of active operations.

Relation to the Soldier.—Frequent occasions arose when the soldier was practically out of the oversight of the Government for a time. There were other occasions when he was not on the effective list and the austerity of discipline was relaxed, and then wants appeared which were not contemplated in the army regulations but which the Government was quite willing for civilians to alleviate in an orderly way. In the first class were the new enlistments on their way from recruiting to great distributing stations near the front, soldiers discharged from regiments in the field or from hospitals, disabled men on furloughs and prisoners of war paroled or just exchanged. Thousands of men on their way to join their regiments arrived daily at Washington and Louisville. Often they were under incompetent officers, had been detained in crowded barracks awaiting transportation, were long on the road and on reaching their destination remained for hours awaiting assignment to their quarters and the regular issue of rations. Soldiers whose term of enlistment had expired, or who were honorably discharged on account of disability, were constantly leaving their regiments or the general and convalescent hospitals to seek their homes. In many cases they were ignorant of official routine and encountered difficulty in getting their pay or papers; often they were in feeble health; when paid they were beset by swindlers and runners for disreputable places; at times they were discouraged and suffering from exposure and self-neglect.

These conditions were more frequent in the early days of the war when the reorganization of the army was in a crude and changing stage, when officers were inexperienced and when facilities for transportation and supplies were in the process of creation. Then the Commission began what it termed its "special relief" which soon grew to such proportions as in public estimation to overshadow all other branches of its work. It first provided lodges where broken-down recruits could be received and restored to health. These resting-places soon passed into a system of well-organized "homes," comprising forty separate establishments located near the great depots of transportation from Boston to New Orleans. From them issued the extemporized supplies of coffee and food with which regiments were regaled on their way to the front. Here were received those soldiers who fell ill in their journeyings, or who had got displaced and bewildered, or who had lost their papers or were out of money, or who from any misfortune were in "irregular circumstances." It is estimated that the inmates of these homes averaged 2000 daily during the war. On one occasion 8000 wounded men were fed together for two days through this agency. It supplied 1,000,000 nights' lodgings and over 4,500,000 meals to the troops during the war. In assisting soldiers to obtain their pay or official documents to prove their conformity to army regulations agents of the Commission secured the acquittal of numbers of them charged with desertion, rescuing some from the sentence of court-martial.

Temporary homes.

Paroled and exchanged prisoners were received with attention to their especial conditions and helped forward to their destination. Facilities were furnished to protect the soldiers from sharpers and dissolute associations.

The Commission also acted gratuitously as the soldiers' attorney and collected for them $2,500,000 of their pay. This branch of the service was organized at the close of the war as a Pension and War Claim Bureau through which 57,000 claims of discharged men and of soldiers' widows and orphans were reduced to order, fortified by evidence and collected to the amount of $7,500,000 under conditions which otherwise would have involved great expense to the claimants, if not injurious delays or ultimate failure.

Pensions and claims.

For those who were in regular relations to the Government two forms of aid were provided: one known as "general relief," which concerned the inmates of the various hospitals, and the other known as "battlefield relief." In describing the relations of the Commission to the Government these forms of service have in part been anticipated. Besides the inspectors and relief agents who were attached to each column and followed its movements, there was a supplementary corps which at times contained 150 persons a number of whom were women. These were educated and competent persons who acted under a superintendent. From this corps details were pushed to the rear of the great battlefields to assist in carrying the wounded to the general hospitals at the base of supplies. It established feeding stations along the road for the refreshment of the injured, performed by the bedside the duties of skilled nursing, prepared dainty food for the sick, distributed

General relief.

reading matter among the troops, wrote letters home for the soldiers and telegraphed to the friends of the dying. In the large convalescent camps which the Government established this auxiliary corps was particularly active. Through the one near Washington 200,000 men passed during the war, and in the six months following the Chattanooga campaign 100,000 men found repose in the one at Nashville. Such vast numbers of men required ceaseless care and attention.[1] The fatigues and hazards of this corps are illustrated by the capture at Gettysburg of four men wearing its badges who were incarcerated in Libby Prison at Richmond for months, and by the death of several of its representatives both men and women who were broken down by the drain upon their sympathy and strength. One of its members while on his humane duties in the field was shot by the enemy and killed.

Hospital Directory.

In the prosecution of the "general relief" a Hospital Directory Office was established in Washington with branches at Louisville, Philadelphia and New York. On the books of this office the names of over 600,000 private soldiers, taken from reports of about 240 army hospitals, were entered with the latest information procurable concerning each one in preparation to meet the inquiries of their relations and friends. Of these inquiries at least 70 per cent. were answered with definite information to the great consolation of soldiers and their kindred.

Relations to Citizens.—An invaluable service to the country was rendered by the Sanitary Commission in its mediation between the Government and a community deeply agitated by the afflictions of war and impatient of official obstructions between it and its sons and brothers in the camp. Here the refusal of the Government to confer upon it official functions became of great advantage, for had it been incorporated into the military administration it would have lost that freedom for organization and that dependence upon public sympathy which gradually made it the vehicle of a nation's bounty. As a popular organization it soothed the perturbation of the people, guided their impassioned exuberance, arrayed their energies in support of the Government, and gratified their affections by directing their labors into effectual services.

Popular unanimity.

When hostilities began the several States adhering to the Union set on foot schemes for transporting the sick and wounded of their own contingent of troops and for administering to its comfort. Deprecating the inequalities, confusion and acerbities certain to arise from so many rival agencies the Commission resisted these discriminations through many a trying collision and advocated the submersion of local partialities in a national patriotism. The extension and increasing excellence of its service over the whole line of military operations enabled it gradually to incorporate as auxiliaries hundreds of local associations, and to end their waste of misapplied energy and their contention with an inexorable discipline which could not tolerate in camp a host of visitors each intent on his own errand. To secure concord of action these societies yielded their desire to select the objects of their care and consented to create a common stock to be impartially applied to those only who were in need through a system of official requisitions. As the Commission came more and more to represent popular unanimity and to control the large resources which private generosity, as it was stimulated and methodized, was continually augmenting, it acquired new influence with the Government which the more willingly received its suggestions and increased its army privileges. The result was a mutual conciliation of feeling between the Government and its citizens, and a growing adjustment between arrangements prescribed by authority and those invented by the people. By these means the Government was reinforced and discipline respected, while the soldier received the largest measure of benefit to be extracted from the provisions made for him.

[1] In this branch of work representatives of the Christian Commission participated, and their stores were often replenished from those of the Sanitary Commission. The former organization began with the New York Young Men's Christian Association and took national form in November, 1861. It aimed chiefly at providing religious consolation for the army and its operations were supplementary to the chaplaincy staff. Its story is told by Lemuel Moss, D.D. in the *Annals of the U. S. Christian Commission*, New York, 1866.

Organization.—The Sanitary Commission was preeminently the medium through which women contributed voluntary sacrifices to their imperilled country. It had its initiative in a Women's Aid Society; its constituency comprised more than 7000 auxiliary associations most of which were composed of women and directed by them. Lives of repressed anxiety for husbands, sons and brothers enduring the privations of the camp or facing the hazards of the field were exchanged for active duties which gratified the domestic love of women, beguiled their distresses, mustered them as a component part of the national strength and opened for them opportunity to arouse enthusiasm, to resist discouragement and to unite the feeling of the loyal States. These 7000 local societies grouped themselves about great centres of distribution where branches of the Commission were established, as at Boston, New York, Philadelphia, Cincinnati, Cleveland, Columbus, Detroit and Chicago. From these centres women of commanding discernment and discretion came to Washington from time to time for conference, when plans were made for multiplying auxiliaries and for collecting and distributing supplies. Other women appeared in the general hospitals from those erected on the hard-fought battle-fields, as at Gettysburg, to those for convalescents securely in the rear. They organized companies of nurses and light-diet kitchens; they distributed clothing and reading matter; they communicated with the friends of the sick; they answered letters of inquiry; they rendered every service compatible with discipline in their power which might contribute to the soldier's welfare.

Women's services.

To aid the Central Branches "associated members" were selected in the chief cities—men of recognized position and efficiency—who gave the women the benefits of their counsels in matters of business, who devised methods of raising money and made purchases of material. Over all was the Board with headquarters at Washington. The original Commissioners appointed by the Secretary of War with power to increase their number associated in all fourteen others with them, of whom two never took their seats and four including the three staff officers from the army resigned in 1864. This Board, except during the first year of the war when its sessions were twice as frequent, met quarterly at Washington where it had apartments provided by the Government for the transaction of its business. Through its secretary it received reports of its several bureaus. It defined the policy and measures to be pursued and committed their execution to officers whom it placed at the head of its various branches of service. To meet the increasing exactions of its work the Board early created a Standing Committee which had its headquarters at New York and remained to the end of the war in daily session. It consisted of Rev. Dr. Bellows, Drs. Van Buren and C. R. Agnew, Professor Gibbs, Mr. G. T. Strong and Chas. J. Stillé who was latest added and became the authorized historian of the Commission.[1]

The executive duties of the Board fell upon two of the Commissioners. Mr. F. L. Olmsted for the first two years was general secretary and was stationed at Washington. Perceiving the details of vast and intricate business designs in methodical groups and fertile of invention Mr. Olmsted possessed a fine power of impressing his views upon his colleagues and of in-

[1] History of U. S. Sanitary Commission, New York, 1866.

spiring his agents with enthusiasm and subordination. To his wise conduct may be attributed much of that prudent and astute adaptation to opportunities which planted the Commission firmly in the confidence of the people, and that disciplined zeal which secured to its agents access to every regiment and hospital and made possible the concentration of relief at any part of the line of operations from the Potomac to the Gulf of Mexico. His duties were shared with Dr. John S. Newberry who was made secretary for the Western department and stationed at Louisville and who at times was necessarily left to exercise much discretion. So sagacious was his administration and so much freer from officialism were the armies in the West than those more immediately under the influences of Washington that from their commanders to their lieutenants the agents of the Commission were received with friendliness and aided by army orders. Mr. Olmsted was succeeded as general secretary by Dr. J. F. Jenkins and he in turn by John S. Blatchford to whom the organization of the Historical and War Claim bureaus is chiefly due. The finances were in the custody of George T. Strong under whom the vast business of the treasury was conducted without a doubt cast upon the integrity of any agent of the Commission.

Pay.

While the commissioners served in the Board without pecuniary reward the policy was adopted of paying its officers and agents on a scale corresponding to that of the army for equivalent services and retaining them as long as there was need of them. At times there were 500 persons on the pay-rolls from inspectors to laborers. In emergencies and especially after great battles gratuitous aid was freely offered and accepted and under these circumstances it was invaluable, but such systematic, extended and continuous functions as fell to the Sanitary Commission required a firmer reliance than the impulsive services of inexperienced hands bound only by their own convenience.

Supplies.

Resources.—The resources of the Commission were of three kinds; stores, cancelled claims for services, and money. Supplies were gathered by individuals and by thousands of local associations and poured in continuous streams into the depots of the Branch Societies established in the chief cities of the North. They comprised a miscellaneous assortment from the clothes-presses, the sleeping apartments and the larders of the citizens, and among them were pathetic disclosures of penury and love. These collections were assorted, repacked and distributed under orders from Washington. As spontaneous contributions could not anticipate all the requirements of the camp and hospital the Commission found it necessary to establish agencies for communicating with the people and directing their beneficence. Circulars emanating from Washington and calling for special stores were distributed through the Branch Societies amongst their auxiliaries and over the loyal States. By such means the large supply of vegetables already mentioned was elicited from the Northwest. Agents travelled over the country explaining the operations of the Commission and stimulating the formation of local tributaries. Two official papers, the *Sanitary Reporter* in the East and the *Sanitary Bulletin* in the West, circulated among the people apprising them of the manner in which their bounty had been applied and of the most desirable contributions for prospective use. The distributing offices were at Washington whence all administrative orders issued and at Louisville, and vast depots of supplies were created here. From these points came the requisitions for stores and the directions how and where to ship them. The estimated value of the material thus gathered is put at $15,000,000.

The Commission also enjoyed free transportation from railroad and express companies and the telegraph lines were gratuitously at its service.

Money.

During the first fifteen months of its history the Commission received but $158,501 while the expenses of its hospital transport system alone had risen to $20,000 a month. Through this trying period the existence of the organization was exceedingly precarious. Suddenly in September 1862 California, desirous of participating in the sacrifices of the country from which her remoteness largely exempted her, placed $100,000 in one gift in the treasury following it two weeks later with another equal contribution. From that time money came forward promptly and freely but the remittances from the Pacific coast continued greater in proportion to the population than from any other part of the country. They were as follows:

California	$1,233,977.81
Nevada	107,642.96
Oregon	79,406.94
Washington Territory	20,918.92
	$1,441,946.63

When Gen. Grant came to the chief command of the army the enthusiasm of the country was roused to the highest pitch and about three-fifths of the treasurer's receipts came in during the last year of the war. Early in 1864 the friends of the Commission set on foot the gigantic enterprises known as "Sanitary Fairs." Their names, locations and results are as follows:

Albany, N. Y.	$80,000.00
Baltimore, Maryland State Fair	40,234.54
Boston and New England Fair	50,000.00
Brooklyn and Long Island Fair	305,513.83
Flushing, L. I.	3,934.32
Hornellsville, N. Y.	800.00
New York, Metropolitan Fair	1,184,487.72
Philadelphia, Great Central Fair[1]	1,035,398.96
Poughkeepsie, N. Y.	16,192.27
Schuyler County, N. Y.	1,287.43
South Adams, Mass	3,087.04
Warwick, Orange County, N. Y.	1,432.73
Wheeling, W. Va.	2,500.00
Yonkers, N. Y.	12,000.00
	$2,736,868.84

From other sources $745,665.52 came into the treasury and this amount includes $17,955.51 from the Sandwich Islands; $18,412.85 from Buenos Ayres; $50,797.59 from the British Empire, of which $36,790.42 came through the London Branch; $16,922.72 from France, of which $13,372.72 came through the Paris Branch; $5,376.79 from Chili; $7,989.90 from China and Japan; and smaller sums from other foreign countries. Though the receipts were credited by States in the final report there was no system of State collections and the great Branch Societies were replenished without much respect to boundary lines. The aggregate poured into the general treasury was $4,962,014.26, and it is estimated that $2,000,000 more were raised and expended by auxiliary associations in furtherance of the interests of the Commission which do not appear in its accounts. The president of the Commission thought $25,000,000 to be a round valuation of the bounty it administered during its history.

Scientific Results.—Aware that efforts to alleviate the miseries of a sanguinary war had a permanent and world-wide value the Commission established a Department of Vital Statistics early in its history and maintained it to the end. Forms were carefully prepared to be filled up by inspectors and on them 1482 returns of camp inspections were received representing 870 regiments. These were assorted and combined in such ways as would exhibit the principles of correct sanitation, the value of dietaries, the most healthful hospital conditions, the effect of equipments and of marches, the measurements of men, and the relation to vitality and military service of nationality, education, previous occupations, climate and age. The

[1] See *Memorial of the Philadelphia Central Fair for the U. S. Sanitary Commission* by C. J. Stillé, LL.D., 1864.

management of these statistics was committed in 1863 to the astronomer Dr. Benj. A. Gould, and while they were primarily applied to the induction of methods of practical humanity they also became the basis of formulas for the distribution of population and of anthropological tables of great value. The publication of reports from this bureau and Dr. Gould's *Discussion on the Statistics of the U. S. Sanitary Commission* attracted scientific attention everywhere. The experience thus preserved and exhibited has borne fruit in the modification of European military systems and in the better organization of the medical service of the United States army and navy. Not least in practical value is the demonstration that federated states wisely led will abate their local jealousies and act with unanimity outside of legal formulas, and that the spontaneous activities of a free people in times of deepest excitement can be harmonized and subordinated to the authority and disciplinary rigor of a representative Government when danger has rendered it most arbitrary. (D. O. K.[1])

SANTA ANA, Antonio Lopez de (1798–1876).—This adventurer, dictator and soldier, born at Jalapa in the State of Vera Cruz (21st Feb. 1798), attained to a lieutenant-colonel's rank in the Spanish army while it was engaged in putting down the patriot insurgents of the war for Mexican independence. Near its close (1821) putting himself at the head of the national faction in Vera Cruz he expelled the royalists from that city and secured its adhesion to the "plan" of Iturbide, but within seven months from the proclamation of the Mexican empire by the army he turned against his imperial chief, and the standard of republicanism was first set up in that country by his comrades. To avoid civil war Iturbide abdicated, the republic organized and formed the constitution of 1824.

Santa Ana again emerged in 1828 from private life as the supporter of his associate in the conspiracy against Iturbide, Vincente Guerrero, when that soldier struggled for supremacy against Gomez Pedrazza the head of the aristocratic party, and seized for him the important city of Oaxaca, which he successfully defended against a stubborn siege. Guerrero, clothed with dictatorial power in view of the attempt of Spain to recover her ancient colony, sent his lieutenant against the invaders who compelled them to capitulate at Tampico (11th Sept. 1829), where they had disembarked, and by this exploit became the popular hero. He next, under Vice-president Anastasio Bustamente whom he subsequently exiled, turned his arms against the dictator (1829), then against the successful Bustamente (1832) compelling him to give place to their old adversary, Pedrazza, whom in turn, after three months of administration, he deposed in the following year.

Mexican politics now began to change from contests between social classes and races to those between policies, and Santa Ana at the head of the newly formed liberal party succeeded Pedrazza in the presidency. His administration began with an attack upon the income and property of the privileged Church. Convenient invalidism was his excuse for devolving the execution of this policy and its attendant risks upon the Vice-president, and when the inevitable reaction came he resumed his official duties, but as the champion of the ecclesiatical party which now abolished the constitution, made its chief a practical dictator and attempted by the organic law of 1835 to obliterate the independence of the several States of the Union. This centralization of authority Texas, to which American refugees and colonists had long been streaming, answered with the organization of an independent government and the expulsion of the federal forces from all the territory north of the San Antonio river. Into this State Santa Ana led his troops, butchered to the last man the garrisons of Alamo and Goliad, was overwhelmed on ground of his own selection at San Jacinto (21st April 1836) by the assault of a force half as large as his own, and in his imprisonment acknowledged the independence of the new republic. President Jackson returned him to his own country the next year in a United States naval vessel, and from the obloquy of his Texas campaign he recovered by the skilful defence of the fortress of Vera Cruz in 1838 against a French bombardment, in which action he lost a leg.

Again a popular leader Santa Ana obtained provisional control of the government for three months in 1839, when a period of turbulence ensued, during which he led the centralist party and exercised a virtual dictatorship from 1841 to 1844. To avoid the gathering resistance to his personal administration he then submitted to the limitations of a constitution framed in the preceding year, but it was too late, and a revolution of 20th Sept. 1844 deposed him from power and sentenced him to a ten years' banishment for treason.

The dispute with the United States over the Texas boundary led to the invasion of Mexico by General Taylor, when Santa Ana secretly left his refuge in Havana, and returning to his country was received as an invincible soldier, given command of the army and in December was at the head of the nation under the restored constitution of 1824. His campaign against General Taylor's invading force coming from the north which ended in the President's inglorious defeat at Buena Vista, and against General Scott marching from Vera Cruz which ended in the dispersion of the last remnant of the Mexican army by General Lane at Huamantla, belong to the history of the United States (*q. v.*), but they terminated Santa Ana's irregular and arbitrary government and sent him (5th April 1848) into exile in Jamaica and South America. Five years later the revolutionary successes of the centralists recalled him and for a fifth time placed him in the presidency. For two years the country endured his arrogation of lofty titles, of despotic functions, of a life tenure of supreme authority and of a right to appoint his own successor, and then he fled, after a single encounter at Saltillo, before the irruption of Alvarez's Indians from Guerrero. He was tried again for treason, banished and his large estates confiscated by the government formed under Alvarez's "plan of Ayutla." Since then Mexico remained free from the turbulence of this clever schemer, and her constitutionalism has been stable.

In his new exile he vainly offered his services to Marshal Bazaine when the French invaded Mexico; he obtained the empty title of marshal from Maximilian but not the opportunity to return home; he schemed from a refuge in New Jersey to gain some recognition from Secretary Seward in Washington and from President Juarez; he entered Yucatan on the downfall of the empire, was captured, sentenced to be shot and escaped by the commutation of his sentence to banishment. After the death of Juarez he quietly left his residence in New York, and for two years found an unmolested home in the City of Mexico, where he lived in poverty and obscurity. His death occurred on 20th June, 1876. (D. O. K.)

SARGENT, Epes (1812–1880), was a poet, novelist, dramatist, editor and educator. Born in Gloucester, Massachusetts (27th September), his places of residence were Boston and New York. His poetical tastes found expression in *Songs of the Sea* (1849), a volume of much pictorial fancy which Edgar A. Poe favorably criticised. It contains the once popular song "A Life on the Ocean Wave." He also published a second book of *Poems* (1858), and *The Woman Who Dared* (1869) a tale in verse. Editions of the poets Campbell, Samuel Rogers, Collins, Gray, Goldsmith, Hood and James and Horace Smith, with annotations and memoirs added by his pen, passed through the American press under his supervision.

[1] The writer is under obligations to the official historian of the Commission for material furnished in the preparation of this article and for final examination given to it.

As an editor he was connected with the following monthlies: *Parley's Magazine*, *New England Magazine* and *New Monthly Magazine*, while he contributed to the *Knickerbocker* and the *Atlantic Monthly*. He also was associated with these dailies: the *Mirror* of New York and the *Advertiser*, *Atlas* and *Transcript* of Boston. In bookmaking he assisted S. G. Goodrich in the production of the Peter Parley series which ran to 116 volumes and sold literally by millions, and in the publication of a series of *Annuals*. He also edited the *Select Works of Benjamin Franklin* including the autobiography, to which he affixed a memoir and annotations (1853).

As a dramatist his plays were produced with success on the stage, and two of them enjoyed a high reputation for a time. *Velasco* (1837), a tragedy, was written for Ellen Tree and was produced in England where Sir Thomas N. Talfourd praised it. A second tragedy, *The Priestess*, appeared in 1855. In comedy Sargent's first and best received play was written for the actress Josephine Clifton, and was entitled *The Bride of Genoa* (1836). *Change Makes Change* was successfully represented in New York and Philadelphia. From 1846 to 1856 he passed seven volumes containing 52 plays through the press under his editorship, which form the first part of a series entitled *Modern Acting Drama*.

In fiction Mr. Sargent left two tales for the young which were read with avidity on their appearance: *Wealth and Worth, or Which Makes the Man* (1840) and *What's to be Done; or the Will and the Way* (1841). Two novels for maturer reading are *Fleetwood, or a Stain of Birth* (1845), and *Peculiar* (1863) a tale of slavery which was widely read.

Other prose works from his pen are: *Life and Services of Henry Clay* (1842) a biography which its illustrious subject commended as the most satisfactory to himself and which Horace Greeley completed on Clay's death, *Mariner's Library*, *American Adventures by Sea and Land* (1847), *Arctic Adventures* (1857) and *Planchette, an Account of Modern Spiritualism* (1869), a subject which engrossed much of Mr. Sargent's time and sympathy in his later years.

He was a prolific author of a profitable series of school-books, including an etymology, speakers, readers and spelling-books, all of which had a wide circulation. He died on December 30, 1880.

His brother, JOHN OSBORNE SARGENT (*b.* 1810), a lawyer by profession, founded a student's periodical at Harvard called *The Collegian*, and a Whig newspaper in Washington, D. C., entitled *The Republic* (1849–1853), between which events he was editorially connected with the Boston *Atlas* and the New York *Courier and Enquirer*. He published a memoir, which has been reproduced in several European countries, of the great engineer John Ericsson prefixed to a lecture on steam navigation.

SARGENT, LUCIUS MANLIUS (1786–1867), a philanthropist of Boston birth (25th June), and a grandson of Colonel Epes Sargent (1690–1762), became distinguished as the author of *Temperance Tales* (6 vols., edition of 1863–4) which had a wide circulation at home, in Great Britain, Germany and Australia. From Harvard College he went to the law-office of Samuel Dexter of Boston, *Reminiscences* of whom he published in 1858. Much of his literary work first appeared in the Boston *Transcript* and was afterwards published in book-form. Among these works are one of curious lore entitled *Dealings with the Dead, by a Sexton of the Old School* (1856), and a history of the slavery agitation in Congress called the *Irrepressible Conflict*. Besides some early translations from the Latin he published a book of poems, *Hubert and Ellen* (1812), as well as occasional writings in verse. Died at Roxbury, Mass., 2d June 1863. Two of his sons were meritorious cavalry officers in the civil war: General Horace Binney Sargent (b. 1821) named for the eminent jurist who was his grandfather, and Lucius Manlius, Jr. (1826–64), who was killed while leading the 1st Massachusetts Cavalry in action at Belfield, Virginia.

A brother of the older Sargent, Henry (1770–1845), was a pupil of Benjamin West, resided in Boston, and was known to the public by the wide distribution of engravings of his painting entitled *The Landing of the Pilgrims*.

A more distinguished relative was WINTHROP SARGENT (1825–1870), who bore the name of his grandfather (1753–1820) a sea-captain of Gloucester, Mass., then surveyor-general of the Northwest Territory, a soldier in the Miami Indian wars and one of the earliest governors of the Mississippi Territory. The younger Sargent was born in Philadelphia, practiced law there and in New York and died in Paris. A frequent contributor to the more erudite of American magazines his title to permanent remembrance rests upon antiquarian research. He wrote a *History of an Expedition against Fort Duquesne under Braddock* (1855) and a *Life and Career of Major John André* (1861). He edited *Loyalist Poetry of the Revolution* (1857) and his grandfather's *Journal of the Meeting in* 1784 *of the Cincinnati Society* (1858). At the time of his death he was engaged upon a systematic catalogue of books relating to America.

SAVAGE, EDWARD (1761–1817), an American portrait painter, was born at Princeton, Massachusetts, and after a career as a goldsmith studied painting in London with Benjamin West and in Italy. His chief production was the Washington Family (1792) which he also engraved. He founded a museum in New York and some years later removed it to Boston. He died at his native place in July, 1817.

SAVAGE, JAMES (1784–1873), an American antiquary, was born at Boston 13 July, 1784. He graduated at Harvard College in 1803, entered upon the practice of law in 1807 and held several minor political offices in his native city and State. He died March 9, 1873. Besides contributions to the *North American Review* and other periodicals he published a *Genealogical Dictionary of the first Settlers of New England* (4 vols. 1860–62), in the preparation of which he had spent twenty laborious years. He also edited Winthrop's *History of New England from* 1630 *to* 1649 (2 vols. 1825–26), and while president of the Massachusetts Historical Society assisted in other publications relating to the early history of New England.

SAXTON, JOSEPH (1799–1873), an American inventor, was born at Huntingdon, Pa., 22 March, 1799. He early displayed mechanical ingenuity, improving the machinery in his father's nail factory and constructing a printing press. At the age of eighteen he went to Philadelphia, and while employed by a watchmaker invented a machine for cutting the teeth of chronometer-wheels. While residing in London (1831–7), he became a friend of Faraday and was made an assistant in the Adelaide Gallery. Here, besides constructing a magneto-electric machine, he made for Wheatstone the apparatus by which the velocity of electricity in its passage through a coil of wire was measured. Other of his inventions were the locomotive differential pulley, an apparatus for measuring the velocity of vessels, and a medal-ruling machine. He was recalled to the United States to take charge of the machinery of the United States Mint at Philadelphia. He also constructed the standard balances for other mints and assay offices. In 1843 he went to Washington to prepare the weights and measures to be used by the Coast Survey. Among his later inventions were the deep-sea thermometer, self-registering tide-gauge, and the immersed hydrometer. He died at Washington, 26 October, 1873.

SAY, THOMAS (1787–1834), an American naturalist, was born at Philadelphia 27 July, 1787. In 1812 he joined with others in founding the Philadelphia Academy of Natural Sciences of which he was first curator. "He resided in the hall of the Academy,

where he made his bed beneath the skeleton of a horse, and fed himself on bread and milk; occasionally he cooked a chop or boiled an egg, but he was wont to regard eating as an inconvenient interruption to scientific pursuits." In 1818 he went with Messrs. Maclure, Ord and Peale on a scientific exploration of the islands and coast of Georgia. In 1819 he was chief geologist in Major Long's expedition to the Rocky Mountains, and in 1823 went to the source of St. Peter's river. His collection of plants made on this journey was catalogued by L. D. VON SCHWEINITZ (*q.v.*). In 1825 he joined with Maclure and Robert Owen in the communistic settlement at New Harmony, Indiana, and after Owen's withdrawal remained there as agent of the property until his death, 10th October, 1834. He was a frequent contributor to scientific publications. His principal work is *American Entomology* (3 vols. 1824–8) of which a new edition, with memoirs by Dr. J. L. Leconte, was issued in 1859. Of his *American Conchology* only 7 numbers were issued in his lifetime, but his complete writings on this subject were edited by W. G. Birney in 1858.

SCHLATTER, MICHAEL (1716–1790), a German-American missionary, born on 14th July at St. Gall, Switzerland, was ordained in Holland and in 1745 was assistant minister at Wigoldingen in the canton of Thurgau, Switzerland. The next year he was sent as a missionary to the Germans in Pennsylvania, and soon after his arrival became pastor of the Reformed Church in Philadelphia, to the duties of which office he added those of a missionary among the 30,000 Germans settled east of the Blue Ridge from Virginia to New Jersey. The Synod or Coetus of the German Reformed Church was formed 29th September, 1747, under his direction. He went to Holland in 1751 to procure men and money for his work, returning the following year with six ministers. In 1755 he resigned his pastoral charge to superintend a system of "charity schools," which through some political entanglements proved a failure. Schlatter in 1757 served as chaplain of the Royal American regiment in the expedition against Louisburg. During the American Revolution he favored the patriot cause and was imprisoned for refusing to act as chaplain in the British army. He died at Chestnut Hill near Philadelphia in October, 1790. See *Life of Rev. Michael Schlatter* (1857), by Henry Harbaugh.

SCHMUCKER, SAMUEL SIMON (1799–1873), an evangelical theologian born at Hagerstown, Maryland, 28th February, 1799, was the son of John George Schmucker, D.D. (1771–1854), Lutheran pastor of York and Williamsburg, Pennsylvania, who published some works in German. He was ordained in 1820 and became pastor of the Lutheran Church at Newmarket, Virginia. From 1826 he was first president of the Theological Seminary at Gettysburg and professor of didactic theology until 1864 when he became professor emeritus, a position which he held until his death on 26th July, 1873. Besides contributing to theological reviews he compiled the Hymn-Book of the General Synod (1828) and published *Christian Temple* (1824), *Popular Theology* (1834), *Portraiture of Lutheranism* (1840), *Psychology* (1842), *Papal Hierarchy* (1845), *Christian Pulpit* (1846), *Spiritual Worship of God* (1860), and *True History of Christ's Church* (1870), and numerous polemic works on social and religious subjects.

His son SAMUEL MOSHEIM SCHMUCKER (1823–1863), after a short career in the pulpit and at the bar, devoted himself to literature. He published popular biographies of Catherine II. and Nicholas I. of Russia, of J. C. Fremont, Alexander Hamilton, Thomas Jefferson, E. K. Kane, Napoleon III., the four Georges, Henry Clay and Daniel Webster. Among his other publications are *Arctic Explorations* (1856), *History of the Mormons* (1858), *History of all Religions* (1859), *The Modern Jews* (1860), and many popular books.

SCHOOLS IN THE UNITED STATES. The principle of local self-government which characterizes the United States has prohibited all national interference in the development of their school systems. Each State has had absolute freedom to work in its own way the solution of the educational problem; but the stimulating and wholesome rivalry made possible by our scheme of federation, has within a period of two hundred and fifty years produced a state of things in the country at large which permitted an English critic, Bishop Fraser, to say of it, "If not accomplishing all of which it is theoretically capable, if lacking some elements which we justly deem primary, and of which Americans themselves feel and regret the loss, it is still contributing powerfully to the development of a nation of which it is no flattery or exaggeration to say that it is, if not the most highly educated, yet certainly the most generally educated and intelligent people on the earth." Looking then at uniformities in result rather than at diversities in procedure, it may justly be said that we have a national system of public instruction characterized by its own distinctive features.

National features.

Though the National Government has never exercised the right of control over public education, by munificent donations of money and lands it has enabled each individual State and Territory to bestow a perpetual endowment on schools of every grade,—primary, secondary, collegiate, and technical. In the ordinance of 1787 it was affirmed that "religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall be forever encouraged;" and in accordance with this doctrine it was provided that in the States that were to be organized out of the Northwest Territory "there shall be reserved lot No. 16 of every township for the maintenance of public schools." In 1848 this gift of public lands for educational purposes was doubled, so that, with the exception of West Virginia, each State and Territory organized since that date has received two sections of land in each township, the sixteenth and the thirty-sixth, for the endowment of popular education. In addition, by an Act of Congress in 1841, nine millions of acres had been granted to various States for internal improvements, and by express constitutional provision in six of them, California, Iowa, Kansas, Oregon, Nevada, and Wisconsin, about three millions of acres out of this gift were set apart for the support of schools. Again in 1862 an act was passed "donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts." The States entitling themselves to participate in this grant could claim 30,000 acres for each senator and representative in Congress,—a concession amounting to 15,000 square miles. Besides these princely endowments in lands, when in 1835 there was a surplus revenue in the national treasury amounting to over $28,000,000, Congress distributed it among the States for the encouragement of education. Thus it appears that "the total amount by which the general government has aided the several States in education consists of the gift of one hundred and twenty-five thousand square miles of territory, or about one-thirtieth part of the entire national domain, and the gift of nearly thirty millions of dollars." (Thwing.)

In 1867 within the Department of the Interior, Congress organized the NATIONAL BUREAU OF EDUCATION. The act establishing this Bureau defined its functions to be the "collecting of such statistics and facts as shall show the condition and progress of education in the several States and Territories, and the diffusion of such information respecting the organization and management of school-systems and methods of teaching as shall aid the people of the United States in the establishment and maintenance of efficient school-systems and otherwise promote the cause of education." The first Commissioner was Henry Barnard, who organized the work of the Bureau and issued two reports; in

1870 he was succeeded by Mr. John Eaton who carried forward with eminent success, issuing at regular intervals reports of great compass and value, and also a large number of "Circulars of Information" discussing topics of current interest. Mr. Eaton resigned his office in 1885 and was succeeded by Mr. H. H. B. Dawson.

II. CHARACTERISTICS.—The main features of the American system of public instruction are the following: Local Self-Control, Universal Primary Instruction as the Basis of Citizenship, Gratuity, Obligation, Faith in the Higher Education, Equal Educational Advantages for Women, The Professional Education of Teachers, Supervision. Within the limits assigned to this article these topics will now be discussed in their historical aspects and relations.

1. *Local Self-Control.*—The family is the social unit and has supplied the primitive phases of instruction; then there follows the aggregation of neighboring families for carrying on the education of children in common; and finally the State assumes the general direction of public schools. This statement epitomizes the educational history of New England. The first historical notice we have of the endowment of a public school was in 1635, when the people of Boston requested "Brother Plulemon Purmont to become school-master for the teaching and nurturing of children." The same record mentions the grant of thirty acres for the support of the teacher, and by a subsequent resolution a larger amount of land was set apart for "the support of a free school." Similar action was taken by the other towns in the Colonies. Thus the Rev. John Fisk became a teacher in Salem in 1636, and under date of January 1640 we read, "A generall towne meeting,—young Mr. Norris chosen by this assembly to teach schoole." In Charlestown in 1636 "Mr. William Witherell was agreed with to keep a school for a twelvemonth." There was a school in Hartford as early as 1642, and the records of New Haven speak of a school there in 1639–40. In 1640 by vote of the town of Newport Mr. Robert Leuthal was "called to keep a public school for the learning of youth," and there was an appropriation of one hundred acres of land for the endowment of a school "for encouragement of the poorer sort, to train up their youth in learning." The people of Providence took similar action in 1663. All such schools appear to be wholly of local origin and control, although in some cases, as in Dorchester in 1648, the General Court granted land endowments in aid of schools established by voluntary effort. The town of Hadley in 1667 "granted to and for the use of a Grammar School . . . and to be and remain perpetually to and for the use of the said school, the two little meadows, next beyond the brook commonly called the mill brook, and as much upland to be laid to the same as the committee chosen by the town shall in their discretion see meet and needful." Private donations for like uses were also frequent during this period. Thus in 1665 John Clap gave by will a house and land "for the maintenance of the ministry and a school in Dorchester for ever."

This period of purely voluntary effort on the part of communities lasted till 1642, when the General Court of Massachusetts Bay Colony made the following order, the first legislative act in this country looking to the regulation of education: "This Court, taking into consideration the great neglect in many parents and masters in training up their children in learning, in labor and in other employments which may be profitable to the commonwealth, do hereupon order and decree, that in every town the chosen men appointed for managing the prudential affairs of the same shall henceforth be charged with the care of the redress of this evil, so as they shall be liable to be punished or fined for the neglect thereof." Since that date the mode and extent of State control in education have been settled with great uniformity throughout the country and may be stated in general as follows: the State requires each district or township to maintain a school for a specified length of time each year, specifies certain subjects to be taught, prescribes the mode of licensing teachers and supervising their work, determines the mode of electing district officers, distributes the school fund, and demands reports of a prescribed form and kind. The following rights are reserved to communities: the purchase of the school site, building and furnishing of the house, hiring of teachers and fixing their salaries, prescribing rules and regulations and courses of study, determining what sums shall be assessed for school purposes, the election of school officers. The right of local self-control is very jealously guarded, and any movement towards greater centralization is firmly resisted. In all the New England States this fear of centralization has prevented the inspection of teachers and the supervision of schools by county officers. In a few instances the State has presumed to prescribe the books that must be used in the public schools, but this stretch of authority has generally been unfavorably regarded. Mr. Francis Adams speaks of this feature of the United States school-system as follows: "For no reason is the principle of local government more clearly prized than because of the control which it gives the people over the schools. They would be as ready to surrender all municipal powers and privileges as to transfer their management to a sect or to any other private organization."

2. *Universal Primary Instruction.*—In Massachusetts by the act of 1642, already quoted, the selectmen of every town were enjoined in respect to every citizen to take especial account "of their ability to read and understand the principles of religion and the capital laws of the country." Comenius conceived of the public school as an *Officiana Humanitatis*, a manufactory of men; according to the American theory of government the public school is an *Officiana Civium*, a manufactory of citizens. A foreign visitor writes to the *Gentleman's Magazine* as follows: "The school has more to do than to educate the children; it is the mill, so to speak, into which go children of English, Scotch, Irish, German, Russian, Italian and Scandinavian parents, and come out American. Africa contributes its negroes, and now Asia is sending its Chinese. All must learn English, and the result will soon be that the population of the United States will be the most homogeneous of nations." Mr. Francis Adams adds: "It is by means of the free common school that there is an Amerian nation. Without it the nation would long ago have been split up into as many sections as Germany before the Empire. It is not too much to say that it was the teaching of the free school that saved the Union at the time of the civil war."

3. *Gratuity.*—The term "free school" is of frequent occurrence in the early history of New England, and it has often been assumed that the entire cost of the school was met by a public tax. This however is an error, as many quotations might prove. Thus in Salem in 1664 it was "Ordered that a note be published on the next lecture day that such as have children to be kept at school, would bring in their names and what they will give for one whole yeare and, also, that if any poore body hath children or a childe, to be put to schoole and not able to pay for their schooling, that the towne will pay it by a rate." In the Connecticut Records of 1644 and in the Massachusetts Records of 1647 we find it ordered that "every township . . . shall appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children, or by the inhabitants in general by way of supply." The Colonial school then was "free" in the sense that it was open to all children rich and poor; parents who were able paid a tuition, and the tuition of the "poor child" was paid by a town tax. In New Haven in 1657 it

was ordered that one-third of the teacher's salary should be raised by general tax, and the two-thirds paid by the patrons of the school. In 1677 the Connecticut Colony took the following step towards absolute gratuity: "It is also allowed by this court where schools are to be kept in any towne, whether it be a County Towne or other, what shall be necessary to the mayntayning the charge of such schools it shall be raysed upon the inhabitants by way of rate, except any town shall agree upon some other way to rayse the mayntenance of him they shall employ in the aforesayd work." Of all the New England Colonies Connecticut seems to have been the wisest and most progressive in her school legislation. The famous "Free School Act" of New York in 1849 was no great advance on this colonial legislation of 1677. The history of the free school movement cannot be further traced in this place. It must suffice to say that the idea was of Holland birth, that it was embodied in Colonial legislation, and that it was not till 1871 that primary education became absolutely free to every child in the United States.

4. *Obligation.*—It is to be observed that obligation or compulsion in education takes two forms: (1) the State may compel communities to establish schools, and (2) it may compel parents to send their children to school. The second was the first form attempted as in the act of 1642 above quoted, but it had necessarily to give way to the first that there might be schools for the children to attend. The phases of public opinion may be stated in this way: "the maintenance of a Free State is dependent on universal instruction; to this end a sufficient number of schools must be established; and that all children may attend the instruction must be free and parents must accept it for their children." Seemingly it was a fair presumption that wherever there were schools all parents would gladly send their children to them; but as a matter of fact many parents will not accept even gratuitous instruction for their children unless obliged to do it.

In the Colonial Records of New Haven, under date of 25th December 1641, the following passage occurs: "It is ordered thatt a free schoole shall be sett up in this towne, and our pastor, Mr. Davenport, together with the magistrate shall consider what yearly allowance is meete to be given to itt out of the common stock of the towne, and also what rules and orders are meete to be observed in and about the same."

Massachusetts under date of 11th November 1647 "Ordered that every township in this jurisdiction, after the Lord hath increased them to the number of 50 householders, shall then forthwith appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children, or by the inhabitants in general, by way of supply . . . and it is further ordered that when any town shall increase to the number of 100 families or householders, they shall set up a grammar school the master thereof being able to instruct youth so far as they may be fitted for the university [Harvard], provided that if any town neglect the performance hereof above one year that every such town shall pay £5 to the next school till they shall perform this order." This was soon after made a law of the Connecticut Colony, which also adopted in 1650 this law: "Forasmuch as the good education of children is of singular behoof and benefit to any commonwealth, and whereas many parents and masters are too indulgent and neglectful of their duty in that kind:

"It is therefore ordered by this court and authority thereof, that the Select men of every town, in the several precincts and quarters wherein they dwell, shall have a vigilant eye over their brethren and neighbors to see first, that none of them shall suffer so much Barbarism in any of their families as not to endeavor to teach by themselves or others their children and apprentices so much learning as may enable them perfectly to read the English tongue, and knowledge of the capital laws, upon penalty of twenty shillings for each neglect therein."

The same Act required that all children should receive religious instruction, and should be brought up "in some honest and lawful calling, labor, or employment."

This law has been credited to the General Court of Massachusetts Bay in 1642, but it certainly does not appear in the Colonial Records of that date.

It thus appears that as early as 1650 both forms of obligation were recognized by law in New England; under stated conditions primary and grammar schools were ordained in Massachusetts and Connecticut; and in the latter Colony parents were obliged to give their children a prescribed amount of instruction. Previous to the Revolution the creation of schools by legislative enactment was confined to New England; but through the new spirit of fraternity and progress which followed the Federal Union, the example of New England was rapidly followed and the establishment of common schools is now enjoined by the Constitution of every State in the Union. Parental obligation has made much slower progress, but under some form it has legal recognition in the following States and Territories: California. Connecticut, Illinois, Kansas, Maine, Massachusetts, Michigan, Nevada, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, Wisconsin, Arizona, Dakota, District of Columbia, New Mexico, Washington and Wyoming. Up to the present time, these compulsory laws have been imperfectly enforced on account of the difficulty of applying them to those obscure and migratory families and fragments of families which are indifferent to character, the children of which are not suitable associates for the average pupils of the public schools and also require a different discipline. A remedy however has begun to be sought in a system of "truant" officers and schools.

5. *Faith in the Higher Education.*—From careful investigations made by Professor Dexter of New Haven, it appears that out of the 21,000 persons who had landed in New England prior to 1640, there were 100 graduates of Oxford and Cambridge. Partly from old associations, and probably more from a desire to establish the new Colony upon an enduring basis of religion and learning, the planting of a college was one of the first public acts of the General Court. Under date of 28th October 1636 there is this record: "The Court agreed to give £400 towards a schoole or college, whereof £200 to be paid the next yeare and £200 when the work is finished, and the next Court to appoint wheare and wt buildings." The next year "Newtowne," now Cambridge, was selected for the site, and on 13th March 1639 it was "ordered that the colledge agreed upon formerly to be built at Cambridge shall be called Harvard Colledge." The name thus given was in honor of John Harvard who in 1638 left to it half of his property (£779, 17*s.* 2*d.*) and his whole library of about 300 volumes. Until 1866 it was essentially a State institution, up to 1814 it had received aid from the Legislature of Massachusetts to the amount of $215,797.

As early as 1647, mainly through the efforts of Rev. John Davenport, plans were inaugurated for establishing a college in New Haven, though it was not till 1701 that Yale College was actually founded. The college of William and Mary was founded in 1693. "Of the colleges now existing in the United States," says Mr. Thwing, "two were founded in the seventeenth century, and twenty-two in the eighteenth. In the present century their multiplication has been rapid. Three were organized in the first decade, 1 in the second, 12 in the third, 25 in the fourth, 31 in the fifth, 71 in the sixth, 75 in the seventh, and 48 (estimated) in the eighth." The report of the Commissioner of Education for 1883–4 gives a list of 370 colleges and universities then in operation in the United

States. From this report it appears that the aggregate value of grounds, buildings, and apparatus was $45,064,000; the total amount of productive funds, $41,796,000; the total income from productive funds, $3,037,000; the total receipts from tuition fees, $2,069,000; the whole number of volumes in libraries, 2,412,000; the whole number of students enrolled, 32,690; the whole number of degrees conferred 6,514. It is worthy of notice that though legislative aid was given to Harvard College in 1636, it was not till eleven years after that the General Court took active measures for establishing primary and grammar schools. The free grammar school of colonial times was the parent of the later academy and of the modern high school. An educated ministry was felt to be a first public necessity, and hence provision for securing it engaged the earliest efforts of the colonists, but soon the needed supply of students for the college from children of American birth could be secured only through schools of preliminary instruction. After the Revolution these grammar schools were succeeded by academies which were for the most part private institutions. The York Grammar School of Maine, Phillips Academy at Andover, and Phillips Exeter Academy, were fine types of these improved intermediate schools. The growth of academies culminated about the year 1840. At this period there occurred what may be called a public school revival, one outcome of which was the modern high school or free academy, which seems to have had its freest development in the West where it has been organically connected with the State university. In a recent address Mr. Matthew Arnold said, "What is most to be desired for the common school is an *organic connection* . . . with higher instruction,—a vivifying relation and contact with it. But for this purpose public instruction must be organized as one whole. We have not yet so organized it in England, and I do not think that in America you have yet done so either, although in your State governments you have the very machinery best suited to the purpose." In at least two States, Michigan and Minnesota, the system so justly regarded by Mr. Arnold as an ideal has been made an actual fact.

6. *Equal Educational Advantages for Women.*—Until the last quarter of the eighteenth century there was no public movement towards the higher education of girls. They were educated in the common schools along with boys, where they learned the instrumental arts of reading, spelling and writing, and their subsequent education was domestic; they were taught the usual household industries, such as carding, weaving, spinning, and sewing and were systematically instructed in the Scriptures. The proposition to teach girls science was deemed absurd. Select schools for young women were beginning to come into fashion. Thus we read: "1773 April 20 [Salem], Mr. Norris advertises to commence a school for young ladies, beginning at the hours of 11 and 5 o'clock, where they will learn to write and cipher;" "27th, Elizabeth Gaudin opened a select school yesterday in Derby street to instruct young ladies in plain sewing, making tent and Irish stitch." The Moravian school at Bethlehem, Pa., and Medford Academy, Mass., opened in 1789, were among the first institutions offering higher instruction to women. Oberlin College in 1841 set the example of giving college degrees to women, and the greater number of collegiate institutions organized since that date are open to men and women alike. In the East the higher education of women is given for the most part in special institutions, such as Vassar, Smith and Wellesly Colleges, though women are admitted to Dickinson and Middlebury Colleges, and to Cornell University; but in the West the State Universities make no distinction as to sex in the admission and graduation of students. In 1874 the number of special institutions in the United States for the higher education of women was 209; the number of instructors 2285; and the number of students 23,445. In 1884 the number of schools was 236, of instructors 2989, of students, 30,587. The number of degrees conferred by these institutions in 1844 was 844.

7. *The Professional Education of Teachers.*—There have been three progressive phases of opinion with respect to fitness for teaching. The primitive phase, originating in a period when the lettered few were contrasted with the unlettered many, identified scholarship and teaching ability,—any one who was learned could teach. When all the world had learned to read, the scholars who could teach successfully and those who could not were contrasted, and the difference in result was ascribed to *method*. The third phase of opinion superadds science or philosophy to general scholarship and method. The idea of *method* underlies the organization of the normal school, of which the first in the United States was established in 1839 at Lexington, Mass. From that date to 1850, only seven of them were founded; from 1850 to 1860 twelve; from 1860 to 1870 fifty-two; and from 1870 to 1875, sixty-six. The number of normal schools, public and private, tabulated in the report of the Commissioner of Education for 1884 is 255. With respect to their management and control there are three sorts, State, city and private. State normal schools are very unevenly distributed. Thus New York has 9, Pennsylvania 10, Massachusetts 6, Wisconsin 5, Minnesota 3, Illinois 2, Indiana and Michigan 1 each, Ohio none; while the South is relatively poorly provided with them. The somewhat special wants of larger cities have led them to organize normal schools to supply the needs of their vast graded and connected systems. The third class of these schools prevails chiefly in the West. They are business enterprises and their general effect on professional excellence is unwholesome. A training or experimental school is generally thought to be a necessary adjunct to a normal school, "as indispensable to the teacher as the hospital and the *clinique* to the young and inexperienced physician." It can scarcely be doubted, however, that dwelling so strongly on *method* produces a tendency towards mechanism in teaching and away from freedom, versatility and culture. For after all the prime quality necessary for excellence in teaching is a generous inspiring scholarship. The field of normal school influence is determined with almost fatal exactness by the scholarship which it gives,—its upper limit is somewhat within the high school standard, since in academic instruction it is a secondary school.

The third phase of opinion has found expression in the establishment of chairs of pedagogics in universities. The superintendence of public schools and the instruction given in high schools almost necessarily fall into the hands of men and women of liberal education; and the professional need of such persons is a knowledge of educational doctrine. Besides, on the ground of intrinsic merit, the study of the art of education has as valid a claim to university recognition as four-fifths of the subjects included in the traditional curriculum. Cornell and the Johns Hopkins Universities, as well as those of Indiana, Iowa, Michigan and Wisconsin, now offer courses in pedagogics. That all teachers should have a professional training is generally accepted as fundamental in school administration; but the present extension of the normal system falls far short of capacity for this ideal. In the States where it is completest only a small part of the teaching force can be educated by it, and this fact has led to the establishment of the auxiliary Teachers' Institutes. Their formation began about the year 1840 and has had a rapid extension throughout the country. At the present moment the Institute is being supplemented by the Teachers' Reading Circle.

8. *Supervision.*—During the Colonial period there was neither official inspection of scholars nor examination of teachers, but these duties were left to the minister in his parish, especially on those public occasions when visitors were invited to be present. No

one could have charge of a school unless he were known to be of exemplary character and had received the approbation and permission of the Selectmen. To teach a grammar school it was necessary to obtain a certificate granted by the resident minister and two of his neighboring clerical brethren, or at least by two of the three. New York was the first State to establish a system of State supervision, Gideon Hawley having been elected superintendent of public instruction in 1813. Ohio and Massachusetts in 1837 followed this precedent. In the latter State there was created a Board of Education of ten members empowered to appoint a secretary who should exercise the functions of State superintendent. The first secretary of this Board was Horace Mann who has been appropriately called the educational missionary of the United States. In 1838 a State Board of Education was organized in Connecticut and Henry Barnard was its first secretary. From this period the system of State supervision rapidly extended until, under some form, it is now universal in this country. In every case however the power of this official is very limited. He certainly should be much less than an autocrat, but he ought to be something more than a clerk. Between local inspection of the primitive type and the general oversight of the State official there has been widely established a system of county inspection, which promises to be the permanent adjustment of that element in administration which is the turning point of success. Supervision of the highest type however is found in the larger cities, and the best educational talent is engaged in their service. City school supervision has its ablest exponent in the late John D. Philbrick who gave to Boston the model schools of the United States.

III. Education in the South.—The first step towards the establishment of schools in the English Colonies of America was taken by the Virginia Company. In a letter written from London to the authorities at Jamestown, 18th November 1618, it is stated that, "Whereas, by special grant and license from his majesty, a general contribution over this realm hath been made for the building and planting of a college for the training up of the children of those infidels in true religion, moral virtue and civility, and for other godliness . . . we . . . hereby ratify and confirm and ordain that a convenient place be chosen and set out for the planting of a university at the said Henrico in time to come." These collections amounted to £2043, 2.s 12½d. In 1619 this sum was increased by £550 from an unknown source, and in the next year Mr. Nicholas Farrar left a will bequeathing £300 towards the converting of infidels' children in Virginia. This plan was defeated by the Indian massacres which soon followed, and it was not till 1693 that the pious wish of the Virginia Company was realized by the establishment of the second seat of learning on the American continent, that of William and Mary.

The Indians.

No vigorous movement was made towards the establishment of a complete system of public instruction till the year 1777 when Thomas Jefferson drafted his famous bill "For the more General Diffusion of Knowledge by means of Common Schools and Grammar Schools." By the terms of this bill each county was to be divided into "Hundreds," and for each Hundred there was to be established an elementary school in which all free children could receive instruction *gratis* for three years, and for any longer period at the expense of their parents. Then there was to be a grammar school in each of the twenty districts into which the State was to be divided. This bill received no legislative attention till 1796, and though it became a law, its provisions were practically defeated because they were made optional rather than mandatory.

The University of Virginia however was of Jefferson's creation. It was opened in 1825 and presented an essentially new type of administration. "In all other American colleges then existing the controlling influence was wielded by one of the learned profession; and all students were compelled to pursue a course of studies orignally prescribed by that one profession for its own perpetuation. In the University of Virginia . . . all the professions are upon an equality, and every student is free to choose what knowledge he will acquire and what neglect. It is a secularized university."

North Carolina has the distinction of being the first State to make a constitutional provision for education, but no general establishment of schools resulted from this action.

Up to the time of the Civil War the public school system had not taken root in the South. The typical Southern colonist was a feudal lord living in the centre of a vast estate and commanding the services of numerous dependents. The scattered population of landowners could not easily associate for maintaining a school, and the servile class were thought to be more docile if left untaught. Senator Joseph E. Brown has stated the case as follows: "Under an old system of society we looked more to the education of the ruling classes than we did to the education of the whole mass. . . . We did not, as they did in New England, furnish the money to establish systems of public schools where all the children could be educated, but we educated our children through the means of private schools, where only the wealthier classes and those who were well-to-do could send their children. Consequently there was a larger number of illiterate persons in our society than there was in the society of New England or any other State that had a properly endorsed public school system."

The census of 1880 shows that thirteen per cent. of the population of the United States over ten years of age were unable to read; that in the States of Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Virginia, thirty-three per cent. of the population over ten years of age were illiterate; that in the States of Iowa, Kansas, Maine, Michigan, Minnesota, Nebraska, Ohio, and Wisconsin, the illiteracy did not exceed four per cent.

Since the war the South has made heroic efforts to establish and support a system of public schools, and though struggling with almost unexampled difficulties an unmistakable progress has been made. The people willingly burden themselves with taxation for educational purposes, and are bent on removing the disgrace and danger of illiteracy. The educational renaissance in the South has been fostered by the munificent endowment of George Peabody who, in the years 1867 and 1869, gave two millions of dollars "for the encouragement and promotion of intellectual, moral and industrial education among the young of the more destitute portions of the southern and southwestern States of the Union." The disbursements from this fund from 1868 to 1884 inclusive in twelve southern States amounted to $1,476,579. In 1882 51 per cent. of the school population in the recent slave States were enrolled in the public schools; and in 1884 this percentage had increased to 55.

IV. Present Tendencies.—In the United States teaching assumes year by year more of a professional character. There is a growing number of scholarly men and women who adopt it as a vocation; the normal schools are diffusing *esprit de corps*, and there is a pronounced movement towards the development of a science of education and an art of teaching. The prevailing spirit is no doubt empirical, but the men whose influence is most rapidly extending are those of philosophic spirit.

The vague and somewhat pretentious term "new education," indicates a reaction against formalism and routine. This movement is wholesome so far as it excites thought and emancipates from the purely mechanical; but it is mischievous in the degree to which it is accepted as a revolution.

The *kindergarten*, with its mystic symbolism and exalted faith in the instincts of childhood, is an educational gospel preached with all the fervor of real apostleship. As the kindergarten is based on the conception of play, or of pleasurable and voluntary activity, while the primary school is based on the conception of work or, if need be, of constrained activity, there is an incompatibility which can be overcome only by a modification of both systems. It is probable that the outcome will be a diffusion of joyousness and freedom over the methods of the primary school and the disappearance of the distinctive kindergarten.

Manual Training is still experimental. It doubtless exhibits a reaction against literary and abstract teaching. Its earlier conception was that the school should equip its pupils with a trade as a means of earning a livelihood; but this purpose is now generally disavowed, and the claim of discipline has now been set up,—in a complete education the hand and the brain are coördinate agents. It is probable that this idea is also destined to absorption into the State system so that it will embrace a goodly proportion of concrete and perhaps technical training.

This phenomenon of absorption is exhibited in the fate of *Object Lessons* which method was epidemic twenty-five years ago, and also in the history of the *Monitorial System*, of which De Witt Clinton, in 1809, said: "I confess that I recognize in Lancaster, the benefactor of the human race. I consider his system as creating a new era in education—as a blessing sent down from Heaven to redeem the poor and distressed of this world from the power and domination of ignorance." This once famous method has long been an educational antiquity. History presents many like phenomena of brilliant prediction and rapid attenuation, which though lost to the general memory have doubtless contributed something to the progress of the educational art.

Professional activity is displayed through two national associations, the American Institute of Instruction organized in 1830, and the National Teachers' Association organized in 1856.

Within the latter has been organized the National Council of Education, the purpose of which is the patient discussion of fundamental questions in educational philosophy and administration. Besides these national associations each State has its own yearly convention of Teachers. (W. H. P.)

For specific statistical details see the paragraphs on Education in the articles on the several States of the Union given in this Encyclopædia.

SCHUYLER, Philip (1733–1804). The first Schuyler to appear in America was Philip Pietersen von Schuyler who came from Holland in 1650, settled at Albany and died in 1684. Two of his sons were Pieter and John. The former was the first mayor of Albany after its incorporation in 1683, and again served from 1686 to 1694. With the Indians of the Iroquois confederacy he had unbounded influence, and with four chiefs, representatives of four nations, he visited England to promote an alliance between the British and the red men for the invasion of Canada. He had previously (1691) led an expedition as far as Laprairie to avenge the burning of Schenectady, and during it had destroyed nearly as many foemen as he had followers. As president of the Executive Council he became acting governor of the province in 1719, during an interregnum. He died in 1730 leaving a son Peter (*c.* 1710–1764) who served in the French and Indian war, was a French prisoner of war, removed to Newark where he acquired a large estate, and died there 17th November.

Philip, the distinguished general of the revolutionary war, was grandson of the John Schuyler mentioned above who maintained the traditional family ascendency over the Indians, for whom he was provincial commissioner for 30 years, and who died in 1747. He inherited all his father's estate, which he generously shared with his brothers and sisters, and a fourth of that of an uncle Philip who was killed in his own house at Saratoga in 1745 by a French officer. As a captain of colonial troops he served at Fort Edward in 1755, and the same year he married Catherine Van Rensselaer. He was commissary to Colonel Bradstreet's command at Oswego in 1756 and to the troops engaged in the invasion of Canada in 1758. On a voyage to England in 1761 he was captured by a French privateer, but rescued on the high seas by an English frigate. In the disputes between the colonies of New York and of New England as to their respective boundaries, Schuyler's occasional employment laid the foundation of his later unpopularity in the latter. In the legislature of 1768 Colonel Schuyler, as he then was, maintained colonial rights against the British Parliament. He was a delegate to the Continental Congress in 1775, and was appointed by it jointly with Washington to frame the army regulations. In June of that year he was commissioned major-general. Assigned to the command of the Northern Army he began preparations for the invasion of Canada, but on account of his ill-health the execution of the plan devolved on General Richard Montgomery.

The command of the unfortunate army in Canada passed from one officer to another until June 1776, when it was conferred on Horatio Gates, whom Congress had raised for this duty to the rank of major-general, directing him not to supersede but to coöperate with Schuyler. The misunderstandings and jealousies growing out of this divided command were referred by both generals to Congress, which in March 1777 virtually gave the authority to Gates. General Schuyler then appeared in Congress as a delegate from New York, and his presence there so conciliated its members that he was directed to resume command of the Northern Army. The evacuation of Ticonderoga swiftly followed (see St. Clair), and an outcry of alarm arose in New England, which was speedily re-echoed in Congress, and Schuyler was superseded. Meanwhile he redoubled his exertions to obstruct the progress of Burgoyne, and when Gates took command on the 19th of August the success of the American arms was already assured. Schuyler remained with the army as a voluntary aide during the battles of Bemis Height and Stillwater. His conduct having been approved by Washington and by Congress he resigned from the army in 1779. He was State senator in 1780 and State surveyor in 1782, and he liberally used his large wealth to sustain the credit of the Federal Government at the close of the war. He was chosen one of the first senators from New York under the United States Constitution of 1789, obtaining the short term of two years, and was re-elected in 1797 but was prevented by ill-health from serving. He died at Albany November 18, 1804.

General Schuyler was a sufferer for thirty years from rheumatic gout; he was jealous of his dignity, but his patriotism was unswerving. His ability as an organizer and quartermaster was excellent, but his military capacity otherwise was never thoroughly tested. Alexander Hamilton was his son-in-law. *The Life and Times of Philip Schuyler*, by Benson J. Lossing, was published in 1860–2 and an enlarged edition in 1872. (J. P. L.)

SCHWEINITZ, Lewis David von (1780–1834), an American botanist, was born at Bethlehem, Pennsylvania, 13th February 1780. He was educated in Germany where he published a Latin work on Lusatian fungi, indicating the direction his maturer work was to take, which was to give precision and system to the study of cryptogamous plants in America. He returned in 1812 to become a Moravian minister at Salem, N. C. He published a catalogue of the fungi of North Carolina (1818), and afterwards of North America (1832). He went back to his native town in 1821, and died there 8th February 1834, having in the meantime published several valuable botanical treatises on hepatic mosses and the genera *Viola* and *Carex*.

His son EDMUND ALEXANDER DE SCHWEINITZ, born in 1825, presiding bishop of the Moravian Church in America, has published a *Life of Zeisberger* (2 vols. 1870), the *History of the Unitas Fratrum* (1884) and other works on Moravian history and polity.

SCOTT, JOHN MORIN (1730–1784), an American patriot descended from Sir John Scott of Ancram Scotland who died in 1712, was born in New York city in 1730, graduated at Yale College in 1746 and became a lawyer noted for his wit and eloquence. He was an early advocate of American independence and one of the founders of "The Sons of Liberty." In 1775 he was a member of Congress, in 1776 was appointed brigadier-general of the State militia and took part in the battle of Long Island. In 1777 he was secretary of the State of New York, and in 1780 was elected to Congress. He died September 14th, 1784.

His grandson of the same name (1789–1858), was a member of the Pennsylvania Constitutional Convention in 1837, and Mayor of Philadelphia 1841–4.

SCOTT, THOMAS ARNOLD (1824–1881). This distinguished organizer of railway administration in America, a native of Loudon, Franklin county, Pennsylvania, was removed from school at ten years of age to employment in a country store. From superintending the State tolls at Columbia he passed in 1850 to the service of the Pennsylvania Railroad Company, over the eastern division of which he was placed in charge. His executive skill procured his advancement to the position of vice-president of the company nine years later. On the death of J. Edgar Thompson in 1874, he succeeded him in the presidency and retained that position until failing health incapacitated him for its duties (1880). He died at his country seat, Lansdowne near Philadelphia, 24th May of the next year.

When the civil war broke out Mr. Scott accepted a position on the staff of Governor Andrew G. Curtin of Pennsylvania with rank as lieutenant-colonel, and effectively promoted the organization of the State contingent of troops for the Federal army. During the same year Mr. Cameron called Colonel Scott to Washington as assistant secretary of war, placing in his charge the railways in the military possession of the Government, and in the restoration of broken communications, the transportation of supplies, and the rapid concentration of troops at exposed points his services were of signal ability. To him the credit is also due of organizing and presiding over the Pennsylvania Company, an agency of the railway company of the same name for extending its control over the leased and acquired lines west of Pittsburgh which enter into its trunk line system from the great lakes and the Mississippi river to the Atlantic. Colonel Scott was for a time president of the Union Pacific Railroad, and was the chief promoter of the construction of the Texas Pacific Railroad until his death. The railway service under his more immediate administration rapidly advanced to the highest mechanical efficiency and the promptest and safest transportation that had then been achieved in America.

SCUDDER, JOHN (1793–1855), an American missionary, was born at New Brunswick, New Jersey, 3d September 1793. He graduated at Princeton College in 1811 and studied medicine at the New York College of Physicians and Surgeons in 1815. He abandoned an extensive medical practice to take orders in the Dutch Reformed Church and to go as a missionary to India, whither he was sent by the American Board of Commissioners of Foreign Missions in 1820. He labored for 19 years in Ceylon where, besides preaching and conducting schools, he established a large hospital. In 1839 he was transferred to Madras and in 1842 returned to America where he did much to stimulate missionary effort. He returned to his work in India in 1846, and subsequently went to the Cape of Good Hope for his health where he died January 13, 1855. His publications relate to the subject to which he dedicated his life. Among them are *The Redeemer's Last Command*, *Tales about the Heathen*, *Letters from the East* (1833).

His children, eight sons and two daughters, all gave themselves to missionary work.

SEABURY, SAMUEL (1729–1796), the first bishop of the Protestant Episcopal Church, was born at Groton Connecticut 30th November 1729. His father, a man of Puritan and Huguenot lineage, after some years of service as the Congregational minister of Groton went to England to take orders in the Established Church and returned to Connecticut as a missionary of the Society for the Propagation of the Gospel. Samuel graduated at Yale, studied medicine at Edinburgh, was ordained deacon and priest in London in 1753 and passed twenty-two years in pastoral duty at New Brunswick N. J., at Jamaica Long Island and at Westchester N. Y. He was zealous as well to secure an Episcopate for the American colonies as to stem the tide of disloyalty set in motion by the measures of the British Parliament. In 1775 he was imprisoned as the suspected author of some Tory pamphlets, but was released for want of proof. On the commencement of hostilities he sought refuge in New York and in 1778 became chaplain of the Loyal American Regiment. To the end of his life his half pay of £50 coming from the British government formed an important part of his support.

Many of the Church of England clergy remaining in the United States, while accepting with Seabury the civil changes consequent upon the war for independence, also shared his desire to secure an American Episcopate which had now become essential to the permanence of their church polity, but some in the Southern and Middle States were inclined to forego Episcopal government in order to secure what they esteemed higher religious interests. Ten of those residing in Connecticut met secretly in March 1783, and resolved to send one of their number to ask consecration at the hands of English prelates. Seabury as their chosen representative arrived in London in July 1783, but the complications of the Established Church with the government prevented the accomplishment of his mission in England and he turned as a last resource to the non-juring bishops of Scotland, the validity of whose orders was unquestioned. Even there difficulties were encountered, but at last on 14th November 1784, in the upper story of Bishop Skinner's residence in Aberdeen, Seabury was duly consecrated. The act cost him the loss of favor in England and the Society which he had served for thirty years struck him off its list of missionaries. He returned to Connecticut in June 1785, and entered earnestly upon diocesan work joining with it pastoral duty at New London. In 1786 an act of Parliament authorized the English bishops to consecrate duly chosen representatives of the American Church without imposing upon them the usual oath of allegiance to the British crown, and in February 1787 Bishops White and Provoost received Episcopal orders in Lambeth Palace. Two years later the diocese of Connecticut was received into union with the General Convention at Philadelphia. In the revision of the English Prayerbook to suit the new circumstances of the American Church Bishop Seabury was stanchly conservative. The chief change introduced by him was the introduction of the Invocation of the Holy Ghost into the Communion office, in which he followed the Scotch book. Two volumes of his sermons issued from the press during his life, to which a posthumous volume was added. He died at New London 25th February 1796. Bishop Seabury was a High Churchman of a bold and resolute spirit, noble in motive and dignified in manner, yet with a strong sense of humor.

SAMUEL SEABURY (1801–1872), grandson of the preceding, was born 9th June 1801 and died 10th October 1872. He was ordained deacon in the Protestant Episcopal Church in 1826 and priest two years

later. After a number of years passed in teaching and in missionary work on Long Island he removed in 1834 to New York to edit *The Churchman*. In this journal he maintained with vigor and success the principles which his grandfather advocated. It was influential in the controversy provoked by the Tractarian movement. In 1849 Dr. Seabury became rector of the church of the Annunciation in New York city, and in 1863 professor of Biblical Learning in the General Theological Seminary. His principal publication is *The Continuity of the Church of England in the Sixteenth Century* (1853.)

SEALSFIELD, Charles (1793–1864), a German author whose real name was Carl Postel, was born at Poppitz, Moravia, 3d March 1793. At an early age he had entered a religious order, but in 1822 escaped from the convent in Prague and went to Switzerland, from which event he bore his assumed name, and his identity was only revealed after his death by Friedrich Hemmann who was the sole repository of his secret. Sealsfield emigrated to America, wandered from New York to Mexico and thence back through New Orleans to Philadelphia. Here he published *Tokeah, or the White Rose* (1828) his first novel. He was afterwards a journalist in London and Paris, and in 1832 he returned to Switzerland. During a later visit to the United States he was naturalized. He published a large number of books in both English and German. Among the former were *Flirtation in America* (1842), *The Cabin Book, or Texan Sketches* (1844), *Scenes and Adventures in Central America* (1852), *The Viceroy and the Aristocracy* a vivid and clever tale of Mexican life. Sealsfield acquired wealth and some literary reputation, but dread lest his secret should be discovered caused him to adopt habits of reserve and mystification so that his neighbors in Switzerland believed his fortune had been derived from the slave trade and that he suffered from remorse. He died at Soleure Switzerland, 26th May 1864. A monument to his memory was erected in 1875 at his birthplace.

SEARS, Barnas (1802–1880), an American educator, was born at Sandisfield Massachusetts, 19th November 1802. He taught school in his youth, was graduated in letters at Brown University in 1825, and in theology at the Newton Seminary.

After a brief pastorate in Hartford he accepted a professorship in the Literary Institute at Hamilton N. Y. which has since grown into Madison University. For two years he studied at Halle, Leipsic and Berlin in Germany, in which country he formed a Baptist church by secretly baptizing Rev. J. G. Oncken and others at Hamburg. This organization forbidden by law and officially repressed has since grown to 125 churches with 25,000 members. A year after his return to Hamilton in 1835 Sears was made professor in the Newton Theological Seminary, over which institution he presided for nine years. He was editor of the *Christian Review*, as at a later stage of his career he was of the *Bibliotheca Sacra*. Another field of activity was opened to him in the Massachusetts Board of Education for which he was admirably fitted. In 1848 he succeeded Horace Mann as Secretary of the Board and carried out the plans inaugurated by that eminent educator for the improvement of common schools. In 1855 Dr. Sears succeeded Dr. Francis Wayland as President of Brown University. After nearly twelve years of successful administration here he was in February 1867 made executive agent of the large fund established by the American banker, George Peabody of London, for the promotion of education in the Southern States, and to this trust his remaining days were devoted, for which purpose he removed to Staunton Virginia, and the interests of education in the South prostrated by the civil war were revived by his timely and judicious administration. Dr. Sears died at Saratoga Springs N. Y., 6th July 1880. He had received the degree of D.D. from Harvard College in 1841, and that of LL.D. from Yale College in 1862. Besides some text-books for the study of German and Latin and valuable educational reports, Dr. Sears published a brief *Life of Luther* (1850), which is one of the best popular biographies of that reformer extant.

SEARS, Edmund Hamilton (1810–1876), an American clergyman, was born at Sandisfield Massachusetts, 6th April 1810. He graduated at Union College in 1834 and after a trial of law studied theology at Cambridge. In 1839 he was installed at Wayland Massachusetts and in the next year at Lancaster, but returned to Wayland in 1848 and remained till 1865. His last charge was at Weston Massachusetts, where he died 14th January 1876. From 1859 to 1870 he was associate editor of the *Religious Magazine*. While connected with the Unitarian body his views were rather mystical and inclined to those of Swedenborg. The partial failure of his voice led him to increasing reliance upon his pen and his books were eagerly read by a wide circle. His writings include *Regeneration* (1853), *Pictures of the Olden Time* (1857), *Athanasia* (1858), *The Fourth Gospel the Heart of Christ* (1872), *Sermons and Songs of the Christian Life* (1874), and *Christian Lyrics*. His Christmas hymns have found wide acceptance.

SEATON, William Winston (1785–1866), a journalist of Virginia birth, began the practice of his profession at the age of eighteen at Petersburg in his native state and at twenty-two removed to North Carolina where he was associated with newspapers at Halifax and at Raleigh. In the latter city he connected himself both by business and by marriage to his daughter with Joseph Gales (1760–1841) an English journalist who for political reasons emigrated to Philadelphia in 1793 and there began publishing in the *Gazetteer* stenographic reports of the proceedings in Congress. Six years later Gales removed to North Carolina and established the *Raleigh Register*, but his son of the same name (1786–1860) settled in Washington, D. C., in connection with a tri-weekly newspaper called the *National Intelligencer*, which was the continuation of his father's *Gazetteer* and which had followed the removal of Congress in 1800 to that city. Seaton on the invitation of his brother-in-law joined him in the publication of the *Intelligencer* (1812), which became a daily the next year and continued in existence until 1869, devoting itself to the interest of the Whig party throughout its history. Out of this journalistic association and the custom of the partners to divide the reporting of the two houses of Congress between them grew Seaton's contributions to the history of his country. They are the *Annals of Congress* which embrace the proceedings of that body from 1798 to 1824, and the *Register of Debates in Congress from 1824 to 1837*. To these should be added 21 volumes of *American State Papers* selected from the collection of the two brothers. Seaton was Mayor of Washington from 1840 to 1852. His daughter Josephine has published (Boston 1871) an animated and pleasant sketch of her father's life and correspondence.

SEDGWICK, a family of note in the history of New England descended from Robert Sedgwick (*c.* 1590–1656) who was a prominent Puritan merchant of London, but removed to Massachusetts in 1635. He was one of the first settlers of Charlestown which he often represented in the General Court of the colony. Enterprising in trade he also took part in establishing the first iron furnace in the country in 1643. He assisted in organizing the Ancient and Honorable Artillery Company in 1638, and, becoming commander of all the forces of the colony under the Commonwealth of Cromwell, was sent by him in 1654 across the Penobscot river to expel the French from whom he took several forts. The next year he was appointed one of a commission to govern Jamaica, where he died 24th May 1656. Carlyle calls him "a very brave, zealous and pious man."

Theodore Sedgwick (1746–1813), noted successively in a political and judicial capacity, was born at

Hartford Connecticut, in May 1746. After leaving Yale College he began the study of divinity, but soon abandoned it for the law which he practiced in Berkshire county. He served on the staff of General John Thomas in the disastrous attempt of 1776 to reinforce Arnold's siege of Quebec, and ardently supported the cause of American independence. After two years service (1785–6) in the Continental Congress he returned to Stockbridge, Massachusetts, which town he represented in the General Court, in the lower house of which he was Speaker in 1788. Soon after the adoption of the Massachusetts Constitution of 1780, Sedgwick, as counsel for a negro woman who had fled from her master, obtained a decision which practically abolished slavery in that State—a decision subsequently reinforced by his own *dictum* from the supreme bench that property in man was illegal. After advocating in the State Convention the ratification of the Federal Constitution Sedgwick became one of the most prominent of the New England Federalists. Under that Constitution he spent seven years (1789–96) in the national House of Representatives, and then three in the Senate. From 1802 till his death at Boston, 24th January 1813, he was judge of the Supreme Court of Massachusetts, having long been regarded "as among the ablest men of the State."

THEODORE SEDGWICK (1780–1839) eldest son of the preceding, was noted as a lawyer and publicist. Born at Sheffield Massachusetts, 31st December 1780, he was graduated at Yale College, and being admitted to the bar in 1801 settled at Albany, N. Y. After twenty years' practice failing health led him to make the family residence at Stockbridge Massachusetts his permanent home. Entering the legislature, where he was a ready advocate of Democratic measures, he induced that body to sanction in 1827 the project of a railroad from Boston to Albany, then regarded as visionary. Free trade, temperance and the anti-slavery cause in turn engaged his support. He published a desultory but agreeable book entitled *Public and Private Economy* (2 vols. 1838). His death by apoplexy occurred 7th November 1839 at Pittsfield, Massachusetts.

His wife, SUSAN RIDLEY SEDGWICK (*c.* 1789–1867), was a granddaughter of Gov. William Livingston of New Jersey. She wrote a number of books chiefly for the young. They are *The Morals of Pleasure* (1829), *Allen Prescott* (1835), *Alida, or Town and Country* (1844), *Louisa and her Cousins* and *Walter Thornley* (1859).

More noted as an author was his sister CATHARINE MARIA SEDGWICK (1789–1867). In 1822 when writing what was intended to be a religious tract she found it expand into *A New England Tale*, which on publication attained instant success. *Redwood* published in 1824 was soon translated into several European languages. The merit of this story and of *Hope Leslie* (1827) her best work, was their vivid presentation of the peculiar features of New England country life and scenery. To these she added *Clarence* (1830) and *Linwood* (1835) a tale of the Revolution. Many moral tales and books for children were the products of her pen and enjoyed a wide celebrity. To Sparks's *American Biography* she contributed a *Memoir of Lucretia M. Davidson*, one of two precocious poetical sisters of Plattsburg, N. Y. Of her earlier works a select edition in 3 volumes was published in 1857, but she still continued to add to their number, the last being *Letters to my Pupils* (1862). She died at Roxbury, Massachusetts, 31st July 1867. Her *Life and Letters* (1871) edited by Mary E. Dewey shows the same cheerful, home-loving disposition which breathes from all her books.

A son of Theodore and Susan R. Sedgwick who bore his father's and grandfather's name attained eminence as a jurist. Born at Albany 27th January 1811, graduated at Columbia College, admitted to the bar in 1833, he was the next year attached to the United States legation in Paris while his relative, Edward Livingston, was minister to France. For seventeen years he assiduously practiced law in New York with a high and lucrative reputation, returning to it in the last year of his life as United States attorney for the Southern district of his native State. His *Treatise on the Measure of Damages* (1847), a discussion of the principles governing compensatory awards in suits at law, was long a standard authority. He also published a *Treatise on the Interpretation of Statutory and Constitutional Law* (1857) which De Tocqueville commended. He died at Stockbridge, Massachusetts, 8th December 1859. Besides enriching a number of periodicals with legal and political essays, he published a Memoir of his ancestor Governor Livingston (1833), and edited the *Political Writings* of his friend William Leggett, a brilliant young journalist and critic of New York.

SEDGWICK, JOHN (1813–1864). This skilful soldier was one of the bravest and best beloved commanders in the army of the Potomac. Born in Cornwall, Connecticut (13th September), at twenty-four years of age he was graduated at West Point and sent into the Seminole war as an artillery lieutenant. The war with Mexico withdrew Sedgwick from garrison duty and assigned him to Scott's army of invasion, in the battles of which from Vera Cruz to the capture of Chapultepec he participated, winning promotion as the guerdon of his soldierly qualities. A few years subsequently he was transferred to the cavalry service, in which he held the rank of lieutenant-colonel, when the opening of the civil war in 1861 brought him rapid advancement. On 31st August he was commissioned brigadier-general in the volunteer army and given a command on the upper Potomac, whence General McClellan called him to lead a division of Sumner's army-corps. In the Peninsular campaign which followed he led his division until the battle of Frazier's Farm (30th June), where he was wounded in the attempt to prevent the union of Stonewall Jackson and Longstreet on the south side of White Oak Swamp. Thirty days previously he had effected the passage of the overflown Chickahominy at the grapevine bridge and appeared at Fair Oaks Station in time by a dashing charge to turn the fortunes of McClellan's sorely shaken right. His services in this campaign were rewarded with a major-general's commission (4th July, 1862), and in the following September he was again at the head of his division in the battle of Antietam where he was so severely wounded as to be unable to join his troops until after Burnside's disastrous defeat at Fredericksburg.

Under Hooker he was given the Sixth Corps, with which his fame is indissolubly connected and at the head of which he died. On 30th April 1863 Sedgwick had placed the left wing of the army, consisting of 22,000 men, across the Rappahannock south of Fredericksburg, while Hooker had thrown his right upon Chancellorsville in Lee's rear. On Sunday 3d May, the Sixth Corps occupied the town, scaled with heavy loss Marye's heights, before which Burnside had met his sanguinary repulse, and pursued the enemy to Salem Church, where the resistance encountered put an end to further advance on that day. Hooker's inertness now left Lee at liberty to concentrate a superior force upon Sedgwick's front, and both sides passed Monday in entrenching and desultory skirmishing. At night Sedgwick recrossed the river at Banks's ford and his troops were safe after a loss of 4600 men. In the pursuit of Lee's army when it invaded Pennsylvania Sedgwick led Hooker's right. When the battle of Gettysburg opened on the 1st July he was at Manchester in Maryland thirty-four miles away and where Meade intended at first to intercept the Confederate retreat. The next day at noon the Sixth Corps began to arrive on Round Top having accomplished the forced march in twenty hours. In Meade's operations along the line from Bull Run to the Rapidan Sedg-

wick captured on the 7th November a large number of Confederate troops at Rappahannock Station. Under Grant he marched into the Wilderness with his old corps and participated in the daily stubborn fights of that campaign from the 5th to the 9th of May. On the latter day, while directing in person the position of advanced batteries at Laurel Hill near Spottsylvania Court House, he was killed by a sharpshooter to the deep sorrow of the whole army. A monument commemorating his exploits and his virtues has been erected at West Point of cannon taken in battle by his old corps.

SEGUIN, Édouard (1812–1880), the accepted founder of the modern system of training imbeciles, was born (20th January) in Clamecy on the Yonne river in France, and died in New York, 28th October 1880. Others before him had attempted to treat idiocy, notably his early preceptor Gaspard Itard, but these experiments practically were futile because they were either subordinated to some psychological research or had no scientific method. It was Itard however who inspired Seguin with the belief that idiots were susceptible of education and the old doctor turned over to his young pupil his notes and observations. After Belhomme and Voisin had failed in Paris, and after the partial experiments at the mute asylum in Hartford, Connecticut, had become a disappointment, Seguin, who had spent several years associated with Étienne Dominique Esquirol in the investigation of imbeciles, opened a school for them in the Faubourg St. Martin, Paris, in 1838. Six years later a committee from the French Academy of Sciences, after a critical examination of his methods and results, pronounced Dr. Seguin to be the first who had solved the problem of the training of idiots. His method is known as the physiological one and is based upon the relation of organs to their functions. First of all each bodily organ is to be perseveringly taught to perform the normal functions in which it is deficient by mechanical contrivances, by imitations, by object-lessons and by music or other appropriate sounds. On this basis is superimposed training in moral and social duties as the pupil becomes susceptible to it, and the system is now virtually adopted in Europe and America.

Dr. Seguin's youthful enthusiasm was early entangled in Saint Simonianism which Bayard was then expounding in Paris, and the political disturbances of 1848 naturally turned his mind to the United States, whither he soon came to reside. He visited the Massachusetts schools for feeble-minded in Boston and Barre, which were founded in 1848 to apply his methods, and he joined Dr. H. R. Wilbur at Albany in establishing the New York State Idiot Asylum soon after located at Syracuse. Connecticut, Ohio and Pennsylvania are also indebted to his humane labors for the founding of similar institutions. Dr. Seguin resided in Portsmouth, Ohio, and in Syracuse and Mount Vernon, New York, for about three years each, but in 1863 he settled permanently in the City of New York.

In more strictly medical labors Dr. Seguin devoted much attention to the pathological relations of animal heat, inventing the physician's thermometer and publishing an edition of C. A. Wunderlich's *Medical Thermometry* (1871) with his own observations added. His classical works in the pedagogics of the defective are *Traitement Moral, Hygiene et Education des Idiots* (Paris 1846), and *Idiocy and its Treatment by the Physiological Method* (N. Y. 1866). From his pen came two volumes making a critical estimate of the life and methods of J. R. Pereira (1847) the first Spanish teacher of deaf mutes and the father of two of Seguin's Saint Simonian friends. He published other works in French and English relating to the great pursuit of his life, and there are two extant volumes of his own in English on *Medical Thermometry*. The United States' Bureau of Education sent him as a Commissioner to the Vienna Exposition of 1873, and three years later his report was given to the public.

SEMMES, Raphael (1809–1877), an American Confederate naval officer, was born in Charles county, Maryland 27th September 1809. He entered the United States navy in 1826, was admitted eight years later to the bar in Maryland, commanded and lost the brig Somers at the siege of Vera Cruz and accompanied the army to the City of Mexico. In 1855 he was commissioned commander, and was afterwards secretary of the Light House Board, a position which he resigned on the outbreak of the civil war when he went to New Orleans and took command of the Confederate side-wheel steamer Sumter, with which he ran the blockade at the mouth of the Mississippi 30th June 1861. After capturing several merchant vessels he sailed to Southampton, England, and thence to Gibraltar followed by the United States steamer Tuscarora and so closely blockaded that he sold his vessel. The famous Alabama, an eight-gun steam sloop, was then built at Birkenhead, England, and in August 1862 at the Azores Semmes took command. With an English vessel, English armament and English crew he undertook to sweep American commerce from the seas. Instead of sending prizes into port he destroyed most of the vessels which fell into his hands. After cruising in the customary track of trade in the North Atlantic he went to the West Indies and on 11th January 1863 sunk the United States gunboat Hatteras, carrying four light guns, off Galveston, Texas. Then sailing to the East Indies he continued his work of destruction until he had captured in all sixty-five vessels. After the Alabama returned to the Atlantic she entered the port of Cherbourg, France, where she was discovered by Capt. Winslow of the United States steam-sloop Kearsarge, which carried seven guns and was of the same tonnage. On June 19th a battle of an hour's duration was fought between them in the English Channel, and when the Alabama began to sink Semmes surrendered, but afterward threw his sword into the sea and escaped by swimming to an English pleasure-boat which, carrying the flag of the Royal Yacht Squadron, bore him to Southampton. He then found his way to Mobile where he was arrested at the close of the war and imprisoned for a few months. His latter years were passed in practising law at Mobile, in teaching moral philosophy in Louisiana and in lecturing upon his exploits. He died at Point Clear, Alabama, 30th August 1877. His adventures are recounted in his *Memoir of Service Afloat during the War between the States* (1869), and in his *Cruise of the Alabama and the Sumter* (1864). He also wrote *Service Afloat and Ashore during the Mexican War* (1851), and *Campaign of General Scott in the Valley of Mexico* (1852).

SETON, Elizabeth Ann (1774–1821), the foundress of the Sisters of Charity in the United States, was born at New York, 28th August 1774. She was the daughter of Dr. Richard Bayley an eminent physician and grandfather of the late archbishop of Baltimore. In her twentieth year she was married to William Seton, whose failing health sent them nine years later to Italy, where, after having been subjected to a month's detention in a wretched lazaretto at Leghorn he died. The widow, who had been trained in the Episcopal Church under the Rt. Rev. Dr. Hobart, was deeply impressed with the kindness of the Filicchi family in whose residence her husband died. Through their influence she joined the Roman Catholic Church on her return to New York. In 1808 she removed to Baltimore and opened a school for girls, and on the following New Year's day she took the conventual veil devoting herself to the service of the poor. In June the sisterhood which she had formed removed their school to Emmitsburg, Maryland, which, under the name of St. Joseph's Academy, remains the mother-house of the Sisters of Charity in the United States and has grown to be the largest educational institution in the State. Mrs. Seton never relaxed the rigid observance of the rules which she had framed for

her community. In 1814 some of the sisters were sent to assist in an orphan asylum at Philadelphia, and three years later to do a like service for New York. In 1820 Mother Seton's health failed and on 4th January 1831 she died. Her life has been written by Rev. A. J. White (1853), and by her grandson Bishop Robert Seton (1869).

SEVIER, JOHN (1744–1815), first Governor of Tennessee, was of Huguenot descent, the ancestral form of the name having been Xavier. His birthplace was in the Shenandoah valley. When he was twenty-five years of age he joined the Watauga Association of settlers in the Holston valley of Eastern Tennessee—an association formed in 1769 and with which his early career is closely connected. Of adventurous and enterprising spirit he was given colonial commissions to repress Indian depredations on the frontier and fought against the Shawnees at Point Pleasant (1774). When the Revolutionary war began the Watauga settlers organized Washington district with the approbation of the North Carolina legislature, placing Sevier at the head of a court for the settlement of disputes, sending him as delegate to a State convention in Halifax, and raising a regiment under his command. With these troops he defeated the hostile Indians in eastern Tennessee in 1776 and 1779, and took so gallant a part in the capture of the British under Colonel Ferguson at King's Mountain, 7th October, 1780 as to receive a sword and thanks from the legislature of North Carolina.

In the short-lived history of the State of Franklin (1785–87), which grew out of the provisional cession by North Carolina to the United States of her territory west of the mountains, Sevier presided at its constitutional convention at Jonesborough and was elected its governor, but upon the expiration of his official term no successor was chosen, and the people returned to their old State allegiance. During his administration Sevier repressed an Indian insurrection.

In 1790, the cession having been accomplished, Congress organized "The Territory Southwest of the River Ohio," and Sevier was commissioned brigadier-general. In 1793 he destroyed the Indian town of Etowah in Georgia, this being the last of his thirty-five battles. Next year he was a member of the legislative council, and in 1796 when Tennessee was admitted into the Union Sevier was again elected governor and with the exception of two years spent in private life he held the office until 1809. In 1811 he was sent to Congress where he served two terms. In 1815 he was one of the United States Commissioners to determine the boundary of the lands ceded by the Creek Indians, and while employed in this duty he died, 24th September 1815, at Fort Decatur, Georgia.

AMBROSE H. SEVIER (1802–84) migrated from Tennessee to Arkansas, participated in its territorial organization, represented it as delegate to Congress, and was twelve years a United States Senator. He was also a commissioner to make peace with Mexico in 1848.

SEWALL, SAMUEL (1652–1730), colonial chief justice of Massachusetts, was born at Bishopstoke, England, 28th March 1652. His father Henry had been one of the first settlers of Newbury, Massachusetts, but had returned to England. He again settled in Newbury in 1659, and his son Samuel after graduating at Harvard in 1671 became a resident fellow and librarian of the college. He studied divinity, but his marriage in 1676 with the daughter and heiress of John Hull, a wealthy goldsmith, drew him into his father-in-law's business. In 1681 he had also the management of the printing press at Boston, and in 1684, when his wife had come into her fortune, he was made an "assistant" in the government of the colony. Having acquiesced in the forfeiture of the colonial charters he sailed in 1688 for England, and while there the government of Sir Edmund Andros was overthrown. Though Sewall took no open part in this movement, he is generally regarded as one of the authors of a pamphlet in its defence. It was in his court, during the first year that he sat upon the bench, that some of the poor victims of the Salem witchcraft frenzy were tried, but five years later compunctions of conscience for his part in these events led him to make a public confession in church of his error, and to ask forgiveness of God and men. He was a judge of the Superior court for twenty-six years and chief-justice of the colony for ten years (1692–1728). He died 1st January 1730. *Answer to Queries Respecting America* (1690), *Accomplishment of Prophecies* (1713), *A Description of the New Heaven* (1727), are volumes from his pen; but more interesting than any of these is his *Diary*, edited by his descendant Joseph Sewall and published by the Massachusetts Historical Society in 1878. It embraces the record of forty years of colonial history. Sewall contributed liberally for the Christianizing of the Indians, and advocated the abolition of negro slavery, arguing that there would be "no progress in gospelling" till slavery was removed.

His son JOSEPH SEWALL (1688–1769), a learned divine, became assistant minister in the Old South Church, Boston, and in 1724 declined the presidency of Harvard College, to which he afterwards gave a fund for the benefit of indigent scholars. His only publications were sermons,

STEPHEN SEWALL (1704–1760), cousin of the preceding, was born at Salem, graduated at Harvard College where he taught for a while, and was a judge of the Superior Court from 1739 to 1752 when he became chief-justice and a member of the colonial executive council.

JONATHAN MITCHELL SEWALL (1745–1808), nephew of Chief-Justice Stephen and a distinguished lawyer, is best known by his patriotic and political poems. His *War and Washington* stirred the hearts of the Revolutionary soldiers and later pieces were printed in the Federalist newspapers throughout the Union. In his "Epilogue to the Tragedy of Cato" (1778) occurs the once popular couplet:

> "No pent-up Utica contracts our powers,
> But the whole boundless Continent is ours."

His lyrics were published in a volume in 1801. His death occurred at his residence in Portsmouth, New Hampshire.

Another SAMUEL SEWALL (1757–1814), chief-justice of Massachusetts and great-grandson of the colonial chief-justice of the same name, was born 11th December in Boston, graduated at Harvard in 1776 and practiced law at Marblehead a town which he often represented in the State legislature. In 1797 he was elected to Congress, in 1800 was judge of the Massachusetts Superior Court and in 1813 became chief-justice but died six months after at Wiscasset, Maine.

SEWALL, STEPHEN (1734–1804), who belonged to a Maine family of which several members became distinguished in professional life, was esteemed to be among the foremost classical and oriental American scholars of his time. Born at York, Maine (4th April) he earned at carpenter's trade the means of his education, was graduated at Harvard in his twenty-eighth year and passed twenty years from 1765 in the service of that college as the Hancock professor of Oriental languages. He was a warm supporter of the American Revolution and represented Cambridge during that period in the State Legislature. To the once famous *Pietas et Gratulatis*, which testified the grief of Harvard at the death of George II. and hailed the accession of his grandson, he contributed seven poems. He published *Carmina Sacra* (1789) and other Latin lyrics, a *Hebrew Grammar* (1763), two Biblical treatises, and left manuscripts now in the Harvard Library, among which are a Greek and a Chaldee lexicon.

SEWING MACHINES IN THE UNITED STATES. Over five thousand patents have been issued in the United States to cover devices for machine sewing. Of

these but few are essential to the construction of an efficient implement, nor has the invention of any single patentee been sufficiently complete to permit the production under his specifications of an apparatus of commercial importance. Two facts have governed the development of the American sewing machine; the first was the dependence of inventors upon their predecessors and upon each other for those suggestions necessary to a successful mechanism, the second is a law of industrial utility, under which a selection of the most efficient devices has gone on, bringing the production of different manufactures into greater similarity. Upon the expiration of letters-patent which protected the parts essential to a working machine the distinction between the products of various factories became less one of superiority in economy or ingenuity as tested by the same kind of work, and more one of especial adaptations to different materials and to the requirements of various trades. Thus by a law of commercial selection thousands of devices created by minds predestined to mechanical invention, and thousands of others produced in the manufactories with a view to raising questions of infringement and to prolonging their monopoly, have been of no practical value, and but few types of successful machines survive.

As all inventions for mechanical sewing necessarily turn upon the method of looping or knotting thread in a seam upon the pieces of fabric to be joined, it is evident that machines may be classified by the kind of stitch which they make. Some of these are more curious than valuable, having never reached any industrial end. They were tentative experiments and need but brief mention. Of the stitches now in use there are two varieties of the *chain*, two of the *lock*, and one *button-hole* stitch, Whatever improvements have been made in the devices for forming them, both the chain and the lock stitches were successfully made by mechanical appliances before any patent was issued by the United States for a sewing machine, unless that granted to Lyle in 1826, of which the records were destroyed by fire ten years later, was an exception.

Tentative experiments.

The earliest invention of which a record is preserved in the Patent Office at Washington was a device of John J. Greenough for sewing seams in leather or other hard material. It made either a running or a back-stitch and employed the mechanism of clamps to hold the material, of a needle pointed at both ends with an eye midway of its length, and of pincers acting automatically on either side of the material to draw the needle through it in each direction. An awl punctured a passage in the material for the needle, a broken length of thread was employed, and a rack carried the work either continuously forward to form a running, or alternately backward and forward to make a back-stitch, as far as the length of the bar would permit, when the rack and material were drawn back for readjustment. This patent bears the date of 21st February 1842; but few machines of this construction were ever sold. Twenty-four years earlier a mechanism producing the same kind of stitches was constructed by John A. Dodge and John Knowles of Vermont which is said to have done good work, but which was not patented nor manufactured on account of the hostility exhibited by the sewing trades towards any inventions affecting their handicrafts.

Similar to Greenough's apparatus were those of George R. Corliss (27th December, 1843) and of F. R. Robinson (10th December 1850). Both these inventions used a double-pointed needle and the nippers; but in the Corliss machine two needles passed in unison through the same awl-made perforation of the material, making an interlaced running-stitch like that of a shoemaker's hand work, while the Robinson device made a variety of stitches and gained some celebrity, although its needle breakage was large.

Still another process of making the running-stitch was that of using small geared wheels to clamp, corrugate and feed the material in small plaits upon an ordinary threaded needle. For this a patent was granted to Benjamin W. Bean of New York, 4th March 1843, while in April 1850 David M. Smith of New Hampshire patented a mechanism for doubling the fabric to be sewn in such a manner that either a back or running stitch could be taken as desired. But the principle of crimping on fluted wheels and of forcing the fabric so corrugated upon a threaded needle had been divulged in England in the early part of the century. However none of these devices, except perhaps that of Robinson, ever came into industrial use and they were early abandoned.

As to priority of invention often attaching to some other person than the patentee it may be well to caution the reader here against the inference that the patentees copied the expedients of their predecessors. The problem of mechanical sewing was a very restricted one, and scarce half a dozen solutions of it were possible. It had long attracted the attention of ingenious minds, and numbers of them working independently must have hit upon substantially the same expedients, so that they were inventors thereof so far as their own minds were concerned, but not the originators thereof in industrial history. Moreover, restricted as the problem was, the mechanical difficulties to be overcome were very great. Many a clever contrivance only served to show where success was not to be sought; many an important artifice required a remodelling which its author failed to perfect before it had any commercial value. They are the true founders of this great industry whose improvements made the machine a real economy and whose sagacity introduced it into the shops and homes of the world. Hence the sewing machine is essentially an American product, because here it first became a thing of practical value.

Chain stitch.

A series of loops passed at intervals through the fabric, in which each loop interlaces with its predecessor and binds it in place, constitutes an early artifice for mechanical sewing. This has been variously called the tambour, the crochet and the chain stitch, and for many years was employed almost solely in embroidery. Seams made with this stitch readily ravel out backward from any point where the thread may be broken, an objection which has never been entirely overcome. An improved Thimonier machine was patented in the United States, 3d September 1850. Two types of machines produce the chain stitch, one working with a single thread and needle, and the other employing two threads and two needles reciprocating in unison. Of these the Willcox and Gibbs apparatus has carried the single thread, and the Grover and Baker machine the double thread chain to the largest commercial importance,

To J. B. Johnson and Charles Morey was granted the first United States patent for making the tambour stitch, which was done by means of an eye-pointed needle which passed through the fabric and engaged a loop upon a hook acting in combination with it. The device was assigned to I. M. Singer, whose policy it was to get control of as many mechanisms as possible with a view to reducing the competition to which his manufactures were exposed. He also became eventual owner of John Bachelder's patent of 8th May 1849 for a contrivance to make a chain stitch by means of an eye-pointed needle, looper-hook and fly, for the sake of the rotary-feed with which it was combined. William Wickersham, an ingenious mechanic of Massachusetts, in the years 1853 and 1854 patented in Great Britain and America a barbed crochet needle so constructed as to catch the thread from a guide on one side of the material, to draw it to the other side in a loop through which the needle next descended to bring up from below another loop and to interlace with it the former. He further improved this device, in order to fasten off the end of the seam and to prevent ravelling by retaining the loop upon his needle until it had been

carried twice through the cloth to the side whence it was first taken up. This he accomplished by a double barb upon his needle, one of which carried his loop upward and the other downward through the material. This invention became the basis of a successful machine for sewing leather with waxed thread. The first patent for the barbed-needle working in combination with a thread-guide to produce a crochet stitch was granted to O. C. Reynolds 14th May 1850. Devices similar to the Wickersham machine were patented to William Butterfield (4th July 1854) and to Sidney S. Turner (August 1854), the latter contrivance driving the needle upward and drawing the loop beneath the cloth.

The name of James E. A. Gibbs of Virginia appears thrice on the patent office records for sewing mechanisms before the distinctive feature of the famous Willcox and Gibbs machine was admitted to protection there on the 2d June 1857. Their contrivance employs the usual eye-pointed needle in combination with an ingenious rotating hook which revolves beneath the cloth-plate in combination with the needle and makes the twisted loop stitch. Subsidiary designs of course were attached to each machine regulating the thread delivery, the feeds, the tensions and the modes of actuating the several parts in combination. So far as these were influential in developing the successful typical machines they will be mentioned under their separate heads.

Of the double thread chain stitch, the Grover and Baker machine, once exceedingly popular but no longer manufactured by its patentees, is the most successful example. A partial explanation of its early popularity probably lies in the claim first made for it, that as it did not employ a shuttle it did not infringe the Howe patents. The feed mechanism of this machine, while a true invention of its proprietors, was an infringement upon A. B. Wilson's patent although an improvement, but this interference was compromised in the Albany agreement, of which more will be said anon. That which beyond dispute was novel and characteristic was the interlacing of two loops throughout the seam, making a firm, elastic and strong stitch, although it left an objectionable ridge upon the interlacing side. In this mechanism two reciprocating needles work in unison, one being the familiar vertical eye-pointed needle and the other, a characteristic device, being an interchanging curved needle working in a plane at right angles with the vertical needle, and interlocking loops one with another. The patent for this apparatus is dated 11th February 1851, and the mechanism and stitch appear to be absolutely original with the patentees. It was followed by the inventions of Otis Avery (October 1852 and May 1854) which employed two needles working at an angle through each other's loops in such a manner that the stitch might either be drawn to the centre or left on one side of the fabric. Other devices of an early date for making the double looped stitch were C. Hodgkins (November 1852 and March 1854), A. Hunt (December 1853), I. M. Singer (May 1854) and C. A. Leighton (July 1854), while W. H. Johnson of Massachusetts (March 1854) produced what was known as the belaying double loop stitch, by the combination of a single needle, a forked hook and an expanding lever.

Lock-stitch.

The manufacturing history of the sewing machine begins with the lock-stitch which is employed in by far the larger number of these mechanisms. In this type of machines an eye-pointed needle forms a loop of thread upon one side of the cloth, through which a second thread is passed, after which by means of tensions the interlocking of the threads is drawn up into the fabric.

Two methods are used for passing the lower thread through the loop of the needle thread, that of a shuttle carrying a bobbin and working in a race which was patented to Elias Howe, Jr. 10th September 1846, and that of a rotating hook formed on the circumference of a disk or wheel about an inch in diameter. The latter is the Wheeler and Wilson machine, for which the first patent was issued to Allen B. Wilson of Massachusetts, 12th August 1851, a gentleman who nine months before had invented a shuttle pointed at both ends with a view to forming a stitch with each reciprocation.

Howe.

By decree of the United States Circuit Court of Massachusetts in 1854 priority of invention was adjudged to Elias Howe, Jr., for the shuttle sewing machine.[1] He used a curved eye-pointed grooved needle in order that when the needle had penetrated the cloth the tension of the thread from the cloth to the eye might form the chord of the needle's arc, into the space between which the shuttle point could readily enter. This construction has been generally discarded for a straight needle, which is quite as efficacious and stronger. Howe also used a shuttle with a clipping piece to give tension to the bobbin thread and moving in a race, also a baster-plate moved intermittently by a toothed wheel and having projecting points on its edge upon which the fabric to be sewn was suspended. The cloth hung vertically, the needle vibrated horizontally, and when the baster-plate had passed its full length before the needle it was necessary to draw it back and readjust the cloth. In April 1845 he had constructed a machine which made a seam; three months later he sewed upon it two suits of woollen clothes. These machines had serious defects, of which the most formidable were the imperfection of the feed movement and the horizontal path of the needle. This type of mechanism never came into general commercial use, neither had Howe the means to set up its manufacture until its construction was superseded by improvements. He had involved his friends and reduced himself to severe penury before the ebb of fortune changed with his suits for infringement.

On 2d October 1849 a patent was granted to S. C. Blodgett and J. H. Lerow for a rotary shuttle, or one which drove the shuttle round a circular race with each stitch, which, while it had serious defects, did much to convince the public that mechanical sewing was practicable. One of these machines passed into the possession of William Bradford of New Bedford, against whom Howe brought an action for infringement, which was defended by I. M. Singer in 1852 as well as a subsequent suit tried in 1854. Singer had himself invented a shuttle machine in 1850 (patents 12th August 1851 and 13th April 1852), in which he substituted for the curved a straight needle moving in a direct vertical line instead of in the arc of a vibrating arm. He also had improved the feed movement and the thread tensions, and it was his contention that Howe's claim of an infringement could not apply to the eye-pointed needle and the shuttle because he had been anticipated by Walter Hunt in their application to machine sewing, and that his patent covered only his useless baster-plate and clipping piece. The Court held that Hunt had neither perfected nor disclosed his invention so as to invalidate Howe's claim, and "that for all the benefit conferred upon the public by the introduction of a sewing machine the public are indebted to Mr. Howe."

Matters had now progressed so far that no patentee nor proprietor controlled the number of devices requisite to build an economical and reliable machine for the market, and each leading house began violently to accuse its competitors of infringements. Their representatives had gathered at Albany in 1856 to try a number of these claims in Court, when a peaceable adjustment was made, by which Howe, Singer, Grover and Baker, and Wheeler and Wilson combined to license the use of any of their devices upon the condition that $15.00 should be paid into their joint-treasury for every machine so manufactured. The agreement was main-

[1] Howe's (1819–67) history has been favorably told by James Parton in the *Atlantic Monthly* for May 1867.

tained until the expiration of Howe's renewed patent in 1867, and under it new factories sprang up giving great impetus to the trade and conferring large fortunes on their proprietors. Among the early companies making the lock stitch, and not already named the Weed, the Parham, the Finkle and Lyon, the Florence, the Domestic, the Empire and the Ætna obtained celebrity.

While the typical devices for making the different varieties of stitch in use have now been described each machine requires nicely adjusted subsidiary parts. The methods by which the Grover and Baker and the Willcox and Gibbs machines dispense with the shuttle need not again be mentioned. In other machines the shuttle, feed and tension contrivances embrace all that is really necessary to satisfactory work.

Shuttle.

Apart from the Wheeler and Wilson discoidal shuttle the ordinary form of shuttle is externally shaped like the half of a cigar after longitudinal bisection. Its flat face, which contains a cavity to hold the bobbin of thread, plays against the side of the race into which the needle descends in order to bring its point into the needle loop as soon as it is formed. Various contrivances have been employed to propel the shuttle in its race, to supply it with thread and to regulate its delivery. At first the shuttle race lay parallel with the line of the seam to be made. The Blodget and Lerow patent drove it round a circle, and Dr. S. J. Parker introduced the transverse motion (11th April 1854), or in other words passed the shuttle back and forth at right angles to the feed motion greatly improving the evenness of the seam. But the most serviceable mechanism now in general use is the shuttle-cradle or carrier of Charles Parham of Philadelphia (21st November 1854). In this device the shuttle lies loosely in the carrier so that the needle loop may pass freely between them, while reciprocating motion is communicated to the carrier by lever and cam adjustments. By this contrivance the shuttle is relieved of friction, protected from oil and driven with more precision over a shorter track. There are various modifications of the form of the shuttle, depending on the method of inserting the thread cop or spool and of applying the tension. Howe's tension consisted in passing the thread under a clip riveted to the side of his shuttle. Singer's tension was produced by passing the thread through slots and eye holes on each side of the shuttle; in some instances a bobbin spool slips between springs within the shuttle, in others it lies free in the cavity, and still another device got rid of the bobbin altogether by winding the thread in cop or ball intended for insertion in the shuttle and from the centre of which delivery was made.

Feeds.

The feed of the original Howe machine was the baster-plate moved by a rack-bar as already mentioned, but it was cumbrous and inefficient. Bachelder's patent of May 1849 covered an endless apron revolving on cylinders worked intermittingly and furnishing a horizontal support to the material. At the edge of the apron nearest the needle points projected to enter the cloth and carry it forward under the needle. There was also a yielding pressure holder to act upon the upper surface of the material near the needle which automatically accomodated itself to the inequalities of the material, and a stripper to discharge the cloth from the points of the feed. Bachelder claimed the right to substitute a wheel or a cylinder for the endless apron, and called this continuous rotary device "a perpetual feed." This contrivance was a great stride towards success.

To W. H. Johnson is credited (April 1853) a wheel feed with a reciprocating vertical motion which clamped and released the material with each stitch taken. Singer's original machine had a wheel feed with an up and down motion which projected it above and retired it below the cloth-plate, to which he added later a yielding presser-foot to strip the material from the needle, on which grounds he claimed an infringement on the part of Grover and Baker who patented (June 1852) the square or four-motioned feed, in which a notched bar rose and fell through the cloth plate and advanced and receded alternately in a horizontal line, working in combination with a yielding pressure plate above the cloth. A similar device was incorporated into the Wheeler and Wilson machine, for which Wilson obtained a patent 19th December 1854, and this feed has become the one in general use. By a contrivance of O. G. Boynton (June 1854) the presser-foot was put under the control of a gauge by means of which it could be lifted from the cloth and the seam turned in any direction, a device used chiefly in heavy leather work, while S. S. Turner's feed (August 1854) permitted turning the material at pleasure without raising the presser.

Numerous forms of the feed adapted to different kinds of manufacture are employed, but the principle and development of them all has now been sufficiently exhibited. The invention of Walter Hunt (June 1854), in which the upper end of the needle was pivoted to the stock while its lower end was received by a grooved adjustable shoe below the table and rocked forward the length of a stitch, is rather curious than important.

Tensions.

To regulate the delivery of the thread and to take up the slack of the interlocked loops were adjustments vital to the industrial efficiency of the sewing machine. The tension upon the needle thread is controlled by friction pads regulated by set screws. The Howe machine had a lifting rod governed by guide pieces to open the loop through which the shuttle passed and then to tighten the stitch; the Singer machine took up the slack of the needle-thread after the loops were engaged one with another by a vibrating arm or rod reciprocating in unison with the needle shaft; and an automatic thread delivery similar to that employed on the Willcox and Gibbs machine was patented to James Harrison, Jr. in April 1854.

Having now passed over the contrivances essential to the leading classes of sewing machines, with a view to show how such an apparatus was perfected by the separate suggestions and inventions of many minds, a few ingenious but commercially unimportant mechanisms remain to be noticed. Wickersham (March 1854) produced a chain stitch machine with two needles and thread guides which made two parallel seams simultaneously, and D. C. Ambler eight months later secured an adjustment to regulate at pleasure the distance apart of such seams. The latter also at the same time patented a device for felling down seams or making a zig-zag stitch.

A curious but useless product was the invention of Thomas C. Thompson, who magnetized the shuttle in order to make it adhere to the face of the race. It became the property of the American Magnetic Sewing Machine Company, which also purchased Coon's feed for fastening the ends of seams by a reversed motion at the point to be secured,—a device still in use in the button-hole machine.

Button-holes.

The cost of the intricate mechanisms and the small demand for them have left button-hole machines to the single product of the Singer factory, which obtained and improved that of the Union Button-Hole Company. For most fabrics simple attachments suffice for purling opposed parallel edges, which are afterwards separated by a cut. Where the hole is opened first and involves a circular eye at one end the machine is complicated. Two threads are used; the edge of the opening is stiffened with a twist-cord and spread upon a distensive clamp. The needle descends alternately at a little distance back of and then directly over the edge, making with its own and the under thread a series of doubly interlacing loops. By cam adjustments the motions of the needle are retarded or hastened as the periphery of the opening requires loose or close stitching.

Henry L. Sweet produced in 1853 a guiding device for doubling binding over the edges of hats, shoes, etc., which is in general use both with chain and lock stitch machines. But attachments and modified forms of the typical mechanisms have become as numerous as the especial trade requirements in mechanical sewing.[1] (D. O. K.)

SEYFFARTH, GUSTAV (1796–1885) was a German-American archæologist. He came from Leipsic to the United States in 1855. His birthplace was Uebigau in Saxony, and at the Leipsic University where he was graduated he was a professor of archæology for twenty years. In the United States he was professor of archæology and exegesis in the Lutheran Concordia Seminary at St. Louis until 1871 when he removed to New York where he died, 17th November 1885. As an Egyptologist he claimed to have been the first to decipher the Rosetta Stone, and he vigorously contested the early phonetic system of Champollion as the key to the interpretation of hieroglyphics. His views have been sustained by Bey Heinrich Karl Brugsch, and his scientific methods endorsed by the Saxon University at which he was graduated and from which he received the degree of Doctor of Philosophy. A frequent contributor to learned periodicals Seyffarth published many works in German and Latin on subjects hermeneutical, theological, philological, mythological, historical and chronological, of which a preponderating number were upon the archæology of Egypt. He continued F. A. W. Spohn's treatise on hieroglyphics entitled *De Lingua et Literis veterum Ægyptiorum* and published a Memoir of its author. His *Grundsätze der Mythologie und der alten Religions geschichte* (1843) and his *Sacred Chronology* or *Untersuchungen über das Geburtsjahr des Herrn* (1846) raised so polemical a strife that he was glad to leave Leipsic. *Rudimenta Hieroglyphica* (1826) was one of his earliest productions as it was characteristic of his methods. His English publications are *Recent Discoveries in Biblical Chronology* with reference to Abbott's Egyptian Museum (1857), followed by a refutation of chiliasm (1861), *Clavis Ægyptiaca* or a *Collection of Bilingual and Hieroglyphic Inscriptions* and other works on chronology.

SEYMOUR, HORATIO (1810–1886), Governor Seymour was the Democratic candidate for the presidency of the United States against General U. S. Grant in 1868, and he was the governor of the State of New York during the latter half of the civil war (1863–65) when, as the representative of the political opponents of President Lincoln in the most populous State of the Union, an excited interest was widely felt in his administration. His family were of Connecticut origin of which several members were eminent citizens of Litchfield county, but his father was one of the pioneer settlers in the virgin territory of central New York, where his son Horatio was born (31st May) in the agricultural township of Pompey in Onandaga county. In early childhood he was removed to Utica where, and on a paternal farm near which, his private life was passed, colored by the suavity, culture and influence of the wealthy country gentleman.

Admitted to the bar at the age of twenty-two he early participated in politics, was for six years on the staff of Governor W. L. Marcy, served four terms in the State Assembly of which he was once Speaker, was mayor of Utica in 1842, was the defeated Democratic candidate for governor in 1850, but succeeded in gaining that office for the next legal term during which he vetoed a bill for the suppression of the liquor traffic, in consequence of which action he was beaten in the race for the ensuing term by Myron H. Clark, the nominee of the Whigs and Prohibitionists. During his next gubernatorial term (1863–65) the gloom and apprehension of the North on account of the events of the civil war reached their highest point. Governor Seymour was the advocate of a policy of conciliation towards the Confederates in opposition to the war measures of the General Government. While, at the request of Secretary Stanton, he sent 12,000 militia out of the State to resist General Lee's invasion of Pennsylvania, he proposed to suspend recruiting the army by draft until the constitutionality of the Conscription Act passed in March of that year should be decided by the Supreme Court of the United States. While the city was depleted of troops sent to check Lee's advance at the Susquehanna river the draft riots broke out with the destruction of the building used by the conscription officers, and it overpowered the authorities for four days (*v.* vol. xvii. p. 895). On the second day Governor Seymour entered the city and from the steps of the city-hall and at other insurrectionary points urged the turbulent mobs to disperse. He also began a military organization of the city to restore the reign of law, but the arrival of veteran troops from the Army of the Potomac and of the returning militia was followed by submission to legal authority after the destruction of $2,000,000 in property. The next year the governor urged in vain the payment of interest upon the State bonds in gold which was then at a high premium. From the close of this term he held no office of political importance. Upon his renomination in 1864 for the next term of governorship he was defeated, and four years later when he contested the presidency with General Grant he received 80 out of 294 votes in the electoral college. In 1874 he declined to contend for the United States Senatorship, but continued to enter spiritedly into the election campaigns of his party as long as his health would permit. In the retirement of private life Governor Seymour was an efficient member of several agricultural and philanthropic societies,—a life which ended on the 12th February 1886 at the residence of his brother-in-law, Roscoe Conkling of Utica.

An uncle of Governor Seymour who bore the same name (1778–1857), though born in Litchfield, Connecticut, became a Vermont probate judge, which State he represented as a Whig from 1821 to 1833 in the United States Senate. His residence was at Middlebury.

Of remoter kindred was Origen S. Seymour (1804–1881) of Litchfield, Connecticut. Twice he served in the House of Congress (1851–54) and immediately thereafter became a judge of the Superior Court of his native State, passing in 1870 to the Supreme Court bench, of which three years later he was the chief-justice. As a jurist he was noted for his sound perception of equities.

SHAW, HENRY WILLIAM (1818–1885), an American humorist known as "Josh Billings," was born at Lanesborough, Berkshire, Massachusetts. His father and grandfather had both been members of Congress, but the former lost the favor of his constituents by voting for the Missouri Compromise in 1820. At the age of fifteen Henry went to the West where he spent twenty-five years in farming and auctioneering. About 1858 he settled in Poughkeepsie, N. Y., where he followed the latter business. In May 1863 under the name of "Josh Billings" he published a sketch whose rough humor, quaintly set off by bad spelling, secured it a wide circulation in the newspapers. Others followed, and soon the author was entirely occupied in writing and lecturing. His *Almanax* filled with pithy proverbs showed as deep insight into human nature as that of Franklin's *Poor Richard*. Several volumes of his sketches have appeared. He died at Poughkeepsie, 14th October, 1885.

SHAYS, DANIEL (1747–1825), the leader of a rebellion in Massachusetts in 1786, was born at Hopkinton in 1747. He fought at Bunker Hill and was afterwards a captain in the Revolutionary army. In 1786 the poorer people of Massachusetts, suffering greatly

[1] The editor of the supplement is indebted to Charles Parham of Philadelphia, the inventor of the shuttle carrier, for all the important facts and views contained in this article.

from the burdens incurred in the war, charged their troubles upon the extravagance and aristocratic character of the General Court which they wished to remove from Boston. They also desired the issue of paper money and the arrest of judicial executions under obnoxious tax laws. Insurgents took possession of the court-house at Northampton in August, and in December Shays led considerable forces into Worcester and Springfield and prevented the courts from sitting there. The disorganized rabble suffered severely from the intense cold, and soon learned with dismay that an effective militia force called out by Governor James Bowdoin was marching against them. Even Shays was ready to surrender if assured of a pardon. However, he led the insurgents against the arsenal at Springfield which General Shepard was holding with 1200 men. His attack, made on 25th January 1787, was repulsed and his forces driven into confusion with the loss of three men. In a few days General Benjamin Lincoln, commander-in-chief of the State troops, by a vigorous pursuit surprised the rebels at Petersham and completely dispersed them. Shays found refuge in Vermont and was afterwards pardoned on his own petition. Still later he was allowed a pension for his services in the Revolution. He settled at Sparta, N. Y., where he died September 29, 1825. (See G. R. Minot's *History of the Insurrection in Massachusetts in* 1786, Boston, 1810.)

SHELBY, Isaac (1750–1826), an American soldier and statesman, was born at Hagerstown, Maryland, 11th December 1750. His father was a militia general, and the son, after receiving a moderate education, became a surveyor in Virginia and North Carolina. He accompanied his father in an Indian campaign in 1774 and during the Revolutionary War rose to be colonel. His chief exploit was the defeat of Major Ferguson, the British commander at King's Mountain, 7th October 1780, by which the plans of Cornwallis were disconcerted and for which he received a vote of thanks and a sword from the Legislature of North Carolina, of which body he was a member while at the same time serving under Marion and Greene. After the war he settled in Kentucky and took part in the movement for its separation from Virginia. Chosen the first governor of the new State in 1792 he was energetic and prudent in repressing Indian outrages and in quieting the disaffection towards the Federal government arising from its inertness in guarding the interests of the West. Again in 1812, he was called to the same office. In 1813 at the head of 4000 Kentuckians he joined General Harrison and shared in the victory of the Thames. His bravery was recognized by a gold medal from Congress. In 1817 President Monroe offered the veteran a cabinet position at the head of the War Department but he declined on account of his age. He served however with Jackson in 1818 in negotiating a treaty with the Chickasaws, and died eight years later on 18th July in Lincoln County, Kentucky. His name is perpetuated in the names of a number of western townships and counties.

SHELTON, Frederic William (1814–1881), an American clergyman, born at Jamaica, Long Island, and graduated at Princeton in his twenty-first year, published anonymously three years later *The Trollopiad, or Travelling Gentlemen in America*, a satire in rhyming pentameters. Other articles humorous and serious were contributed to the *Knickerbocker Magazine*. In 1847 he took orders in the Episcopal Church and thereafter had charge of parishes on Long Island, at Fishkill, N. Y., and at Montpelier, Vt. He died at Carthage Landing, N. Y., 20th June, 1881. His romances are: *Salander and the Dragon* (1851), the *Rector of St. Bardolph's, or Superannuated* (1853), and *Crystalline, or the Heiress of Fall Down Castle* (1854), a fairy tale opposing envious dipositions. *Up the River* (1853), and *Peeps from the Belfry* (1855), are sketches of rural and parochial life.

SHERMAN, Roger (1721–1793), one of the committee which drafted the American Declaration of Independence, was born at Newton, Mass., 19th April 1721. He began industrial life as a shoemaker, and by his trade supported his mother and her family after the death of his father. At twenty-two years of age he joined an elder brother in keeping a country store at New Milford, Connecticut. By his diligence in the pursuit of learning, especially of mathematics, he won the position of County Surveyor in 1745, and later he furnished the astronomical calculations to a New York almanac. His admission to the bar at thirty-three was soon followed by his election to the Provincial Assembly, and afterwards by a seat on the bench of the Common Pleas Court. New Haven appearing to be a better field for his political abilities he removed thither in 1761 and was soon again a Judge and also for nearly a score of years an assistant to the Governor, as the twelve councillors which then formed the Upper House of the Colonial Legislature were then called. In 1774 he took active part in the patriotic movement and was sent as delegate to the first Continental Congress. Besides his services in connection with the Declaration of Independence he assisted in framing the Articles of Confederation and afterwards the Federal Constitution. His reputation among his contemporaries is indicated by Jefferson's remark, "He never said a foolish thing in his life." Sherman was widely and persistently entrusted with office. He was at the same time and for years together Mayor of New Haven, Judge of the State Superior Court, and member of Congress. To these burdensome duties he added those of Treasurer of Yale College and a codifier of the State laws. In 1791 he entered the United States Senate, but died on the 23d of July in the second year of his term.

His nephew, Roger Minot Sherman (1773–1844), was born at Woburn, Mass., on the 22d May, graduated at Yale College in 1792 and admitted to the bar in 1796. He settled at Fairfield, Conn., and became distinguished in his profession. He was elected to the General Assembly in 1798, and was a delegate to that Hartford Convention of 1814 which ruined for many of its members the prospect of advancement in national politics. He was a Judge of the Superior and Supreme Courts for many years, dying on the 30th December 1844 after two years of retirement to private life.

The "Signer's" grandson John Sherman (1772–1828) was born at New Haven, graduated at Yale College in 1792 and settled in clerical life five years later at Mansfield in his native State. He published in 1805 the first formal defence of Unitarianism produced in New England under the title *One God in One Person Only*. He was afterwards pastor of a congregation at Trenton Falls, of which he published a *Description* (1827) and where he died on 2d August 1828. Besides some controversial pamphlets he gave to the press a new system of grammar called *Philosophy of Language Illustrated* (1826).

Another descendant Sidney Sherman (1805–1873) was a pioneer in lead manufactures in Kentucky, led the attack upon the Mexicans at the battle of San Jacinto, introduced railroads into Texas, served a term in Congress and organized the defences of Galveston in the civil war.

SHERMAN, Thomas William (1813–1879), an American general, was born at Newport, R. I., 26th March, 1813, where he died 16th March 1879. Graduated at West Point in 1836, he entered the artillery and fought in the Creek, Florida and Mexican Wars. He was also engaged in Minnesota in troubles with the Indians, and in Kansas during the Lecompton disputes. Lieutenant-colonel of the Fifth Artillery on 14th May 1861, he was within a few days advanced to be a brigadier-general of volunteers. He fought in the first battle of Bull Run, and in October following commanded an expedition to Port Royal, South Caro-

lina, intended to co-operate with the navy against Charleston. Sherman was transferred the next spring to a division of Halleck's army at Corinth and later he led a wing of Banks's army against Port Hudson, where he lost a leg. At the close of the war he was made brevet major-general and in 1876 was retired.

SHIRLEY, WILLIAM (1693–1771), one of the best colonial governors of Massachusetts, in his forty-first year left Sussex County, England, where he was born, and settled at Boston in the practice of law. While engaged in settling the boundary line in 1741 between Massachusetts and Rhode Island he received the king's commission as governor of the colony and filled that office until 1756 with the exception of four years (1749–1853) passed in England. He organized the expedition of New England troops which Colonel William Pepperell led in 1745 against the fortress of Louisbourg, and which gave temporary control of Cape Breton Island and the Gulf of St. Lawrence to the British. Returning from fortifying the line of the Kennebec river he was made commander-in-chief of the troops in British America on the renewal in 1755 of the French war. In this position he enforced the superiority of Washington's rank as a colonial colonel upon subordinate British officers holding royal commissions. Of the four columns organized to move against French posts from Nova Scotia to Fort Duquesne, Shirley led the one destined for the Niagara frontier as far as Oswego, where he was detained by lack of supplies, and whence he returned in the autumn leaving a garrison of seven hundred men in the forts. In Braddock's disastrous expedition his son William Shirley was killed. When the spring campaign of 1756 opened General Shirley was superseded by Abercrombie. Subsequently to the conquest of Canada he was for a time Governor of the Bahamas, but he returned in 1770 and settled in Roxbury where he died in the following spring. A son Thomas, who survived him nearly thirty years, became a baronet and governor of the Leeward Islands. Shirley was a man of literary tastes, and besides publishing journals of events in the French and Indian War, he produced a tragedy called *Electra* and a masque entitled *The Birth of Hercules*.

SHUBRICK, the name of four brothers distinguished in the United States naval service. They were sons of Colonel Thomas Shubrick (1755–1810), a patriotic resident of Charleston, South Carolina, who had in the Revolutionary War served on the staffs of Generals Greene and Lincoln, and who lost two other sons in the army during 1813.

JOHN TEMPLAR SHUBRICK (1778–1815), entered the navy in 1806 and was on board the Chesapeake in her action to resist the impressment of her seamen in 1807 by an officer of the Leopard; he served on the Constitution when she captured and burned the Guerriere in August 1812, and also when four months later she whipped the Java off the Brazilian coast; he served under Lawrence when the Hornet sunk the Peacock in the following February, and he was captured with the President when she ran the blockade of New York in 1815. Commodore Decatur sent him home with despatches from the Algerine war in command of the Epervier, but the vessel was never afterwards heard from.

WILLIAM BRANFORD SHUBRICK (1790–1874) left Harvard to enter the navy at the same time with his brother John, and was lieutenant under Stewart when the Constitution on the 20th February 1815 captured the Cyane and Levant off the island of Madeira, the latter of which vessels he brought home as a prize. After varied land and sea service he obtained command of a squadron in the West Indies in 1838. During the Mexican War he was chief officer of the Pacific fleet, captured Mazatlan and sustained General S. W. Kearney's efforts to organize a government for California. After duty on the Lighthouse Board and in preparing regulations for the navy he was sent out in charge of the Brazilian Squadron in 1858 and the next year ordered to conduct an expedition against Paraguay to demand reparation for the firing upon the United States exploring steamer Water Witch. His sea service then ended, and in 1862 he was commissioned rear-admiral passing the rest of his days in Washington where he died on 27th May 1874.

EDWARD RUTLEDGE SHUBRICK (1794–1844) entered the navy in 1809, became lieutenant in the war of 1812 and rose to the rank of captain in 1837. He held a command in the Brazilian Squadron in 1842 and died at sea 12th March 1844.

IRVINE SHUBRICK (1797–1849) entered the navy in 1814 as a midshipman under Decatur and was captured with him in 1815 when the President was taken by the blockading fleet off New York. He served in the Algerine war and rose through the several grades of rank until he became commodore in 1841. He died at Philadelphia 5th April 1849.
